The Selden Motor Vehicle Co., of Rochester, N. Y., has transformed its New York and Chicago branches, which were its only branches, into dealerships; the New York branch, at 1876 Broadway, was taken over this week by the Shepherd Motor Car Co., former dealer in Oakland and Everitt cars. Both pleasure and commercial cars will be handled. The Chicago branch is now a dealership in the hands of R. C. Crawford, the former branch manager; he is located at 1501 Michigan avenue, and since becoming the owner of the business has added the Metallurgique to his line.

The Union Electric Light & Power Co., of St. Louis, Mo., has withdrawn from the trade as a dealer in electrics and will confine itself to the production of electricity; General Vehicle trucks and Rauch & Lang pleasure cars, which it has sold for six years, will be handled by other representatives and the Electric Storage Battery Co. will secure a different distributor. The Union company's garage at 20th and Locust streets will be closed as soon as is feasible; C. E. Michel, former manager of the Union's automobile department, will, among other duties, act as an adviser to owners in automobile matters. The Union company entered the trade in order to stimulate the electric vehicle business in St. Louis and now feels that its mission has been accomplished.

Changes Among Prominent Tradesmen.

A. H. Smith has been promoted to the management of the Ford Motor Co.'s branch in Indianapolis. Previously he was assistant manager of the Ford branch in Cleveland.

Frank B. Hutchinson, Jr., has been appointed advertising manager of the Kelly-Springfield Motor Truck Co. of Springfield, O. Previously he was identified with two Eastern trade journels.

Fred J. Wagner has been elected president of the Right Oil Co., of New York, to succeed A. R. Pardington. Wagner only recently assumed the general management of the company, in which at all times he has been financially interested.

C. A. Swinehart has resigned the office of sales manager of the Swinehart Tire & Rubber Co. of Akron, O., his resignation to take effect February 1st. He has formulated no definite plans for the immediate future, but expects to remain in the tire business.

R. S. Hartzell, formerly with the Goodyear Tire & Rubber Co.'s branch in Detroit, has been elevated to the management of the Goodyear establishment in Cleveland. He succeeds M. Hammerle, who has been promoted to the Goodyear district office in Detroit.

Porter R. Walker, at one time connected with the Lion Motor Car Co. and later with the Grant Motor Car Co., has been appointed a special representative for the Haynes Automobile Co. of Kokomo, Ind. He will circulate in the State of Pennsylvania.

As a result of the discontinuance of the Studebaker branch in Louisville, Ky., W. W. Beeson, its manager, has been transferred to Denver, Col. He will have charge of the Studebaker Corporation's wholesale branch, which handles Colorado, Wyoming and New Mexico.

Harry W. Ford having been promoted to the post of secretary and assistant general manager of the Chalmers Motor Co. of Detroit, his former chief assistant, Le Anderson, also has been advanced a peg He has assumed the duties and title of advertising manager.

D. W. Pinney has been promoted to the management of the Rambler branch in New York City. He succeeds to the vacancy created by the elevation of H. A. Field to the general sales management of the Thomas B. Jeffery Co., which carries with it his removal to the factory at Kenosha, Wis.

Stephen Nelson Bourne, 2nd, has been appointed manager of the Philadelphia branch of the F. B. Stearns Co. Previously he represented the Stearns interests as Western sales manager, and before becoming identified therewith he was for a number of years connected with the E. R. Thomas Motor Co. as a Western representative.

Minor Business Troubles.

A receiver has been appointed for the Kendle Motor Car Co., of Philadelphia, Pa. The bond required was $3,500.

William J. Tynan, of Paterson, N. J., an automobile dealer, has filed a voluntary petition in bankruptcy; he has liabilities of $19,655 and assets of $5,510.

Receivers in bankruptcy have been appointed for George G. Reed, who traded as the Reed Tire & Supply Co. at 749 Boylston street, Boston, Mass. His liabilities are $20,035 and assets, $13,365.

L. L. Taylor, individually and trading as the Union Auto Garage, in Jacksonville, Fla., has filed a voluntary petition in bankruptcy; he states that his liabilities are $5,189.60, of which $3,589.60 is in unsecured claims, and his assets $1,525, with a property exemption of $725.

John S. Harrington and Daniel A. Harrington, Jr., trading under the style J. S. Harrington & Co., in Boston, Mass., at 589 Boylston street, 26 Glenville avenue and 55 Bickerstaff street, have filed apetition in bankruptcy; their liabilities aggregate $50,225 and assets are estimated at $39,113.

Recent Losses by Fire.

Ballwin, Mo.—Frank Blinne, garage destroyed. Loss not given.

Meriden, Conn.—W. F. Bowe Garage and seven cars destroyed. Loss, $5,000.

Portland, Me.—Babb & Chase, 24 Taylor street, garage damaged. Loss not given.

Kosmak Adds Capital for Enlargement.

The Kosmak Electrical Co. of Jersey City, N. J., makers of the $3 Cubit horn, has increased its capital from $10,000 to $100,000. The new money will be employed so to enlarge the business as to permit an output of 1,500 horns per day.

Change of advertisements is not guaranteed unless copy therefor is in hand on SATURDAY preceding the date of publication.

Contributions concerning any subject of automobile interest are invited and, if adequate, will be paid for; or, if unavailable, will be returned provided they are accompanied by return postage.

Cable Address, "MOTORWORLD," NEW YORK

Entered as second-class matter at the New York Post Office, November, 1900

NEW YORK, JANUARY 16, 1913

WALL STREET'S AUTOMOBILE INTERESTS.

When the reorganization of the United States Motor Co. is completed and the new company takes possession of the property, according to one of those high in the councils of the organization, a policy of rule by fear will be instituted—the president will be in fear of the bankers, the vice-president will be in fear of the president, and so on down to the humbler employes.

The belief appears to exist that there were too many warm-blooded friendships existing in the old organization to achieve the best results. But with a rule by fear prevailing it will be interesting to discover of whom the bankers will stand in dread. It is reasonably certain, at any rate, that if someone or something will put the fear of God and fear of the law into their hearts that many things which occurred in the old company will be avoided, and that the way of the new organization will be made much easier and very much more satisfactory to all those with whom it may deal.

At least some of the bankers responsible for the previous conditions are identified with the reorganized company. It is known that they took a very intimate interest in the affairs of the old corporation and that very much of this interest centered in the nature of the reports which from time to time were put into print and that served briefly to affect the value of United States Motor shares.

Motor World does not share the belief expressed in at least one other public print, that the methods which prevailed were the methods of "second-story burglars," but it is perfectly apparent nevertheless that the men of Wall street are not vitally concerned with the actual manufacture and sale of automobiles. Their business is selling paper—that is, securities—at a profit, and it is equally clear that not all of them are particularly scrupulous how that end is attained.

With its enormous paper capitalization—$42,500,000—it was a common remark that the United States Motor Co. was practically waterlogged. Perhaps it is not water that some persons believe they discern in the $37,000,000 capitalization of the reorganized company—which has fewer physical assets than the old one and which is not in the strict sense a going concern—but if what looks like water is not water the bankers can perform a public service by pointing out just what it is. It is obvious to anyone that if men pay $24 or $25 per share for the stock of an embarrassed company and by reorganizing it are able by one means or another to increase its market value even 10 points, the profit that accrues is handsome enough to satisfy at least some of the less grasping followers of "the street."

Although some of them may be so blind that they will not see it is reasonably clear that the painting of "blue sky" and "rainbows" for speculative purposes will not long remain what it is, nor what it was. If it has served no other purpose, the congressional so-called "money trust" investigation let in a flood of light on the pastime or business of million-manufacture. As a result, it now is much plainer how it is possible for underwriters with the assistance of a chain of banks to float hundreds of millions worth of securities at substantially no cost and no outlay to themselves. The paper is passed on and on and paid for by the ultimate purchasers before the ships are really floated.

It may be argued that the internal affairs of be-millioned corporations — such, for instance, as the United States Motor Co.—are not properly a subject for comment by trade publications, such as Motor World. When, however, such corporations offer millions of their shares to the public, and utilize the automobile industry as a means of exploiting them—when this comes to pass, Motor World believes that such corporations cease to be private companies and become of both trade and public concern. Their affairs are of the trade and belong to the trade, and to us it seems that a trade publication which is not of the back-scratching sort can perform no greater service to the industry to whose welfare it is committed than by pointing out the evil, not merely in corporations but in the men who may comprise them.

The automobile industry has been over-exploited. It is feeling its effects. It is time to check reckless exaggeration and reckless extravagance. "Blue sky" and get-rich-quick methods no longer should be suffered to obtain. Motor World stands committed to this policy, and threats, foul-mouthed or otherwise, will not dissuade us from turning on the light whenever and wherever light will serve good purposes. We believe men who supply 100 cents' worth of goods and who expect 100 cents in return, not a compromise of 25 cents or 50 cents after the damage is done, will stand with us, as will the dealers whose interests also suffer from such blights.

March 1-8, Paterson, N. J.—Second annual show of the Paterson Automobile Dealers' Association.

March 3-8. Pittsburgh, Pa.—Pittsburgh Automobile Dealers' Association's show in Duquesne Garden.

March 3-15, Des Moines, Ia.—Des Moines Automobile Dealers' Association's fourth annual show in the Coliseum. First week pleasure cars; second week trucks.

March 10-15, Dallas, Tex.—Annual show of the Dallas Automobile Dealers' Association in the Fair Grounds Coliseum.

March 20-24, New Orleans, La.—Annual show of the New Orleans Automobile Dealers' Association.

Disagreeing Partners Ask Receiver.

Pending the dissolution of a partnership between William S. Rice, Thomas Hardy and Joseph Dunston, a receiver, upon application of Rice, was appointed last week for the Reliable Garage & Automobile Co., of 27 Orange road, Montclair, N. J. Rice alleges that Hardy leased a garage operated by the Reliable company to others, thereby virtually abandoning the business. A chattel mortgage figures in the case.

Newtone Makers Produce a $4 Horn.

Without intimation that anything of the sort was in contemplation, the Automobile Supply Mfg. Co. of Brooklyn, N. Y., which manufactures the Newtone motor driven horn, has placed on the market a vibrator horn, styled the Electra, which lists at the remarkably low price of $4. It is claimed that it operates on less current consumption than any other horn on the market—that is, one-half ampere.

Tire Exports Continue to Gain.

Shipments of tires from the United States during November, 1912, to the value of $275,360 marked a gain of $98,150, or 35 per cent., over $177,210, the value of the tires shipped abroad during the same month of 1911; for the first 11 months of 1911 the value was $2,257,727 and for the same period of 1912, $3,034,699, a gain of 34 per cent., slightly less than the November, 1912, increase

---

Remy Discontinues Indianapolis Branch.

Owing to the proximity of Anderson to Indianapolis, the Remy Electric Co. has discontinued its branch in the latter city and will care for its former patrons through the factory in Anderson, Ind. E. M. Jones, manager of the Indianapolis branch for the past two years, has been transferred to the home office, but he will cover his former territory.

Firestone Opens Two More Branches.

The Firestone Tire & Rubber Co. has opened branches in Milwaukee, Wis., and Memphis, Tenn. The former will be in charge of J. E. McGinnis, heretofore identified with the Firestone factory, while William Clark Waters, formerly with the Firestone branch in Indianapolis, will manage the Memphis establishment.

COL. POPE AGAIN LIONIZED AT M. A. M. ANNUAL BANQUET

Distinguished Veteran Arouses Enthusiasm of the Diners — Detective Burns One of the Speakers— Urges Civic Decency.

Colonel George Pope, chairman of the Board of Trade's Show Committee, was again the "lion" at the Motor and Accessory Manufacturers' annual banquet which occurred in the Waldorf-Astoria last night, 15th inst. As was the case last year, when the "good, gray Colonel," who was a guest of the occasion, arose to speak he was cheered and cheered and cheered again. When he concluded his remarks, there were more cheers, which finally merged into the singing of "He's a Jolly Good Fellow."

The banquet befitted its sponsors and was in keeping with the character of its predecessors. Everything connected with it was exceptionally well arranged and of a high order, which characterization applies even to the cabaret show with which the 450 diners, seated at 57 tables, were entertained from the moment they entered the hall until the speechmaking began. And there was not too much of the speech-making. In all, there were but four addresses delivered, respectively, by George McAneny, president of the Borough of Manhattan, who substituted for Job E. Hedges; by W. J. Burns, the famous detective; by T. O. McGill, a former president of the once noted "Amen Corner," and by Colonel Pope.

The post-prandial exercises were opened by an introduction by H. T. Dunn, president of the Motor and Accessory Manufacturers, who turned them over to Howard E. Raymond, a past president, who was programmed as toastmaster, but who, with a few words, transferred the gavel to Wilbur D. Nesbitt.

The only thing that served to mar the occasion was the undue noise which prevailed. There were those who were so overflowing with good spirits that they could not contain themselves. While Mr. McGill was speaking, the noise became so loud that he abruptly terminated a witty address on the subject of "Parts" and left the room, which caused Mr. Raymond to arise and rebuke the noise-makers in short but emphatic language.

President McAneny was the first speaker. He dwelt on some of the problems facing the government of the City of New York, including the work of road and street improvement, and leading up to it he, in humorous fashion, briefly observed that originally the Island of Manhattan had been sold for $24 to Peter Minuit by the Indians while they were in a drunken stupor, and he added with a smile that it probably had given to Manhattan the meaning "a place of general intoxication," which was attached to it by the Indians when they realized the folly of their bargain.

Detective Burns delivered a characteristic talk on the value of organization and its relation to industry in general, and made the most of the occasion to awaken those present to sense of civic decency. He referred to the awakening of the public conscience, as indicated by the echoes from all over the country of the convictions of lawless elements, and said that, in his opinion, the American people of today owe their greatest thanks to the passing of the period when this lawless element "can take human life and get away with it." He declared that such men as those represented by the Motor and Accessory Manufacturers should interest themselves energetically in public questions and personally see that unfit characters are not permitted to assume public office.

Then came Colonel Pope and the cheers. When they subsided, he remarked that to him the banquet appeared more like a social gathering than a formal function for business men, for he had met so many of those present and done business with them for so many years that he looked upon them as social acquaintances. He facetiously remarked that he would not tell how many years he had done business with some of them, not that he was ashamed to tell how old he was, but for fear he might hurt the feelings of some of the apparently younger men if he exposed their ages.

In a chatty, informal way, the Colonel reviewed experiences with some of these men and remarked that such organizations as the M. A. M. are necessary because of the great value growing out of the personal association of man with his kin. In his most serious vein, Colonel Pope stated that while in such organizations it sometimes may seem that a particular member, or group of members, may be discriminated against, it is necessary for all of them to look at the broad fact that the rule of the greatest good for the greatest number must always obtain.

In addition to Messrs. Dunn, Raymond, Nesbitt, McAneny, Burns, McGill and Pope, those seated at the guests' table, or directors' table, as it was termed, were the following directors of the M. A. M.: J. H. Foster, C. E. Whitney, F. C. Billings, H. W. Chapin, L. M. Wainwright, D. J. Post, Charles T. Bryne, E. S. Fretz, William H. Crosby and Thomas J. Wetzel; and also these guests who did not speak: Samuel A. Miles, Merle L. Downs, A. G. Bachelder, H. A. Bonnell, James S. Marvin, Sidney B. Meyers and T. E. A. Barthel.

HOOSIER "BOOSTERS" MAKE REVELRY AT CONEY ISLAND

Part of Program of Placing Indiana Larger on the Map—Dinner of Big Village Boosters Tinged with Frost.

Although Coney Island, which, as all New Yorkers and some who are not New Yorkers, know, is not quite as Coney Islandish now as it is when summer breezes blow, it is a plentifully joyous place when a crowd of joyous souls get together with no other thought than to have a good time. At least, the Hoosiers who are in New York's "midst" from far-away Indiana think so, and they ought to know, for they were down there on Saturday night last in force, the occasion of the visit being a dinner and entertainment that is only one of the many social functions which are ushered in each year with the National shows and which serve to relieve the tedium and monotony of business.

The Hoosiers, including a number of the more prominent men whose names are a power in the Indiana automobile industry, are in New York for a three-fold purpose, and they came in a special train. They are in New York to see the show, to put Indiana on the map—as is attested by the full-page "Boost Indiana" advertisements that have appeared in most Metropolitan journals; and they are in New York to have a good time.

Last Saturday night, however, they just let business go hang, and from four o'clock until midnight they inhaled whatever salt sea air filtered in through the tobacco smoke in Henderson's restaurant at Coney Island, and later at Stauch's, and altogether they had quite a gay time. As early as 10 o'clock in the morning, a stream of automobiles carrying happy Hoosiers headed toward Brooklyn, and when by four o'clock the number assembled had reached close to 200, caps and aprons were dealt out and the assault on the sea food was commenced. For upward of four hours the battle waged, when the retreat was sounded and the crowd undertook a forced march around the corner to Stauch's, where a private ballroom had been requisitioned and where the cabaret show was continued. Homer McKee, of the Cole cohorts, was the master of ceremonies at the dinner and contributed a humorous menu as well. John Guy Monihan of the Premier forces in Indianapolis was the "boss," however, the whole entertainment having been arranged for the Hoosiers by Captain Stratton of the Colt-Stratton Co. of New York and C. J. Maxson, the Brooklyn Premier representative.

Digitized by Google

Another social function that had been looked forward to with pleasant anticipation for some little time, though events as they transpired proved that it came very far from realizing the ambitions of those who had it in hand, was held on Tuesday night at the Murray Hill Lyceum. It was the Big Village Motor Boosters' beefsteak dinner, and though it had been widely advertised by word of mouth and through the columns of the daily papers, not even the presence of such distinguished pioneers of the industry as Charles E. Duryea, Elwood Haynes, Colonel George Pope, Lewis Clark and George H. Brown, who were the guests of honor of the local tradesmen, could make of it the success that was forecast. In fact, some of the chief "Boosters" became "knockers" whenever the subject was mentioned.

Strictly speaking, the affair was decidedly frosty. The "entertainment contractor" had on hand all the properties, including the "actors," for a typical Bowery "amateur night." The Bowery flavor was not as well disguised as it might have been, however, and, as a result, the characters became targets for more than verbal slings.

Nor was the food any better than the cabaret. Tickets were $5 apiece, and there were aprons and caps in abundance, but the beefsteak was too small and so scarce as to suggest that the caterer had looked out for himself. There was beer to go with what little beefsteak there was, of course, and there were cocktails distributed in Monogram oil bottle, though not everyone knew what they were, and suspecting the kind of trickery that sometimes is disguised as practical joking, looked at them askance and left them. Also there were Haynes cigars that were not disguised, and consequently were smoked, and a number of accessory dealers provided a variety of souvenirs.

Among the other social functions of the season, the Goodyear Tire & Rubber Co. held a "show" dinner at the Astor on Tuesday night, and to-night (Thursday) the Stutz Motor Car Co. is to hold a dinner at the Waldorf. On Friday night the American-Marion Sales Co. will banquet its followers at George Rector's.

Mott to Manufacture Wire Wheels.

The Mott Wheel Works of Utica, N. Y., which heretofore has confined its operations to the production of wood wheels and rims, has entered the wire wheel trade with a radially laced product. The detaching mechanism is simple in the extreme and comprises a latch which is released by the simple pressing of a push button placed in the center of the hub. Even simpler is the replacement operation, for the wheel is simply slipped in place where it locks automatically.

A. A. A. MAY REVIVE TRUCK RELIABILITY CONTEST

Also Takes Steps to Resuscitate Tour for Glidden Trophy—Seven Clubs Admitted and Hopper Is "Watched."

Calling up visions of the Chicago-promoted and abandoned commercial vehicle contest mooted about this time last year and having either New York or Chicago as a terminus, the subject of a National reliability run for commercial vehicles again has been broached, and this time it is in a fair way to receive a great deal more consideration than it ever received before. The subject was one of many, and probably the most important of any, that engaged the attention of members of the American Automobile Association in annual session foregathered at the Hotel Belmont in New York City on Monday, 13th inst. In the absence of President Laurens Enos and First Vice-President J. A. Wilson, Second Vice-President Dr. H. M. Howe, of Maryland, presided.

Although the desirability of a national reliability contest for commercial vehicles was discussed at considerable length, practically no decision was reached, the only action taken being the formal adoption of a resolution empowering the president to appoint a committee to inquire into the proposal. The resolution is as follows:

"Whereas, The great increase in the use of commercial motor vehicles during the past year has been such as to raise the question of the need of a national motor truck reliability tour; therefore be it

"Resolved, That the president is hereby authorized to consult with the N. A. A. M. as to the value of such an event, and if a sufficient support in the form of a representative entry list is forthcoming the president is further empowered to appoint a committee and otherwise arrange for such an event during the coming summer."

The president also was empowered to arrange for the almost annual national reliability tour for the A. A. A., Glidden and Anderson trophies, which suggests that the fiasco of this year has not wholly disheartened the A. A. A.

Subsequent to the transaction of the routine business of the meeting, which included the addition of seven clubs to the list of members—two each from Iowa, Kansas and Oregon and one from Montana—bringing the total membership list up to 457, and the installation of N. H. Van Siclen of Illinois as a member of the Executive Board, ex-President Robert P. Hooper was presented with a gold watch and a special A. A. A. fob in recognition of his services.

An invitation extended by President Powell Evans of the Automobile Club of Philadelphia, asking that the A. A. A. hold its semi-annual meeting in the recently finished new headqaurters of the Philadelphia club, was unanimously accepted; dates will be decided upon at the next meeting of the Executive Board.

More Activity of Weed Interests.

Another one of those moves which recently have been a part of activity in the Weed chain interests was made this week when the chain business of the Cleveland Wire Goods Co., of Cleveland, O., was taken over by the American Chain Co., the recently formed corporation which is identified with the Weed Chain Tire Grip Co. The transfer was made because of the necessity that the American Chain Co. acquire additional factory space for the manufacture of side chains. This part of the Weed chain has constituted about 50 per cent. of the Cleveland company's business for some time, and although the fact has not been advertised widely, the latter concern has been closely allied with the Weed industries.

To Triple Hydraulic Steel's Capital.

Preliminary steps have been taken by the Hydraulic Pressed Steel Co. of Cleveland, O., maker of automobile frames, among other things, to increase its capital stock from $400,000 to $1,200,000, of which $1,000,000 is to be represented by common and $200,000 by 7 per cent. preferred shares. When the increase is authorized by the stockholders, it is the intention to declare a stock dividend of 100 per cent.

New York Office for Champion Plugs.

Better to care for its Eastern trade, the Champion Spark Plug Co. of Toledo, O., has opened a New York office in the United States Rubber Building at 1790 Broadway. It will be in charge of F. B. Caswell, sales manager of the company, who will divide his time between Toledo and New York.

Receiver Sets Date for Penn's Auction.

The assets of the Penn Motor Car Co. of New Castle, Pa., will be offered for sale by the receiver on Tuesday, January 21st. The property includes real estate, a concrete factory building, machinery and a considerable quantity of automobile parts.

Mills Sails on Globe-Girdling Jaunt.

David B. Mills, president of the Rajah Auto-Supply Co., of Bloomfield, N. J., and Mrs. Mills, who have been spending some time in California, sailed on Monday, 6th inst., for a trip around the world. They will return about June 1st next.

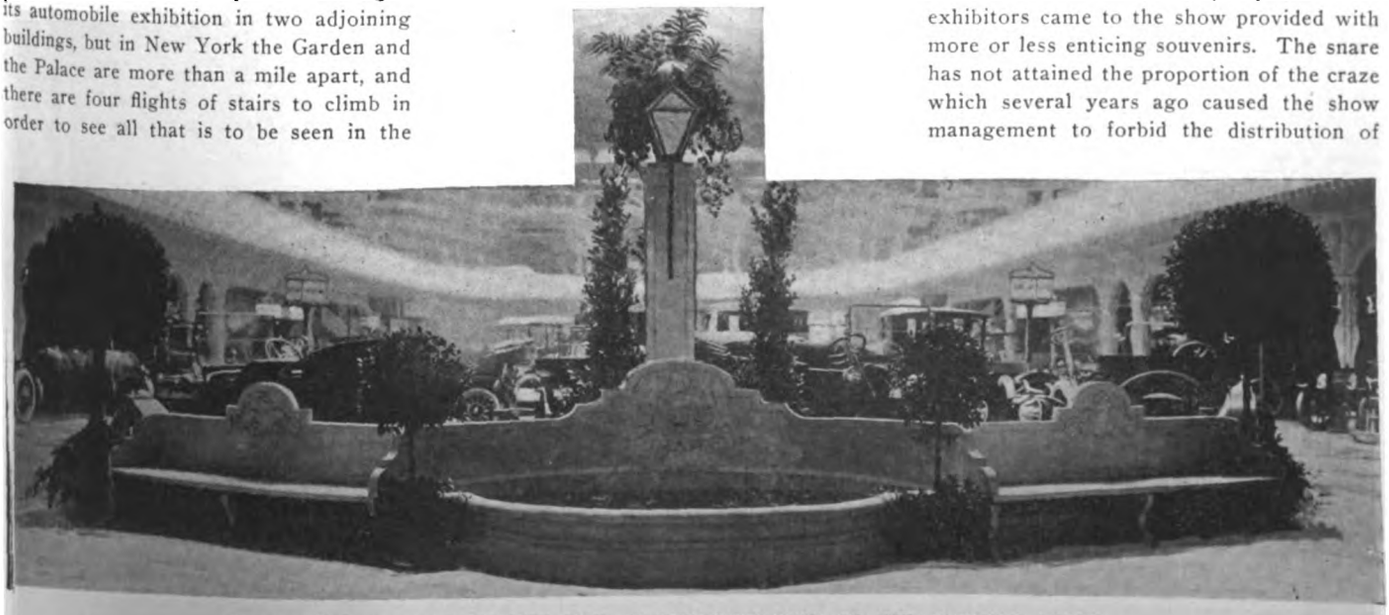
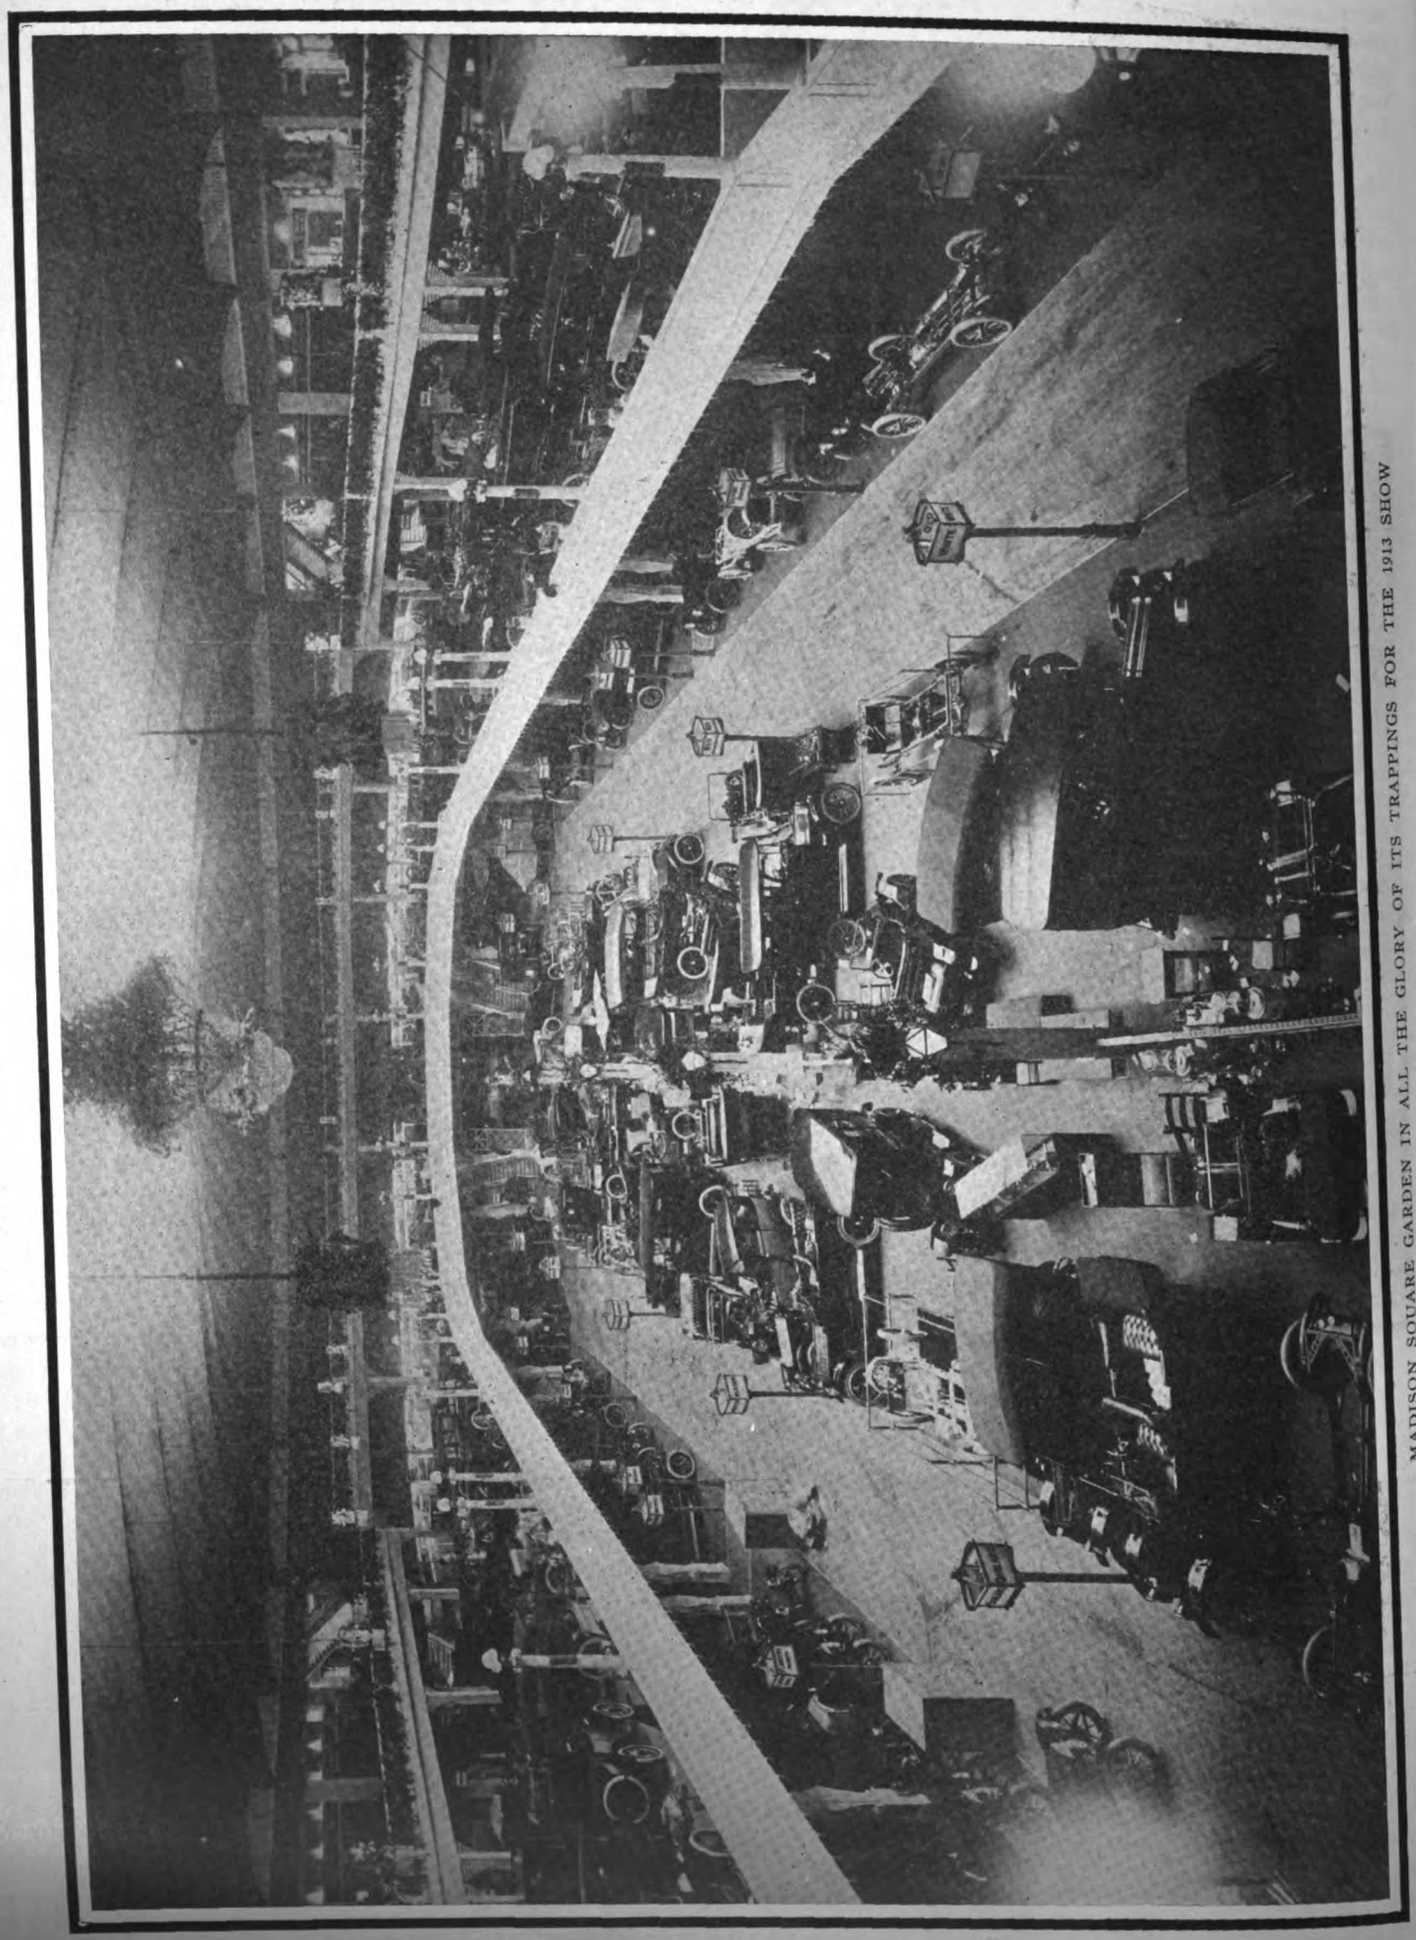
NEW YORK SHOW BEARS OUT ITS PROMISE



Emphasizes That This Is "The Year of Greater Values," as Indicated by Motor World—Also There Is More Show for the Money Than Ever Before—Twin Exhibition, in Handsome Dress, Bristles with Evidence of Trade Progress—Painstaking Search Discloses Surprising Novelty in Both Cars and Accessories.

One show in two buildings for even half of two weeks is just about as much of automobile shows as any reasonable being is likely to want within the course of a twelvemonth, at least, such shows as now are being housed in Madison Square Garden and Grand Central Palace in New York. No one who pays the admission fee can claim that he does not get more than his money's worth.

It is "a year of greater value" not only in respect to the cars themselves but from the standpoint of the mere show-goer as well. In other years there have been rival shows in progress in the same buildings at the same time, but never before under the same auspices and seeable for a single admission fee. Chicago for several years has staged its automobile exhibition in two adjoining buildings, but in New York the Garden and the Palace are more than a mile apart, and there are four flights of stairs to climb in order to see all that is to be seen in the Garden and three upward flights in the Palace. Chicago has but one flight to ascend, and while its display usually exceeds New York in point of car exhibits, for some inexplicable reason the display of accessories, while imposing, is thrown into the shadow by the truly formidable array outspread in New York.



Most of the dealers and other tradespeople who visit shows consider the accessories worth seeing, but the average show-goer, who is overwhelmingly in the majority, rarely looks beyond the car. Not more than 50 per cent. of the attendance at the New York show descends to the basement or climbs more than two flights of the stairs, and—take it from those who have tried it—making the rounds of two immense buildings, a mile apart, and climbing seven flights of stairs while doing so does not constitute a round of wholly unmixed pleasure, at any rate, not if it is attempted within the span of a single evening. The New York show-goer of 1913 who tries it obtains all that his admission ticket entitles him to and cannot fail to return to his home a much-wearied individual.

If anything, the "climb to the skies" has been more popular this year than for several seasons past, and the reason is not far to seek. The snare of the souvenir has lured upwards many who otherwise would have been content to remain on the lower strata; for, strangely enough, and as if through the medium of telepathy, not a few exhibitors came to the show provided with more or less enticing souvenirs. The snare has not attained the proportion of the craze which several years ago caused the show management to forbid the distribution of

advertising gewgaws, but they are sufficiently numerous as to be distinctly observable, and the small boy, and the boy who is not so small, to say nothing of womankind, have not been slow to follow the scent.

Without well-defined meaning, it is customary to refer to such things as "brave shows," and, whatever it means, it may be said that the twin display in New York is as brave as any show that ever held the boards. There is more of it, and in either building it is handsome to look upon. As always, the immense arena, with its overhanging balconies, permits of Madison Square Garden being "dressed" as few other buildings can be "dressed"; it permits of a picture which fills the whole eye. In the Palace, half a dozen eyes are necessary, for that magnificent structure is so laid out that not all of it can be seen at a glance.

The decorators, or whoever is responsible for that sort of thing, dubbed the Garden a Crystal Palace, but if the truth be told it requires a stretch of the imagination to distinguish anything of the sort. Rather does it appear a great white show. From the more or less fleecy sky there depends three magnificent crystal chandeliers, overflowing with crimson flowers and other plants, which are flanked on either side by a series of much smaller chandeliers of the same crystal effect, and there is a wide expanse of mirror set into the walls on either side of the main floor; but the mirrors are thrown into a shadow by the wide overhanging gallery and the cars themselves half hide them. As a result, the crystal effect and the spaciousness which it was assumed the mirrors would lend to the Garden are not nearly so pronounced as fancy had pictured. For all of that the Garden does seem more spacious, but it comes not of the mirrors but of the little-remarked fact that one of the elevated platforms of previous years has been dispensed with.

LOOKING FROM THE LOBBY OF MADISON SQUARE GARDEN INTO THE ARENA

The fountain, without which no Garden show would be complete, as usual greets the show-goer immediately he sets foot inside the arena. It is rather a modest fountain, compared with the fountains of yesteryears; it lacks the over-topping statuary which hitherto has been the rule, but the water is real, and so are the water lilies which float on its surface.

The center of the arena is bisected by a low, white fence, from which at stated intervals are upreared white columns capped by trailing greenery and crimson flowers, and from which are suspended on either side amber colored lamps. They are at once simple and eye-pleasing and, as does the green carpetry and the green sign posts bearing each exhibitor's name, they serve to relieve the general whiteness of the decorative scheme.

In the sides of the building, which are overhung by the elevated platform, huge mirrors have been set in a background of green, the elevated platform itself being upheld by allegorical female figures which form a partial arch over each exhibit and the severity of which is relieved by a touch of white lattice work. The elevated platform has a false front of white slightly relieved by a pink tint and is illuminated by columns topped by three white globes. The rail of the upper balcony is beautified by weavings of crimson ramblers, but the signs and the background of the galleries are reminiscent of other years; the same green and red wall paper being utilized to conceal the bare walls. That form and color of wall covering, with bunting employed to cover the roof, also is made use of in that beehive of noise and industry located in the basement.

Grand Central Palace, as so often has been remarked on previous occasions, does not readily lend itself to the decorative hand and, employing an almost equally stereotyped observation, its magnificence is such that it scarcely requires embellishment, but for all of that the present show indicates that even painting the lily can be successfully performed, for imposing though

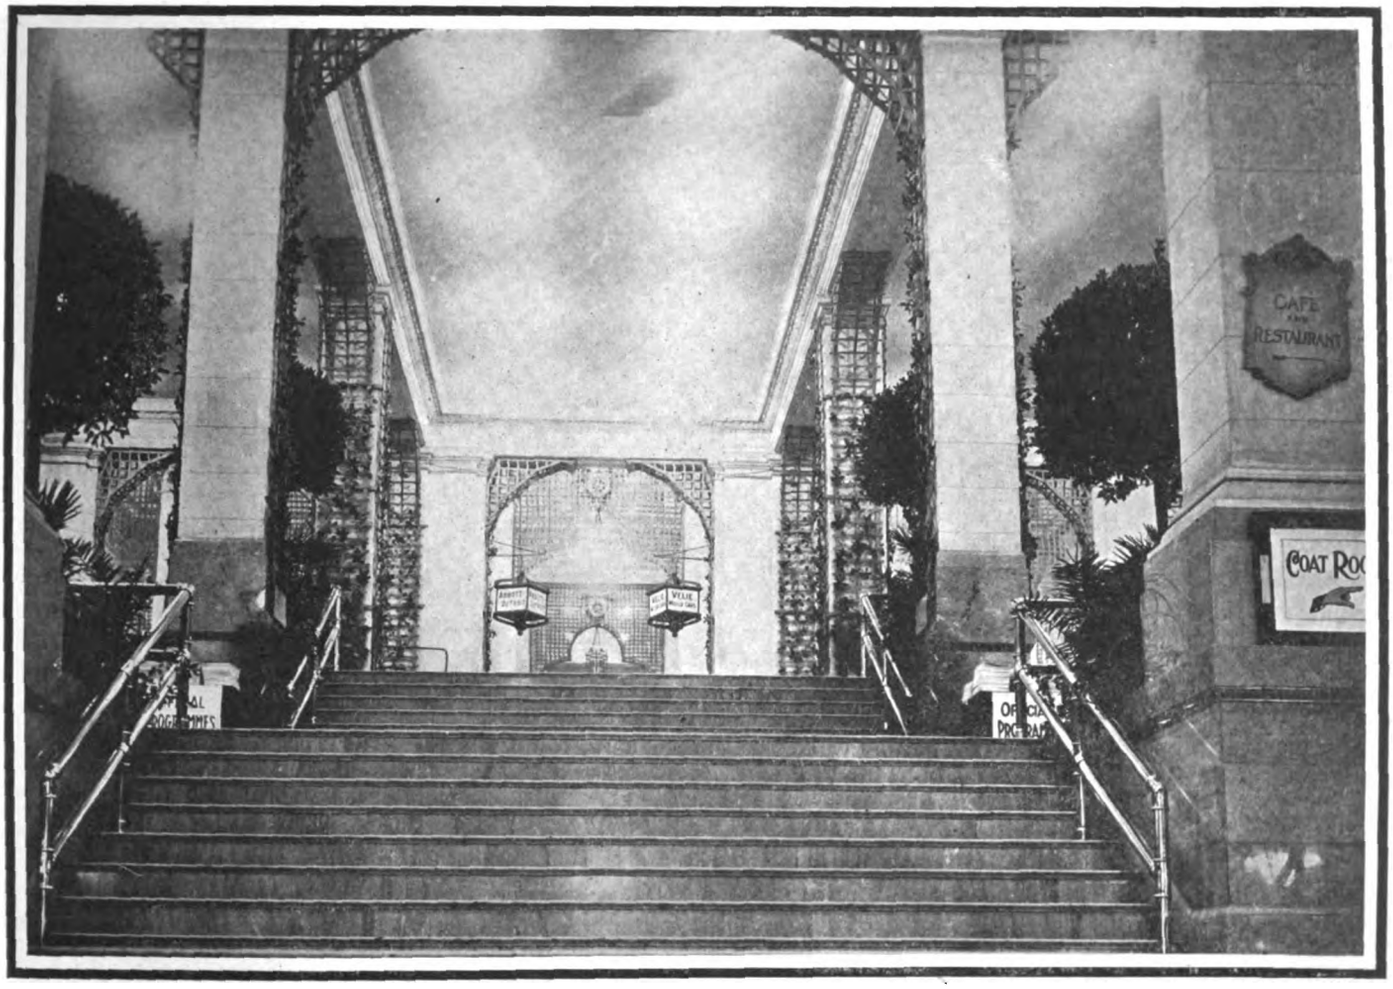
GENERAL VIEW OF CENTRAL COURT IN GRAND CENTRAL PALACE WHICH AFFORDS GOOD IDEA OF DECORATIVE SCHEME

Digitized by Google



it may be in unadorned grandeur, the Palace, with its great marble columns, has been rendered a far more pleasing picture. Green trellis work has been deftly arranged at the base of the great marble columns and between them, also on the smaller uprights, in the corners and on the walls, a glow of warmth being given to the whole by flaming red poinsettas interwoven in the trellis work, while in the wide panellings of the naked walls have been arranged landscapes and waterscapes which simply compel admiration. In other years, trellis work and wall paintings were laid with stinted hand, but on the present occasion there was no stint, and the result is charming to all who have eyes to see it. The walls of each floor are hung with a succession of painted reproductions of many of America's beauty spots, in the East, in the West and in the Southland. Viewed from a distance, and with imagination awake, it appears almost as if one is looking out from the Palace on the Palisades of the Hudson, the rugged heights of the Rockies, the plains of the West or moss-grown vistas in the sunny South. Most of the pictures were painted from photographs, and in the majority of them the motor car lends a touch of life.

At the very end of the main aisle of the main floor of the Palace is an old friend that bears witness that the Automobile Board of Trade had to do with the decoration of both buildings. It is the white statue typifying the "Spirit of the Motor Era," or the "Infant Industry," which last year overlooked the fountain in Madison Square Garden—the statue of a chubby youngster holding a loft a motor car while standing astride a motor truck which rests on an anvil. He is now doing duty at what preliminary notices described as a Roman exedra, which word sent more than a few men to the dictionary only to discover that exedra is another word for "a dignified seat." In other words, the statue now looks down on a slightly ornamental bench.

After a fashion, Grand Central Palace may be termed, for the nonce, a Palace of Popular-Priced Cars, for most of the cars that come within the purse of the man of moderate means are staged there. On the other hand, most of the cars of higher price, and perhaps of greater size and power, are located in the Garden. There are exceptions in both instances, of course, but the general fact remains; and the term "popular priced cars" has been given new meaning by such sumptuous vehicles as the Studebaker "six" limousine at $2,500 or the Sedan at $2,050; they really must be seen to be appreciated. And with a Reo limousine at the almost incredible price of $1,600, a Paige-Detroit sedan seating four persons, at the same price, and Bergdoll limousines at $2,400 and $2,600, even the jaded well may ask, "What next?"

Despite a cold rain which fell Saturday night, when the doors were thrown open, both buildings soon were filled. The greater crowd was in the Garden, perhaps, or it may be that it merely seemed that the greater crowd was there because of the usual congestion on the main floor and elevated platforms, while in the Palace crowds are spread over a greater space and are not so easily observable at one glance.

However, the shows have lost none of their attractiveness from the public standpoint, and crowded houses have been the rule. While the crowds are wiser than the crowds of earlier years, those persons who, if wishes were motor cars, would become possessed of them remains in the majority.

NEAR TOP OF GRAND STAIRWAY IN GRAND CENTRAL PALACE AND A SUGGESTION OF EXHIBITS AND DECORATIONS BEYOND

Digitized by Google

There is so much that is purely mechanical that what they see to interest them remains an open question.

There are fewer highly polished or special "show" chassis than heretofore and fewer purely "show" cars, but, as always, there are a few of them that have been designed for the occasion and perhaps they best serve to fill the average eye.

Luxury in Special "Show" Cars.

By all odds, the showiest car on exhibition is a Locomobile limousine, the body of which is finished in two quiet tones of red and the interior upholstered in crimson tufted silk; the lamps within and without are of ornate design and finished in gold, as are all other metal trimmings. Usually reds are garish, but these Locomobile reds are so refined and richly blended that they radiate warmth rather than garishness.

A Peerless brougham of special design and equipment is another imposing creation. It follows the lines of the traveling carriage of a Colonial grandee of 200 years ago. Outwardly it is finished in yellow and black, while within it is upholstered in brown leather of velvet finish and is lighted by several dome lights of cut amber glass, so that even the prevailing illumination is of a subdued brown tone. Flower vases and carpetry are of the same amber hue. All of the interior fittings are gold plated, even to a clock which is provided with a tiny electric light and to the cigar lighter. Under the arm-rests which divide the rear seat is a cellarette, and there is also a table which may be swung into place on which to serve refreshments or to use as a reading table. Not so beautiful but almost as striking is another Peerless closed car, a limousine, with a gray metal body and with almost square lines which in these days appear uncommonly severe.

"Cabette" and Cabriolet Revealed.

What is styled a "cabette" but what really is a two-passenger brougham, constitutes the centerpiece of the Packard exhibit. It is striking chiefly because of its long "forefront" and small body, but in its lamps a clever conceit has been introduced for show purposes. The lenses of both headlights are of ground glass on which has been photographed in colors a Packard car in a landscape setting. As the electric lights are turned on at all times, the pictures stand out almost as if projected by small magic lanterns.

Of the several "show" cars, the one that screams loudest is the Premier cabriolet, styled the "Killarney Colleen." It is finished in what is termed Monihan green, which is of a brilliancy which cannot fail to suggest the "old sod." The green is relieved only by a painted belt of fire-alarm red and red rimmed wire wheels. The upholstery is done in imported English pigskin with bird's-eye maple trimmings; there also are silk plush carpetry and French golden curtains. The storage capacity of the car is also one of its features. Compartments are provided in no less than three different places.

In touring cars the only showiness is the result of Briggs-Detroiter effort. The car is finished in white with a gold belting and all of the fittings are gold plated. If it were not a regular model, the lines of the Pathfinder "cruiser" model would almost cause it to be singled out as a "show" car and the same is true of the little Hupmobile coupe with its almost circular body and odd looking "pancake" ventilator, and which suggests the individual equipage of a Far Eastern potentate. In its class, the Cole speedster has the most striking and most original body design in evidence. With its three seats abreast, and divided rear deck, it presents an odd appearance not easily described.

"Action" Exhibits That Attract.

While the general use of electric starters has made it possible for almost every exhibitor to give at least temporary demonstrations of cars in "action," "action exhibits" are fewer than for several years, at least so far as cars are concerned. "Up aloft" or "down below" in the realm of accessories, makers of ignition apparatus, and bumpers, and shock-absorbers, and the producers of oil are able to demonstrate the "action" of their various devices. But com-

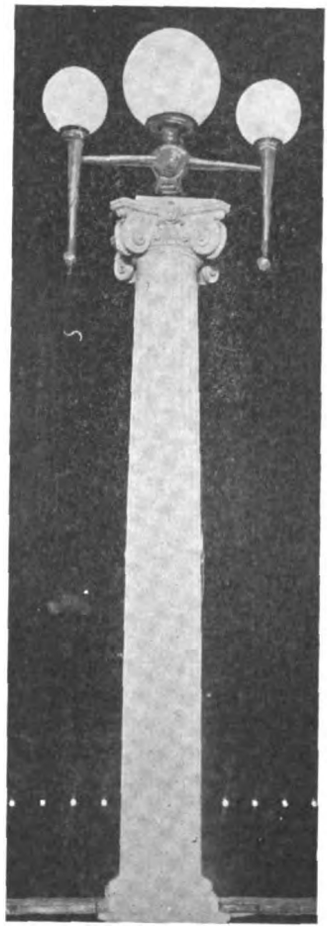
paratively few car makers are doing anything of the sort. At least three of them, however, are employing "action" to good advantage—Speedwell, with a cut-away engine which, illuminated from within, graphically shows the operation of the Mead rotary valve; the Cartercar, which shows its "gearless transmission" in operation, and the air-cooled Franklin, which employs a number of pinwheels which simply but effectually illustrate the direction of air currents.

It is in the basement, however, that the oddest and most picturesque "action" ever brought into an automobile show is to be seen. W. B. Laidlaw, Jr., is the man to whom the credit is due. He is utilizing live ducks and live fish to exploit the merits of the top material which he has for sale. He has filled two sections of it with water and the ducks and fishes are disporting in the improvised "ponds" which thus vividly prove the waterproofness of the Laidlaw material.

"Fine Points" Revealed by a Critical Study of the Cars Displayed

The mechanical aspect of the show, too, already has been told in Motor World's 400-page Before Shows Issue with a thoroughness and a minuteness never before attempted, and as a result, the show in the abstract, or the concrete, or anything else, is a little more than a vindication of the trends and tendencies and developments laid down in that issue; it is an emphasis of them that serves to bring into bolder relief the differences in detail that make for individuality without disturbing the structure that is built of common practice. Having perused Motor World's Before-Shows Issue, inspection of changes and improvements and those comparisons and "studies" are facilitated as never before.



Landaulet Bodies Among the Missing.

Of course, there are surprises; it was known that there would be "something sprung" in a number of instances, though not all the "surprises" materialized. And equally as a matter of course, there is much to attract those who hanker after something "just a little different"—and much of it is surprising in more than one respect.

In all the show, there are no landaulet bodies, which is so surprising as to be remarkable in view of the general increase in the popularity of closed cars of other types and the seeming favor with which the landaulet was viewed at the last show. That there are no steamers is not so surprising, for the steam car steadily has coasted down the hill that has popularity for its summit until at present it is so near to the bottom that it almost is out of sight. Similarly, there are no "one-lungers" and no "two-lungers," to carry the simile a little further, nor is the two cycle engine represented by a single adherent to that supposedly simple principle; it has just naturally flickered out almost unnoticed.

Franklin the Only Air-Cooled Car.

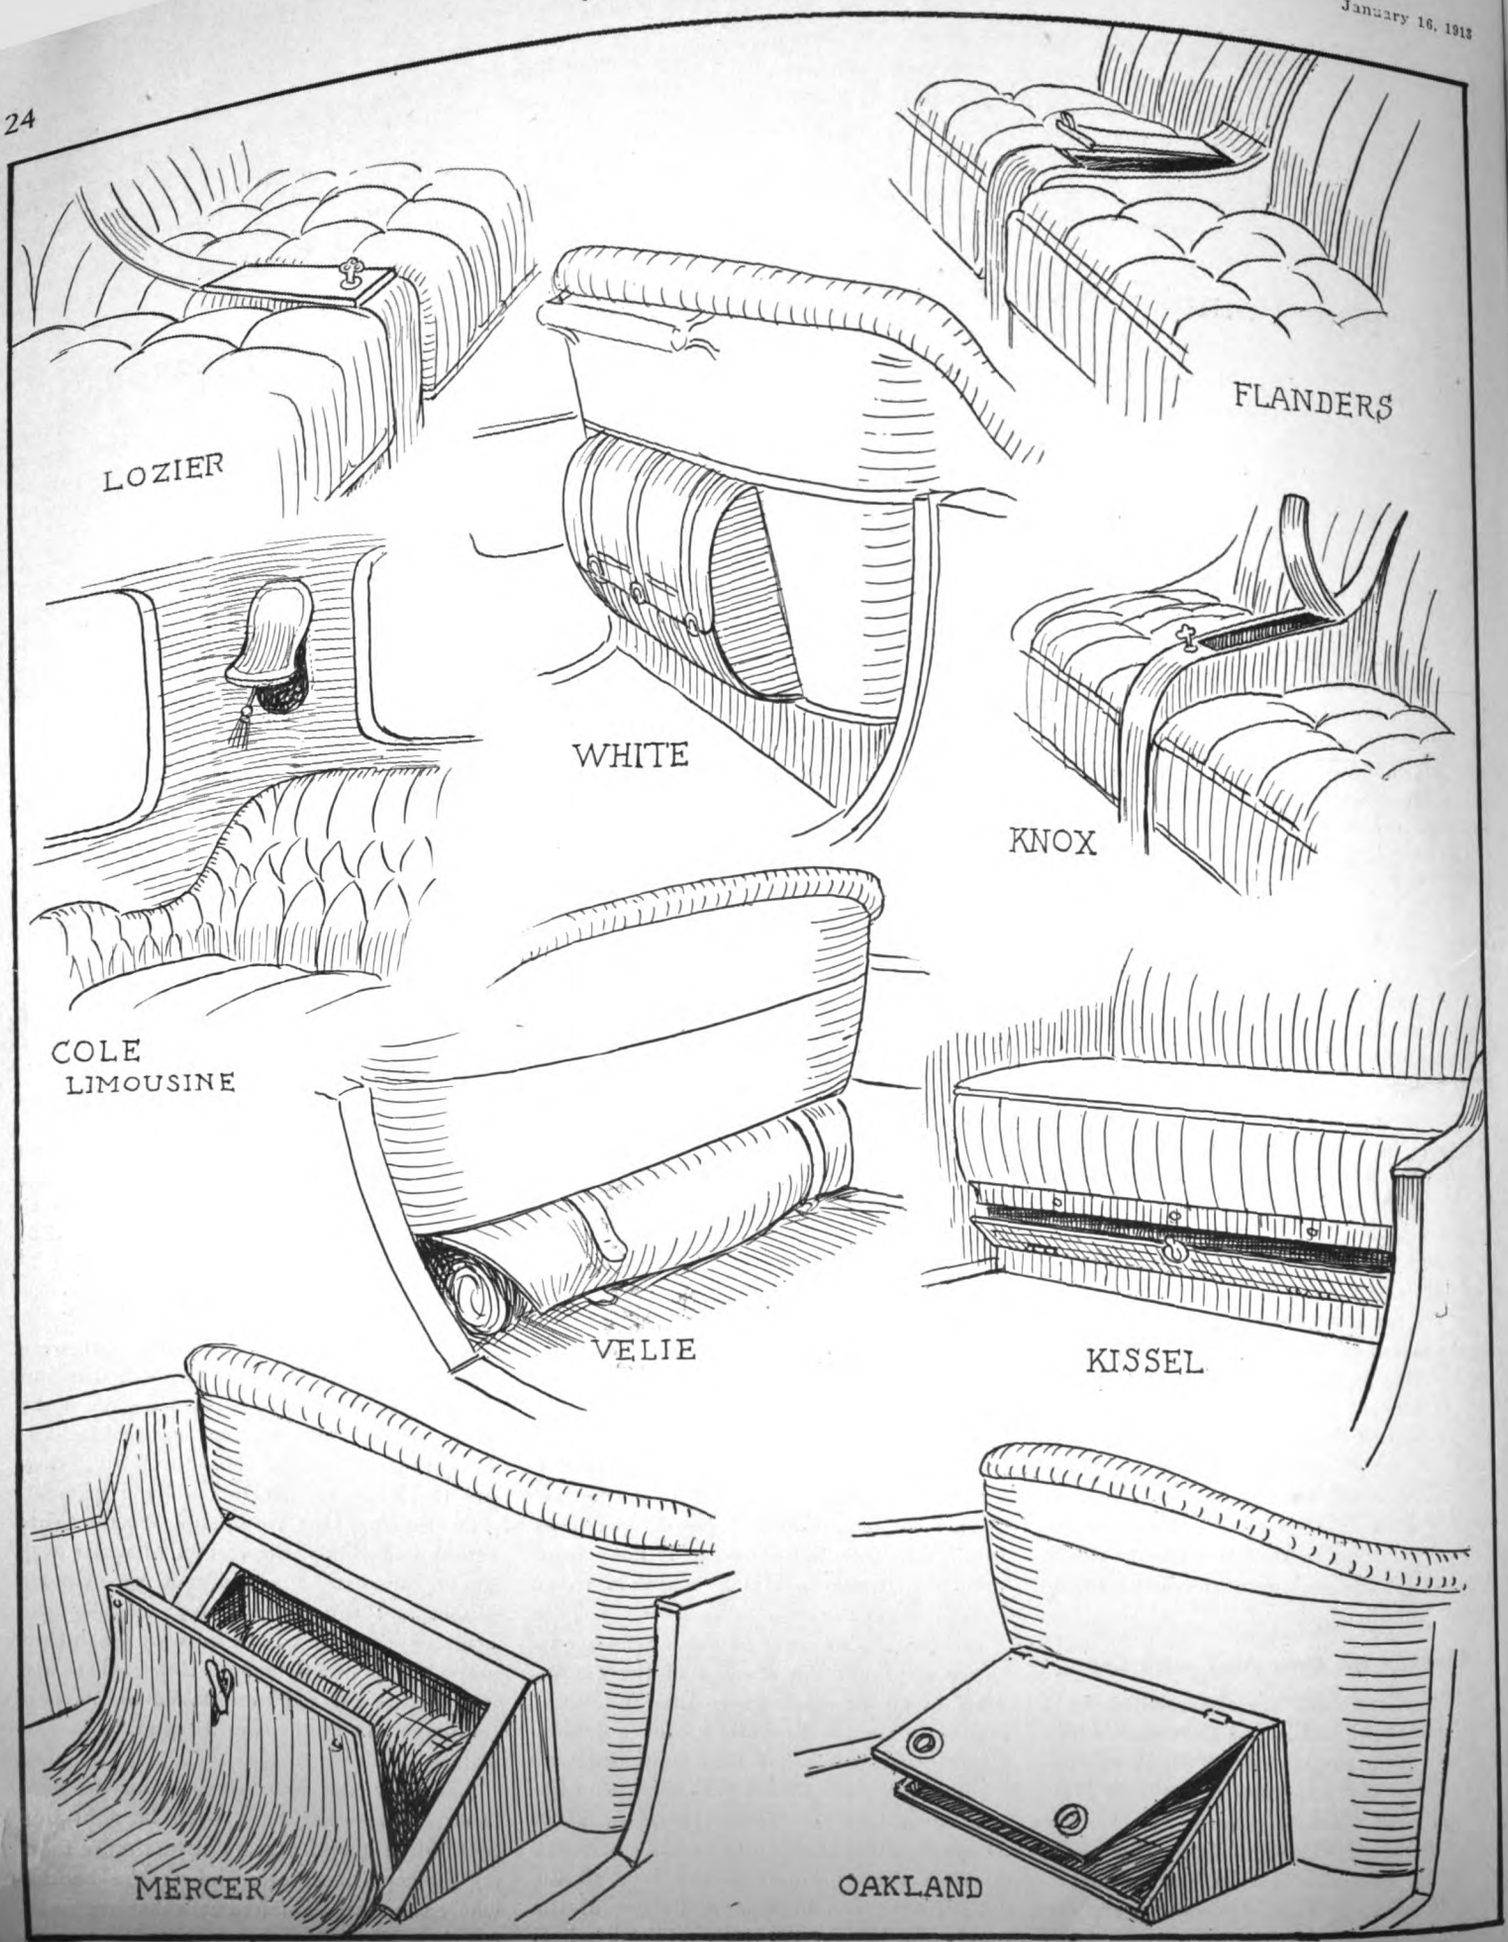
Chain driven cars are represented by a single exponent, unless the Cartercar, which is driven by a single "silent" chain, is considered, and that exponent is the little Metz roadster—the lowest priced car in the show. Strangely enough, both the Metz, which, as everyone knows, or ought to know, is driven by twin side chains, and the Cartercar are of the friction driven type, and these two cars are the only ones of their kind at the show. The only other place place where it is possible to speak generally

and use the word "only" is in reference to air-cooled cars. There is only one air-cooled car on the floors, and no one needs to be told that that one car is none other than the Franklin, which has held to air cooling from the first.

Incidentally, if there be those who are inclined to doubt the efficacy of the cooling draft of air to reach every little nook and cranny of the big Franklin motor, a demonstrating car which has been equipped with a celluloid paneled hood will serve as a liberal education. Altogether there are 25 or 30 small aluminum "pin-wheels" balanced all over the engine from the tops of the cylinders to the lowermost depths of the hood, and the way they spin as the flywheel of the engine is rotated under the persuasion of an electric motor leaves little room for doubt regarding the direction, or, rather, the many directions of the currents of cooling air.

Two Real Surprises Are Sprung.

Two of the few real surprises of the show that were kept so carefully muffled that not even an inkling of the imminence of their birth was permitted to escape are to be found at the Haynes booth, where there is a brand new "six" that was suspected by remarkably few, though the rest scarcely would have difficulty in recognizing it as a Haynes once they could glimpse its features and at the American stand, where, too, there is a new "six."



Externally, the Haynes is a roomy car finished in gray with nickel-plated trimmings and upholstered in finely striped gray whip cord. McCue wire wheels lend an added air of distinction, though they are far from exclusive with the Haynes. It is styled model 23 and, in common with the new four-cylinder Haynes, which also is making its inital appearance, it has an L-head motor with the cylinders cast in pairs and measuring 4¼ x 5½ inches. Both of them are electrically lighted and started and both sell for moderate prices—the "six" at $2,500 and the "four" at $1,785.

New Cars That Make Their Debut.

Of all the 88 brands of cars that were scheduled to appear, only two failed to put in an appearance, and as ever has been the case, several unlisted and unheralded exhibitors are "among those present"; they are the King, the Keeton and the Schacht. The two lines that are missing are the Warren and the Only, the former of which was due to uncover a brand new six-cylinder model and the latter a four-cylinder car utilizing a motor with a bore of 4¼ inches and a stroke of 7⅞ inches. Hence, there are 89 separate car exhibits staged in the two buildings—43 in the Garden and 46 in the Palace.

Naturally, the new "sixes"—and the new "fours," too—that have been brought out by old-line manufacturers attract more than do their predecessors, and at the booths where there are exhibited cars that are making their initial appearance there is a never-

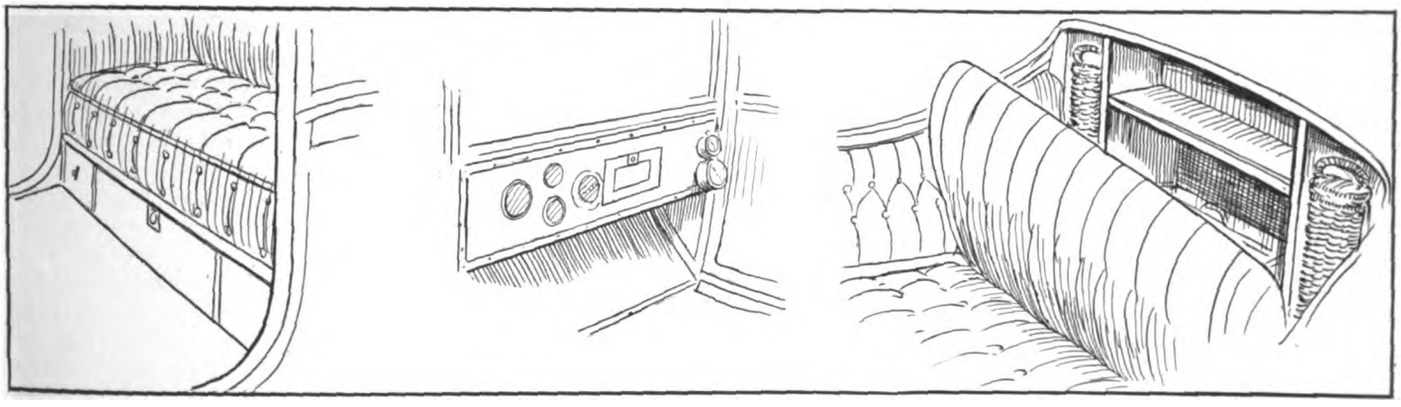
Digitized by Google

THE PROBLEM OF FINDING STORAGE SPACE IN TOURING CARS—NINE SOLUTIONS OF IT

Digitized by Google

ending stream of spectators to pay homage and inspect and criticize. Particularly are the new low-priced "sixes" the center of attention—the Little, Krit, Studebaker, Flanders, Herreshoff, Mitchell and Havers—and those that mount slightly higher up the price scale and list between $2,000 and $3,000 scarcely are less patronized; the list includes Chevrolet, Havers, Stutz, Oakland, Hudson, Cole, Mitchell, Imperial, Premier, Inter-State, Lenox, Garford and the two Speedwells, the Speedwell-Mead and the Speedwell poppet valve. Among the higher-priced "sixes" that are new there is the Norwalk, which is not now the only underslung "six," the Oldsmobile, Lozier, Packard, Knox, Stevens-Duryea, Stearns-Knight, and Marmon. All in all, there are no less than 31 brand new "sixes" in the list.

Apart from the fact that the motor of the American six-cylinder car has six cylinders, that the stroke is 6 inches and that the body is very slightly shortened up because of the longer motor hood, there is nothing in it that is not familiar in American underslung construction. The motor is of the T-head type, with a bore of 4½ inches, and is rated at 60 horsepower. The chassis is practically that of the "traveller," with a wheelbase of 140 inches and 39 x 5 inch tires front and rear on demountable rims, and carries a six-passenger touring body. A double unit electric starting and lighting system is included in regular equipment.



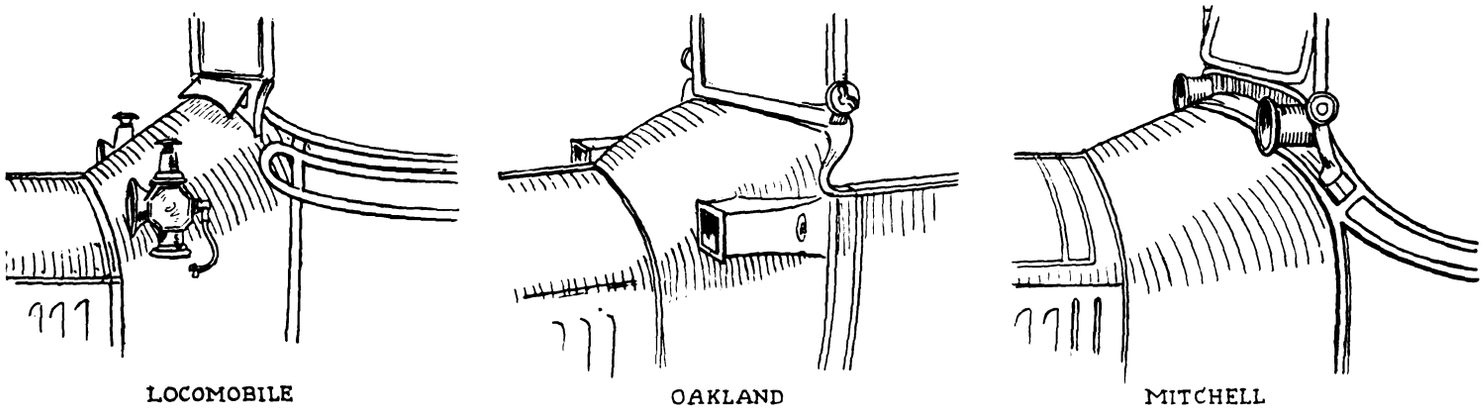
Among the new "fours" that make their first appearance there are six that sell for less than $1,000, the little Metz roadster being at the head, or the foot, of the list, as the case may be, with a selling price of $395, and the others, including the Little, Detroiter, Studebaker, another model Detroiter, and Empire, mounting each slightly higher in the price scale up to $950, which is the price of the Empire. Among the higher-priced "fours" that are new, the list is no less impressive and includes the Oakland, Maxwell, Paige-Detroit, Studebaker, Henderson and Mitchell, selling for between $1,000 and $1,500; the Michigan, Abbott-Detroit, Haynes and Bergdoll selling for between $1,500 and $2,000; and the Pope-Hartford, Edwards-Knight and the Fiat, selling for more than $2,000.

Considering all the new cars, none is a real surprise except the Haynes, of course, the American, and possibly the Krit "six," though even that car was forecast in Motor World's Before-Shows Issue. At that time, however, details of construction and price had not been definitely decided by the manufacturers. Actual inspection of the car reveals a little more car than might have been expected, judging merely by the estimated price, which, it is understood, is to be in the neighborhood of $1,300.

It is a big, roomy, five-passenger car with a 50-horsepower motor that is chiefly distinctive by reason of the fact that the cylinders are cast with the complete crankcase integral, the cylinder heads being detachable and in two sections, each section covering three cylinders. The bore and stroke are 3¼ and 5 inches, respectively. The engine is a unit with the multiple disk clutch and the three-speed gearset and supported at three points in the chassis frame; wheels are shod with 34 x 4 tires and the wheelbase is 120 inches. By way of providing for the accommodation of almost any size driver, the steering column is easily adjustable up and down and the pedals may be lengthened or shortened at the will of the driver. The steering wheel is placed at the left side with the control levers in the center.

The only other new car that might be considered somewhat in the light of a surprise is the "35-4" Maxwell, which is shown side by side with the Flanders cars and is so much like them that it requires the word of a salesman to distinguish between them. It has a four-cylinder motor, of course, and differs from the Flanders "sixes" (which soon are to be called Maxwell, too) in that respect. It sells completely equipped for $1,085, though there is nothing in its make-up to suggest the lowness of its price. Its motor, for instance, is of the same general type as the Flanders motors, with cylinders cast in a single block; dimensions are 4 x 4¼ and the transmission elements include cone clutch and three-speed selectively operated gearset located on the rear axle.

The roster of the older cars that are exhibited is very nearly complete, as may be judged by reference to the accompanying summary, which lists all the makes represented. With but very few exceptions, the names of the cars that have gone to make up the shows of the past are to be found on the signs that direct visitors in either the Garden or the Palace, with here and there a newcomer that adds spice to the list. The Edwards-Knight is one of these, and the Stearns-Knight "six" is another; the former already has been illustrated and fully described in a previous issue of Motor World, to say nothing of a resume of its principal features which appeared in the Before-Shows Issue; the Stearns-Knight also was reviewed in the Before-Shows Issue. For the delectation of those who would have word of mouth with the inventor of the Knight engine, no less a personage than Charles Y. Knight himself discourses daily on his engine at the space where the cars with the "white line on the radiator" are shown.



DIVERSITY OF STORAGE SPACE PROVIDED IN THE PREMIER "KILLARNEY COLLEEN" CABRIOLET

With the exception of the Knight engines, there is only one other type of non-poppet valve engine regularly fitted to a car at the show. The engine is the Mead, and though it, too, has been reviewed in the Before-Shows Issue of Motor World, there are many "fine points" in its construction which will be of benefit for closer inspection, a fact which is equally true of nearly all the other cars, new and old.

Though the Speedwell Mead engine conforms closely to the general design of the Mead motor which made its appearance for the first time at the summer convention of the S. A. E. two years ago, some changes have been made, as might have been expected, in building a "six"; the original

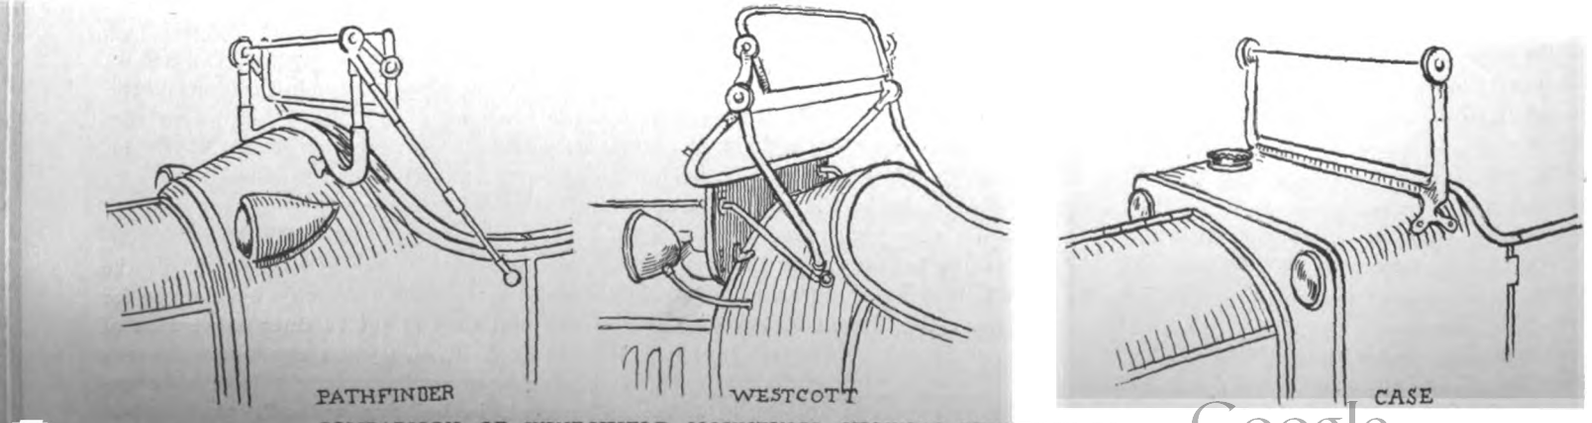
LOCOMOBILE OAKLAND MITCHELL

CONTRASTS IN SKUTTLES, SHOWING THREE METHODS OF MOUNTING LAMPS

motor was a "four." The valves, which constitute the principal feature of the motor, are long and cylindrical and are mounted in pockets which run the length of the cylinder casting near the top of the combustion chambers; they are slotted and register with ports in the cylinder walls, thus permitting the same functioning as do the poppet valves in a poppet valve motor. There are two of these cylindrical members, one serving for the intake and the other for the exhaust, or, to be more explicit, there are four in the six-cylinder Speedwell engine, it having been found advantageous to make each member in two parts and to join them with a coupling of the Oldham type in order to permit a flexible drive without back-lash or looseness. The unit type of construction is employed, and this, together with the outward form permitted by the peculiar valve system, results in an exceedingly clean, neat looking engine.

Methods of Mounting Starting Motors.

Speaking of unit construction, there is a neat example of the inclusion of a starting motor with a unit power plant in one of the chassis at the Palace—that of the Herreshoff—and the most conspicuous feature is the way in which the gearcase has been carried up to join the starter casing, which is superposed on the housing of the flywheel. The whole arrangement has the appearance of "belonging" together, which, in fact, it does, as the design was worked out for the purpose. The more usual method of mounting the starter motor is on a special bracket on the crankcase, as is done in the Abbott-Detroit, in which motor, however, the starter drive is unusual in that it employs a set of gears all its own, though housed with the timing gears. By virtue of a ball-ratchet clutch arrangement, the extra gears are always idle, except when the motor is actually being started; and they do not move even when the motor is cranked by hand. The ball-ratchet is automatic in taking hold when the starting motor is switched on, so that no sliding gear or other engaging device is required.



SPEEDWELL GARFORD

STORAGE PROVIDED BY COWLBOARDS

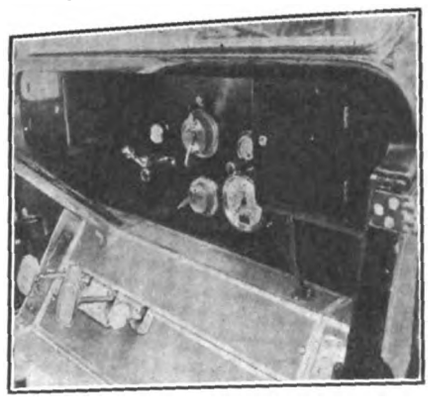
Speedometer Driven from Gearset.

It is very apparent that speedometers no longer are considered luxuries; they form part of innumerable regular equipments, and one almost instinctively looks for the dial on the dashboard and glances around for it when it is not at once apparent. One of the cars that is equipped regularly with a speedometer has, however, a speedometer drive that is "different" and has obvious advantages; instead of the usual drive from one of the front wheels the motion is taken from the propeller shaft, a little casing being attached to the torque tube for the purpose. The flexible shaft is out of the way and the arrangement has an appearance of permanence and neatness that is refreshing. On the same car—the Edwards-Knight—the rear spring suspension, which is of the Lanchester type, is a conspicuous feature; one end of each semi-elliptic spring rests on the rear axle and the other is shackled to the frame, which also carries the bracket for the spring center. Extreme flexibility and easy riding are virtues credited, with good reason, to this suspension system.

There are all kinds of indications that bodily comfort is given serious consideration by builders of other cars, too. In

PATHFINDER WESTCOTT CASE

COMPARISON OF WINDSHIELD MOUNTINGS, SHOWING TENDENCY TOWARD SHORT STRUTS



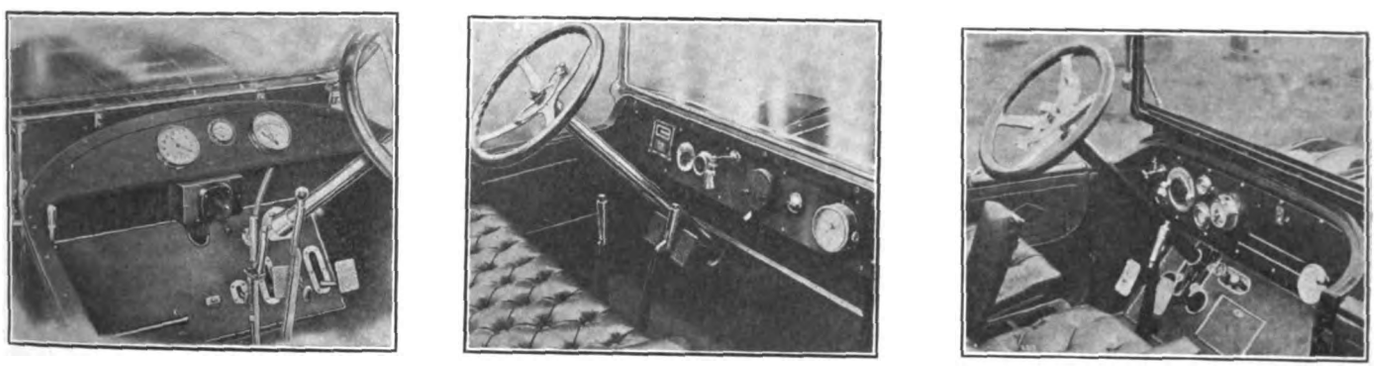
Digitized by Google

one case—the Marion—the springs are imported from England for the reason that they were found to be of just the right degree of flexibility and of just the right temper for that particular car. The apparently sound theory that the up-and-down motion of a car with very short radius rods produces a slight but constant back-and-fourth movement that is tiring in a subtle and unappreciated way, is responsible for the long torque tube of the Marathon car; the springs are shackled at both ends and the vertical motion is so nearly straight that the "fore-'n-aft" motion is said to be eliminated, to all intents and purposes. Anyway, it is a pretty theory.

Bodily comfort is affected by other things than springs, however; and one of them is the amount of space that is available for the stowage of one's feet and legs in a car of the small kind. It is quite an object lesson to see a long-legged six-foot-and-more man get into a little Detroiter and loll back in the seat with his feet the full length of his legs ahead of him, and sit at the wheel without undue prominence of the knees—things made possible by the long body permitted by the arrangement of the platform rear springs.

That bigness is not necessarily synonymous with power or efficiency is rather peculiarly brought out in the design of some of the cooling fans. A few years ago it was orthodox to make the fan pretty nearly as big as the radiator; but now, in the Cole, for instance, the fan is a little three-bladed affair that looks positively insignificant behind the ample radiator. Its efficiency, however, is in its scientific proportion and pitch, and this is true also of the fan of the Edwards-Knight, a four-bladed aluminum casting with blades so narrow that they have caused more than one cigar to change hands as the result of their air-moving ability, as pronounced as it is unexpected, if a first impression is taken as a basis of judgment.

There are lots of things one is given an option on in buying a car—tires, wheels, rims, lighting systems, bodies, and so on—



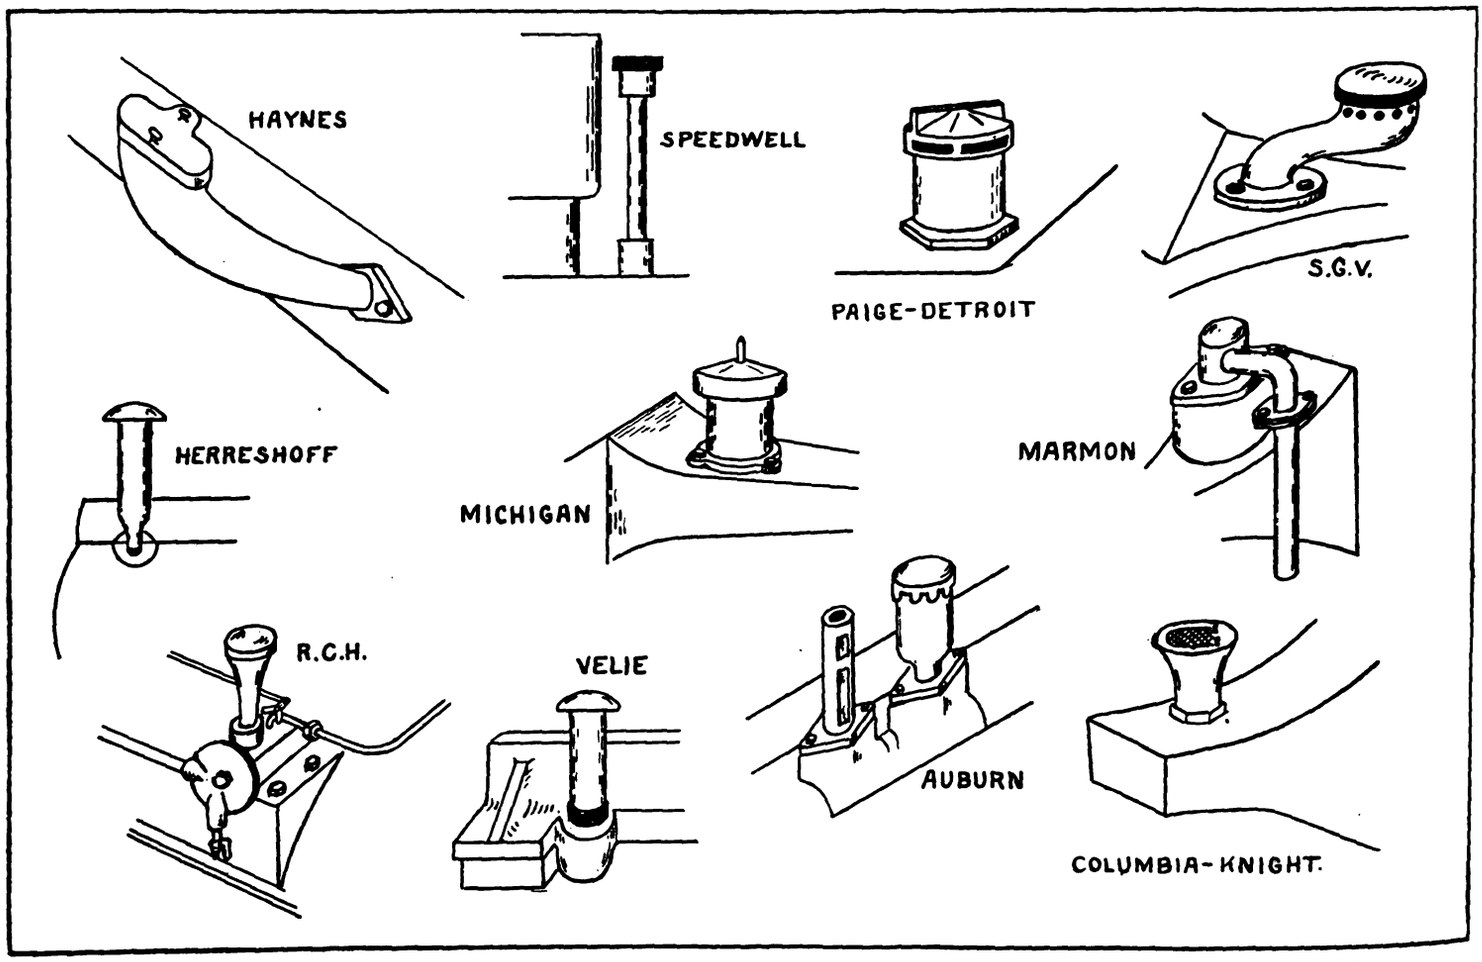
NATIONAL COWLBOARD

who sell the Little "six" give an option of the standard six-cylinder motor or a "four" of exactly the same horsepower built to fit into the same space. If the "four" doesn't suit, change over to a "six," or vice versa. Of course, the "six" costs a little more. The "four" is a brand new proposition, and is a fine job of designing. Its block-cast cylinders—3¼ x 4½ inches bore and stroke—have removable heads, also cast four in a block and containing all the valves, which are seated directly in the casting without the intervention of cages; the exhaust passage opens straight through from the exhaust valves and ends in a discharge opening at the rear of the head casting, and at the opposite, or forward, end is the upper water lead—a big one, by the way. The valve springs are sunk in the water jacket of the head, leaving only enough of the stems sticking up for the rocker arms to act on. Long push-rods from a single camshaft actuate all the valves. The intake manifold is carried to the head casting on the side opposite the camshaft and is a two-branch affair. Just under it is a capacious cast iron oil tank bolted up to the cylinders and connected to the crankcase through a short pipe containing a regulating valve; the lubrication is splashed in the familiar way. The horsepower is 32, the same as the six-cylinder motor, and, as a salesman with a sense of humor explained it, the uncautious prospect is caught coming and going, for if he says he'd like the car all right if it wasn't one of those six-cylinder affairs, he is introduced to the optional "four," and the only alternative to beating an ignominous retreat is to come across with an order.

The number of different shapes a combined breather and oil-filler can take on, and the number of different places where such things can be found, is surprising. Several are found perched on the hollow arms which support the motor, the arm, of course, having no other opening to the air. Incidentally, it is now almost the universal practice to combine the breather and filler. The Michigan motor has its breather on one of the motor arms, and is a good example of the type. Incidentally, so to speak, the eye is very apt to travel from the breather along the arm and over the motor of that same Michigan car and to notice that there are a good many features embodied in it other than breathers. For instance, there is a starter, of the electric type, that drives through the clutch shaft by means of silent chain.

The clutch is a big, capable-looking cone with six plungers under the leather facing backed by adjustable helical springs, the result of this arrangement being extremely smooth and easy starting. A little further back there is a four-speed gearset with direct drive on the top speed. Going from details to generalities, the Michigan appears to be a big car in every way—whether it is the optical effect of the 4½-inch tires, or the moral effect of the "mighty" that the makers use as a prefix, or the capacious-

DEVELOPMENT OF THE COWLBOARD—KNOX, HAYNES AND PREMIER



WARREN COWLBOARD

Digitized by Google

looking bodies, or all combined—and a glance at the price, which is $1,585 with full equipment, somehow makes the car look still bigger.

To get back to breathers: Examples of pipes which have openings that are easily reached for pouring in oil are found in the breathers of the S. G. V., Haynes, Speedwell, Herreshoff and Velie, among others, all of which have advantages that are obvious. The breather and the oil gauge of the Auburn form a pair, while the breather of the R. C. H. is mounted with the oil-

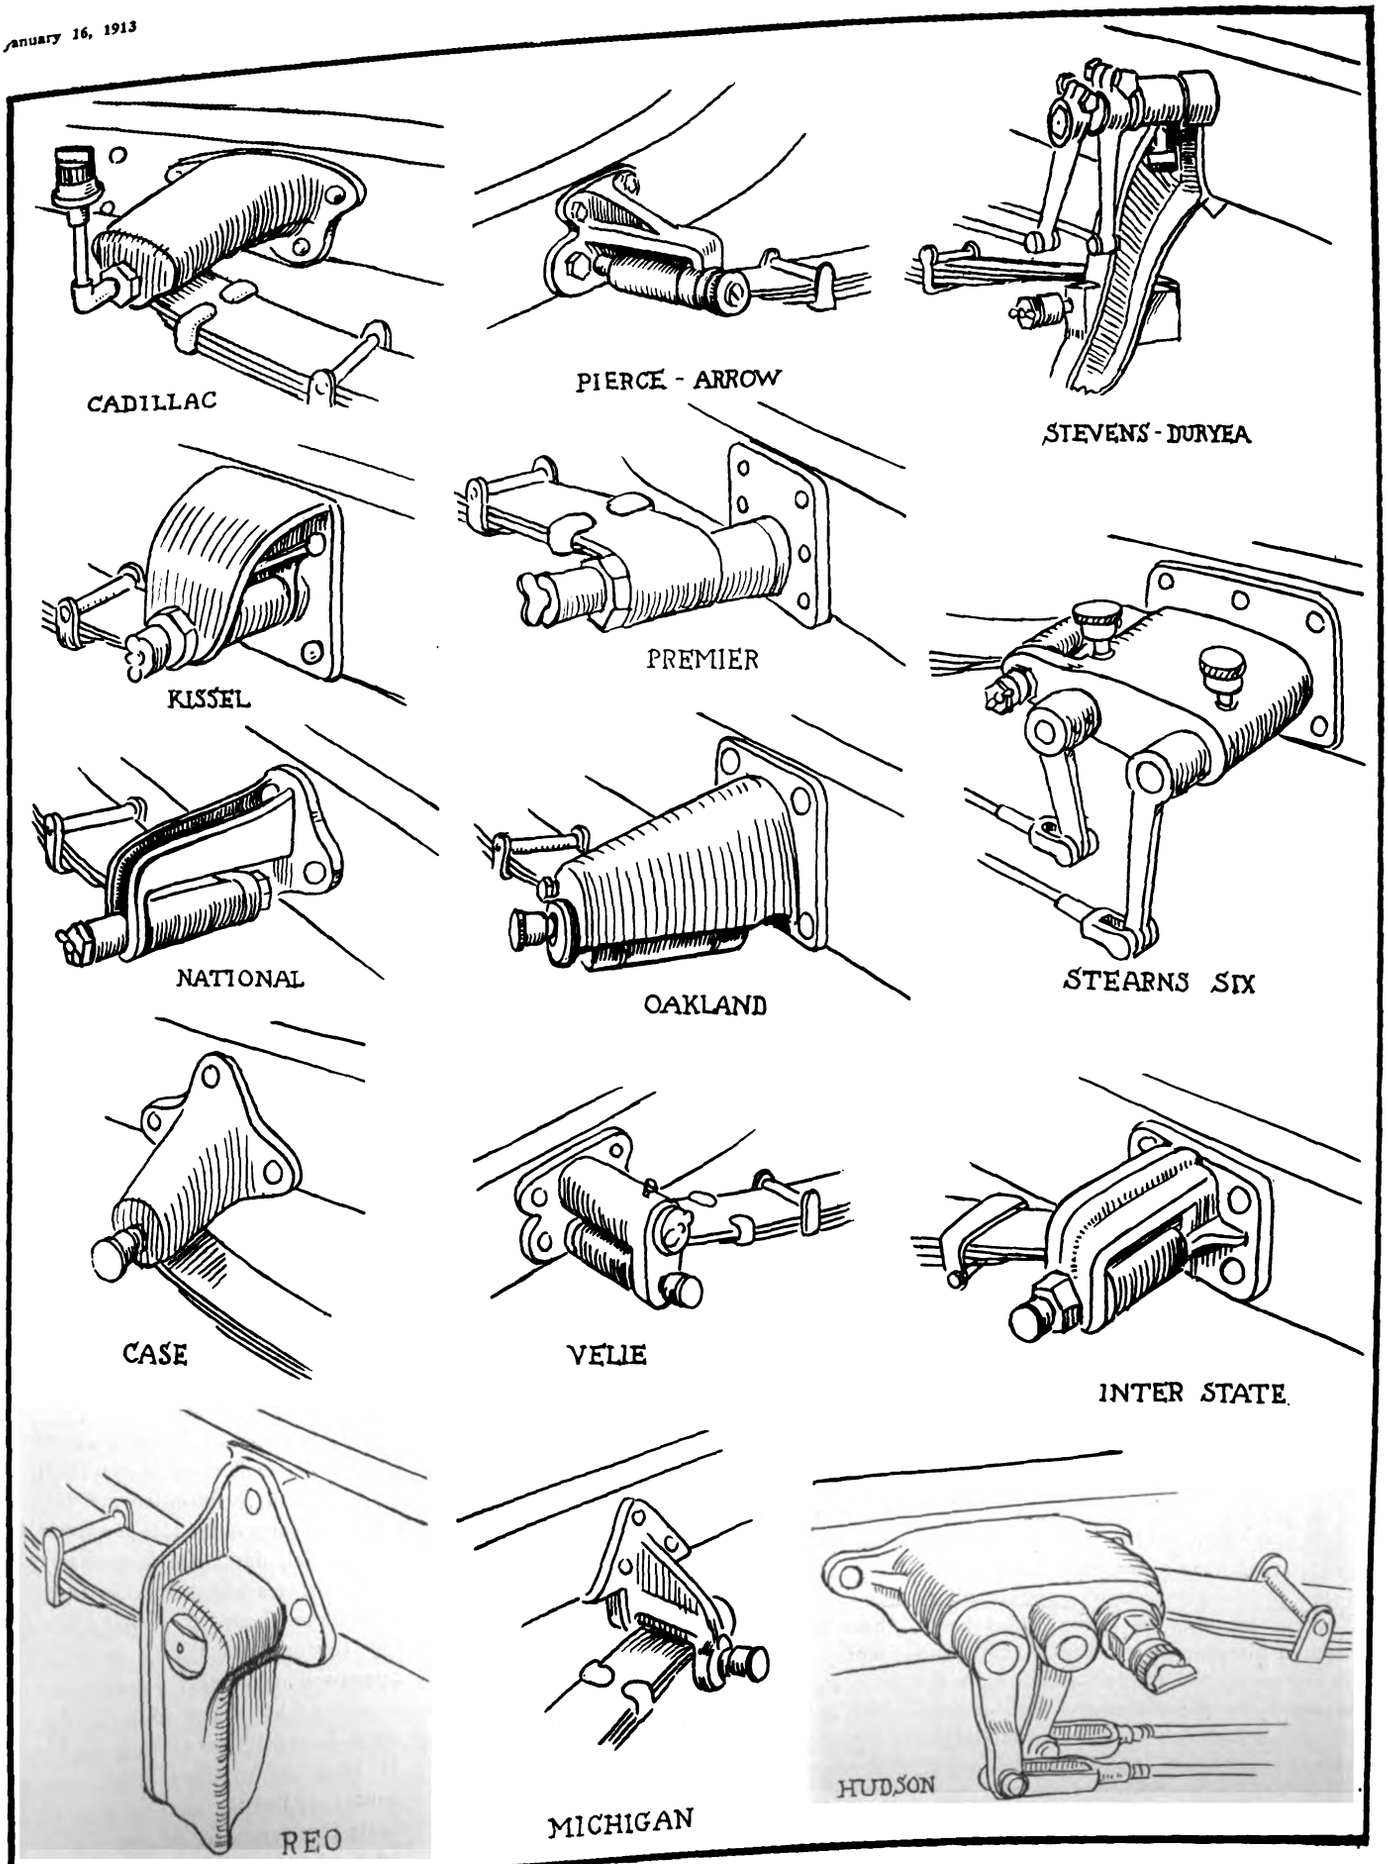
VARIETY IN FORM AND LOCATION OF BREATHER PIPES, ILLUSTRATING THE ADVANCE OF ACCESSIBILITY

pump base. Any stray oil that splashes from the Marmon motor is piped safely downward, so it cannot slop over the crankcase.

Fiat Adopts Plunger Air Pump.

The Fiat cars have used exhaust pressure to force fuel to the carburetter for so long that the method almost may be called "time-honored," but a new method now is in use. In the side of the crankcase there is a tiny, inconspicuous plunger pump, operated by a cam on a little cross-shaft driven by the camshaft, and this pumps the requisite air. It is as neat and unobtrusive as is everything else in the mechanical make-up of that machine. Another kind of a detail—very much another kind—is interesting, when discovered, if for no other reason than that it is so inconspicuous to the casual observer. The sills which rest on the top of the frame, on each side of the engine space, in the Lenox car, are of aluminum, instead of the usual wood, the object being to eliminate the splitting and bruising to which wood is subject under some conditions; the appearance of the aluminum sills is neat and the utility is obvious.

Starter That Resembles "Gas" Motor.



With electric motor starters everywhere in evidence—in profusion, if one cares to apply the term to such things—the Chevrolet people are quite content with their compressed air starter, which is a neat little rotary motor that will turn the engine over at the rate of 300 revolutions per minute and has an exhaust that barks like a young gas engine. There were not a few of those who saw the air compressor, with its two opposed cylinders, who thought it a little gasolene motor, which it resembles very strongly.

Viewing the show in the concrete, one of the striking features that is much more noticeable this year than ever before is the number of cases in which radius rods have been eliminated and the great variety which obtains in the design of the spring hangers, which thus serve a dual purpose in supporting the chassis and taking the drive. In a great many cases, notably on the Cadillac, the Kissel, the Oakland, the Case and a number of others, care has been taken to enclose the spring hanger proper in such a way as to exclude dirt and dust. In other cases, of which the Stevens-Duryea, the Stearns-Knight, and the Hudson and others serve as examples, advantage has been taken of the spring hanger housing as a means of mounting the brake rod cranks and, as may be seen by the accompanying sketches, the arrangement is "neat," to say the least. In still other cases, such as the Reo and a long list of others, the spring hanger is made to serve also as a bracket for the running board. Among the cars that employ a perfectly plain and equally accessible spring hanger devoid of housings or double purposes are the Pierce-Arrow, the Premier, the National, the Velie, the Inter-State and the Michigan.

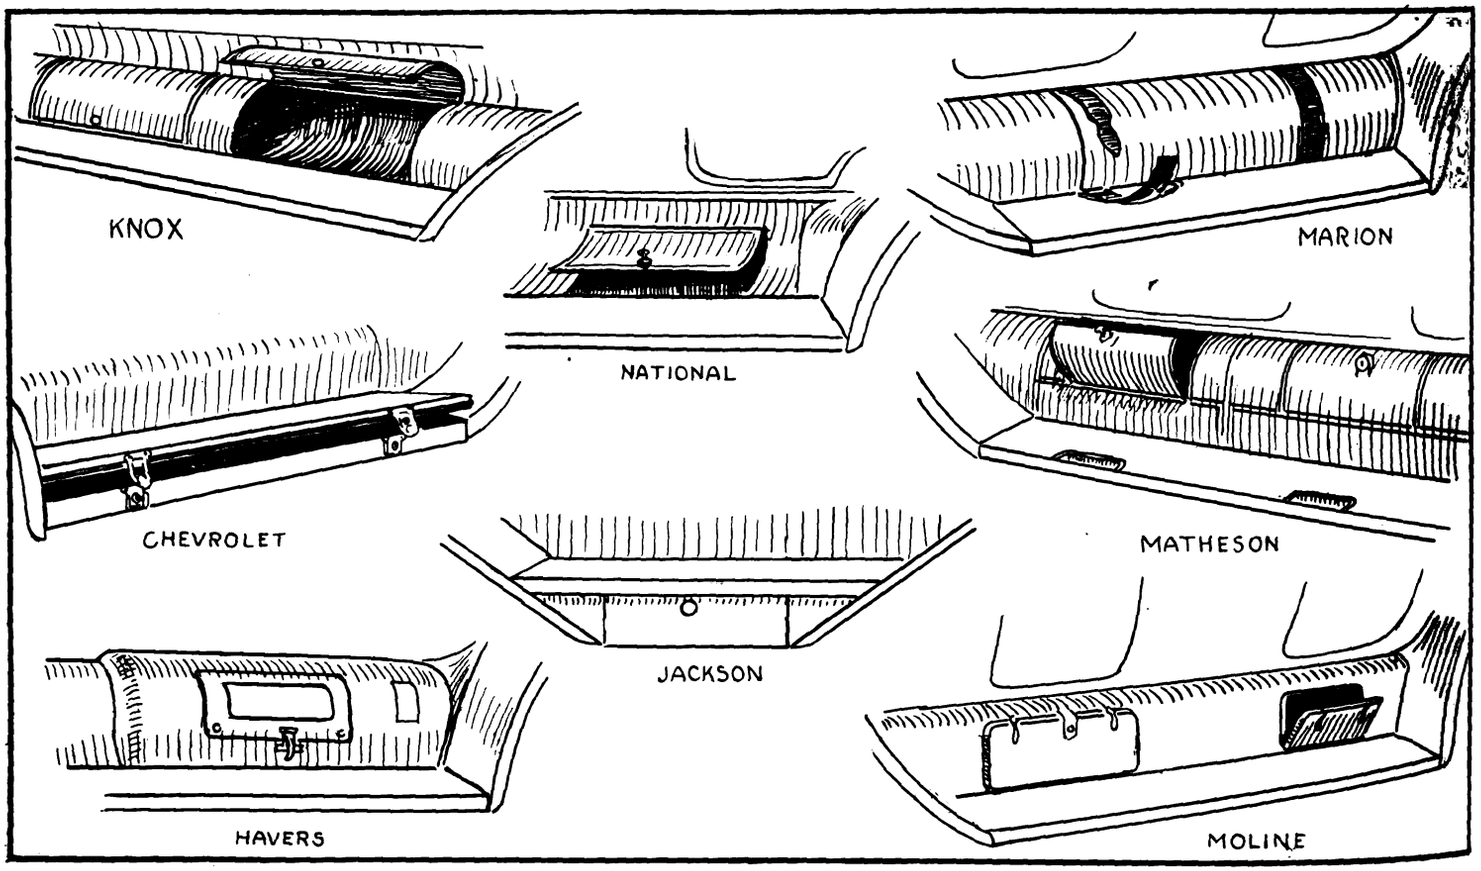
Landslide to Electric Equipment.

Still another feature which is more than ordinarily apparent, though it should be no surprise by reason of the fact that it was forecast in Motor World's Before-Shows Issue, is the landslide to electric lighting and engine starting equipment. Considering

Digitized by Google

[illegible] HANGERS—SURPRISING DIVERSITY DISCLOSED BY CRITICAL EXAMINATION

Digitized by Google



all the gasolene cars at the show—86 brands of them—68, or nearly 80 per cent., are regularly equipped with electric lighting systems and all but a few have electric cranking devices as well, the latest additions to the list being the Locomobile and the Franklin, both of which appear for the first time with such equipment.

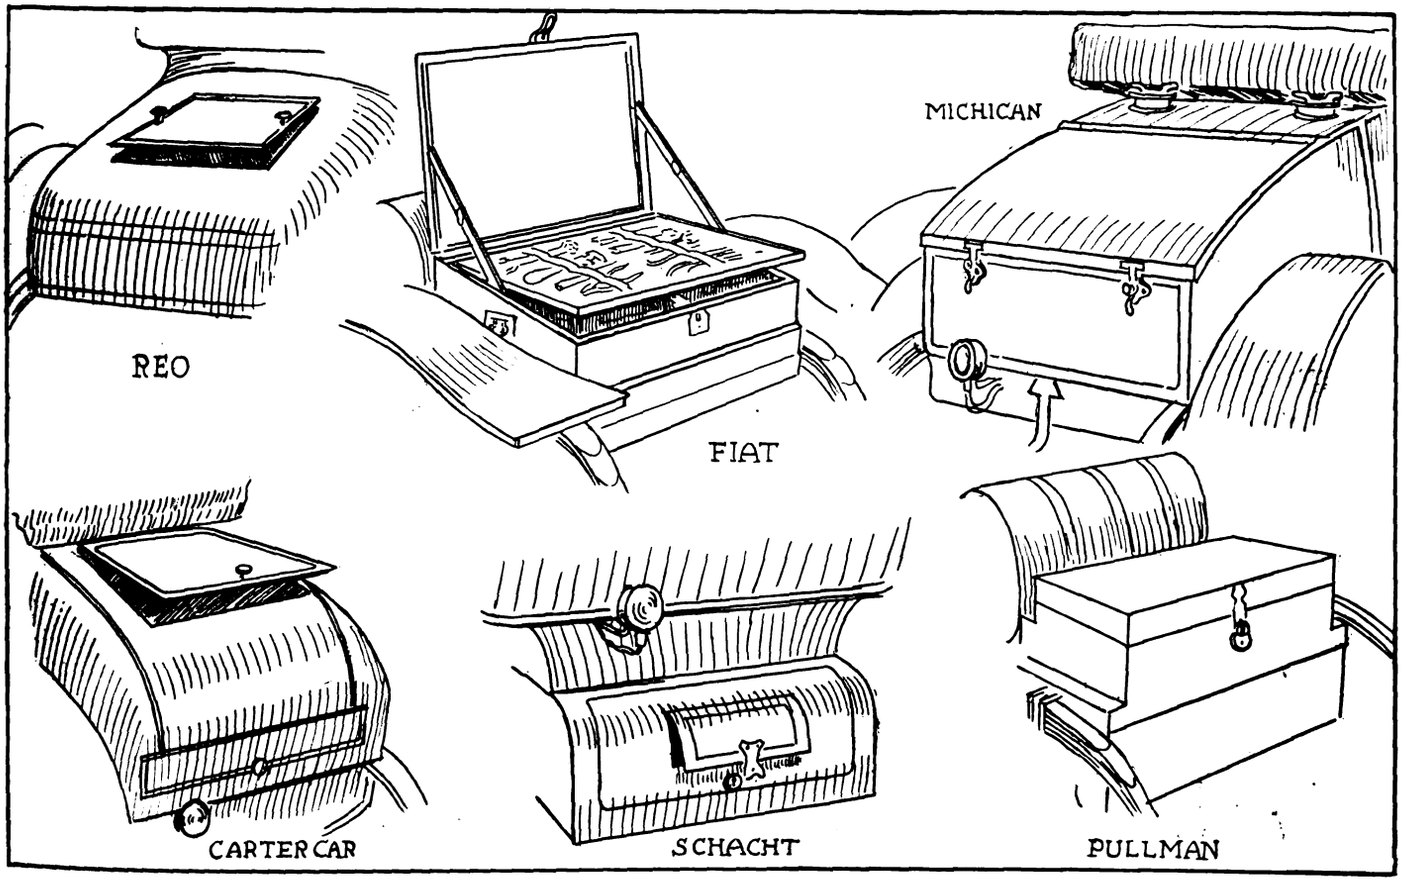
Naturally, with such a long list, there exists considerable variety in the method of mounting the generator and the starting motor. For the most part, generators are mounted at the side of the engine, where they may be conveniently driven from the pump or magneto shaft or from the crankshaft by means of a "silent" chain at the front of the crankcase. Much greater variety is apparent in the disposition of starting motors, though in a great many cases engine positions with the drive through the timing gear train are preferred. In the Reo, for instance, the starting motor is mounted transversely on the chassis frame between the clutch and the gearset and is connected to the clutch shaft through the intermediary of worm gearing, the worm wheel being mounted directly on the clutch shaft with the worm on the electric motor. In the Haynes and the Cadillac and the Locomobile and a long list of others, the starting motor is attached to drive the engine through the intermediary of gearing cut on the flywheel of the engine. And in two instances, the Pathfinder and the Herreshoff, the electric starter is built into place on top of the flywheel housing in such a way that the whole power plant becomes in all truth a single unit.

Utilizing Former Waste Spaces.

The mere phrase "clear running boards," which applies to very nearly every car at the show, scarcely is enough to convey its real meaning, particularly in view of the fact that the demand for storage space for tools and tires and odds and ends has decreased no whit, though the demand for the suppression of unsightly tool boxes and other receptacles has increased quite perceptibly. Another surprise of a mild sort is to be found in the many ways in which the difficulty suggested by the problem has been overcome. In a great many cases, notably on the Alco, the Marion, the Matheson, the Pullman, the Columbia, the Kissel and a raft of others too numerous to mention, manufacturers have taken advantage of waste space beneath the frame, or just above it and below the body proper, and have provided clever little "cubby holes" with entrances through the shield between the running board and the frame. Where the shield is convex, as in the Knox and the Marion and a few others, the locker space thus obtained is quite appreciable and almost is sufficient without other provision. Lockers of the kind alter the appearance of the car not at all, except for the addition of a small catch of some kind and the elimination of the tool boxes which hitherto have perched on running boards.

Where still more space is required, or the design of the car will not permit of the use of such cleverly hidden resting places, there are several other locations which are chosen with very nearly equal frequency. The first of them is the dash, particularly where a deep skuttle is used, and the second is the arm rest between the front seats, neither of which locations has been used to any great extent up to the present time. Where the skuttle is deep, there is an abundance of space between its uppermost edge and the floor which is not needed for foot-room and which nominally would go to waste. Manufacturers have not been slow to appreciate that it may be put to a useful purpose for the storage of small tools or spare parts that are too small for inclusion with the larger tools and parts in the tool box proper. Generally, such dashboard lockers are placed in the corners and their doors are guarded with locks, though in several instances, in the Garford and the Cartercar and the Speedwell and others the whole of the space is utilized by making of it either a single large locker or two or more smaller ones. It is a comparatively simple matter, of course, to line the space between the front seats that serves for an arm rest and fit it with a lid, thus providing a more than ordinarily handy receptacle for goggles and

CLEARING THE RUNNING BOARD—SOME EXAMPLES OF METHODS EMPLOYED AND STORAGE SPACE ACQUIRED



Digitized by Google

veils and gloves. In several cases, the space between the seats has been utilized to house lighting and starting switches that otherwise would crowd the dash, and in other cases the gasolene tank filler pipe has been brought up between the seats where it is accessible without the necessity for disturbing the passengers.

Where gasolene tanks have been moved from their time-honored place beneath the front seats and relegated to a place of greater conspicuousness in proximity to the rear axle, still more storage space is available, curtains and spare tubes are carried in a pocket at the back of the front seats.

Just why the occupants of a roadster are expected to carry at least three times as much luggage as the occupants of a seven-passenger touring car may not be plainly apparent, but that such is the case is revealed by the exceptionally roomy "trunks" and other storage spaces that are provided on the average roadster. The after deck, to use a nautical expression, forms an ideal place for the location of such conveniences, which serve also to complete designs which carries a tray in which the tools are fitted in such a way that they cannot rattle; the space beneath is available for anything the owner may choose to put in it. One other instance which serves to illustrate the extent to which otherwise waste space has been put to some useful purpose is to be found in the Cole limousine. At the back corners, at about the level of the eyes, there are deep, dark pockets that are concealed by flaps made of the same material as the upholstery.

For variety in the location of lockers, and

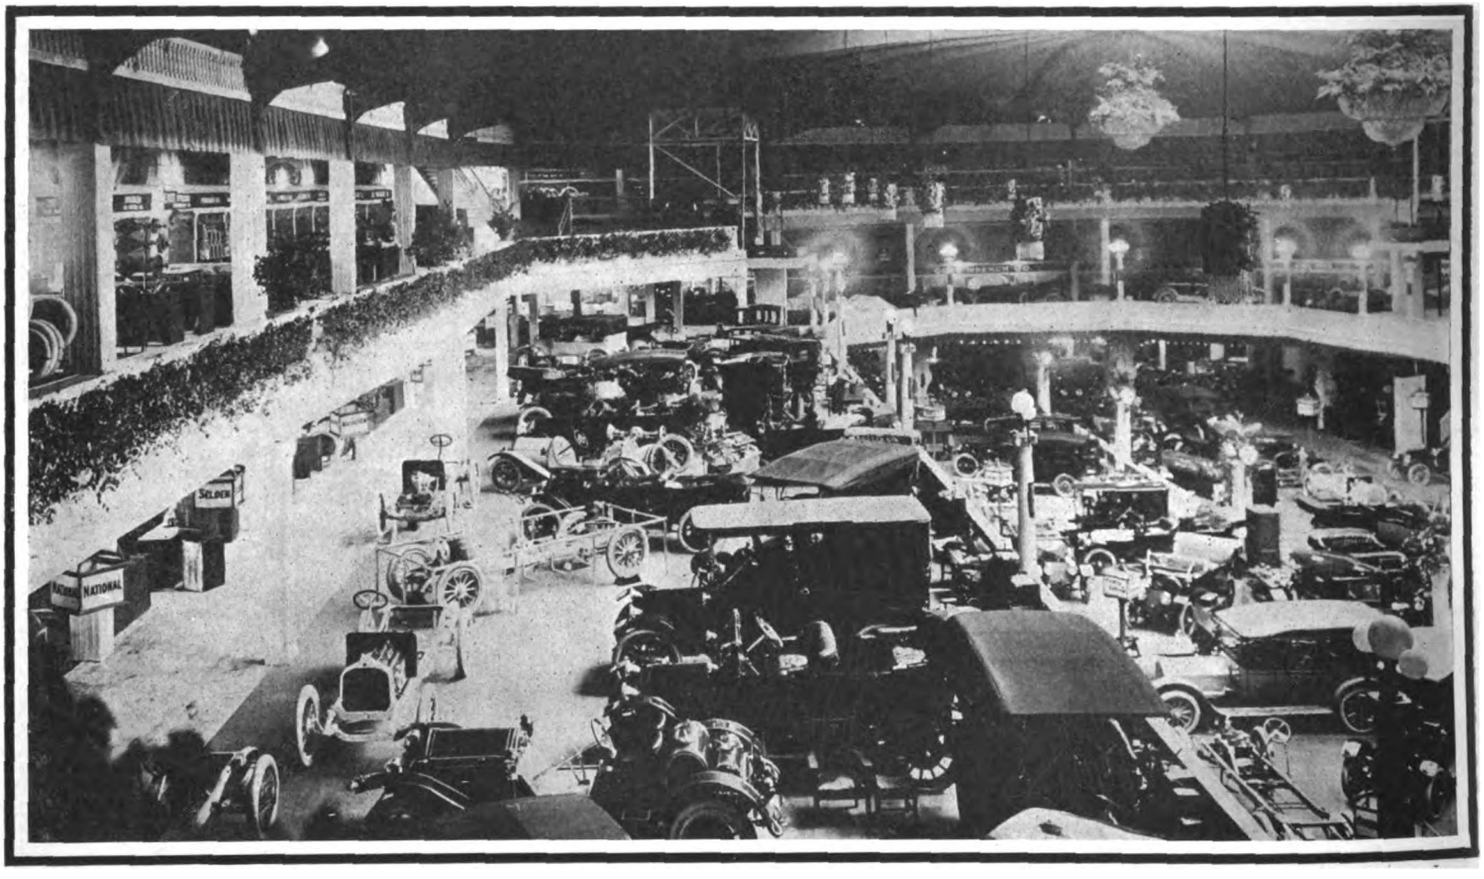
REAR DECKS OF ROADSTERS THAT FACILITATE THE CARRYING OF TOOLS AND OTHER THINGS

and not a few manufacturers have made it more accessible by making the riser into a door.

The space beneath the rear seats always has constituted the chief hiding place for tools and tubes, and this space, too, has been made more handy in a number of instances by placing a long door at the front, thus obviating the necessity for removing the seat cushion every time something is needed; the Kissel is only one example of many of the kind. Several makers now locate side curtains in especially prepared compartments under the rear seats, and two of them—the Mercer company and the Oakland company—have killed two birds with one stone, so to speak, by providing liberal sized lockers in the form of tonneau foot rests. In the White cars, side

otherwise might appear unfinished. The rear of the Michigan roadster, for instance, is exceptionally roomy, though its appearance is neat withal; a single large, rear compartment with an up-lifting lid serves for storage space for all the tools and parts and all the luggage that the average car can be expected to carry, and houses the fuel tanks as well.

Making Division of Rear Spaces.



In the Cartercar, the after deck is in two compartments, one above the other, the larger serving for luggage and the smaller, which is the full width of the body, for the housing of space tires and tubes. At the back of a Fiat roadster, which, by the way, is one of the very few red cars at the show, is fitted with a tool chest and locker that

the actual amount of storage space provided for the size of the car, none can hope to approach the Premier cabriolet, which quite appropriately has been named the "Killarney Coleen." It is a beautiful piece of work, finished in green and gold, and the number of "bunks" and "cubby holes" it conceals is nothing short of remarkable. In the first place, there is a great big locker at the rear that serves to house the storage batteries, with plenty of room for tools. In the dash there is what has been styled a "cellarette" that is large enough to hide a sufficient quantity of cheering fluid to make almost any one want to cheer. But the largest space of all—a space that is large enough to carry an outfit of clothing for nearly any kind of a function that a motorist might be expected to attend, from a fight to a frolic

Digitized by Google

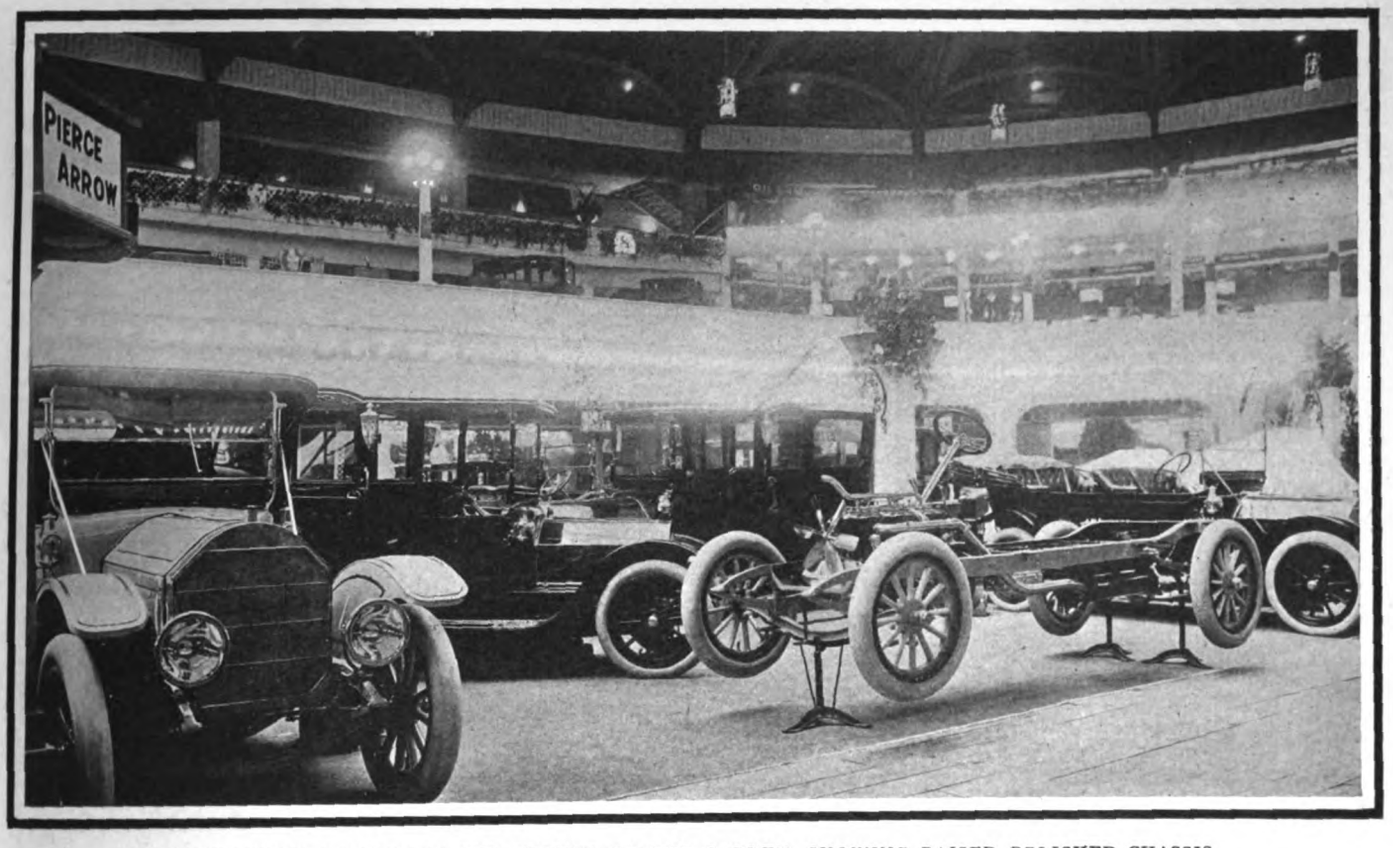
—is behind the back of the seat, and it is so cleverly hidden that none but those who know the combination may expect to find it. The back of the seat hinges forward, revealing a cupboard large enough for two suit cases, to say nothing of room for three or four Thermos bottles and a good sized package of lunch.

The Premier "Killarney Colleen Cabriolet" is otherwise distinctive, also, as the nearest approach to a landaulet at the show. Strictly speaking, it is not a landaulet, of course, though the back lets down just like the back of a landaulet. The back portion of the roof is made of green leather, and it is one of the wonders of those who view it just how the painter managed to match the body and the leather so perfectly. The body is belted with red and fitted with red trimmed wire wheels.

LOOKING DOWN ON THE ELEVATED PLATFORM ON WHICH BOTH CARS AND ACCESORIES ARE DISPLAYED

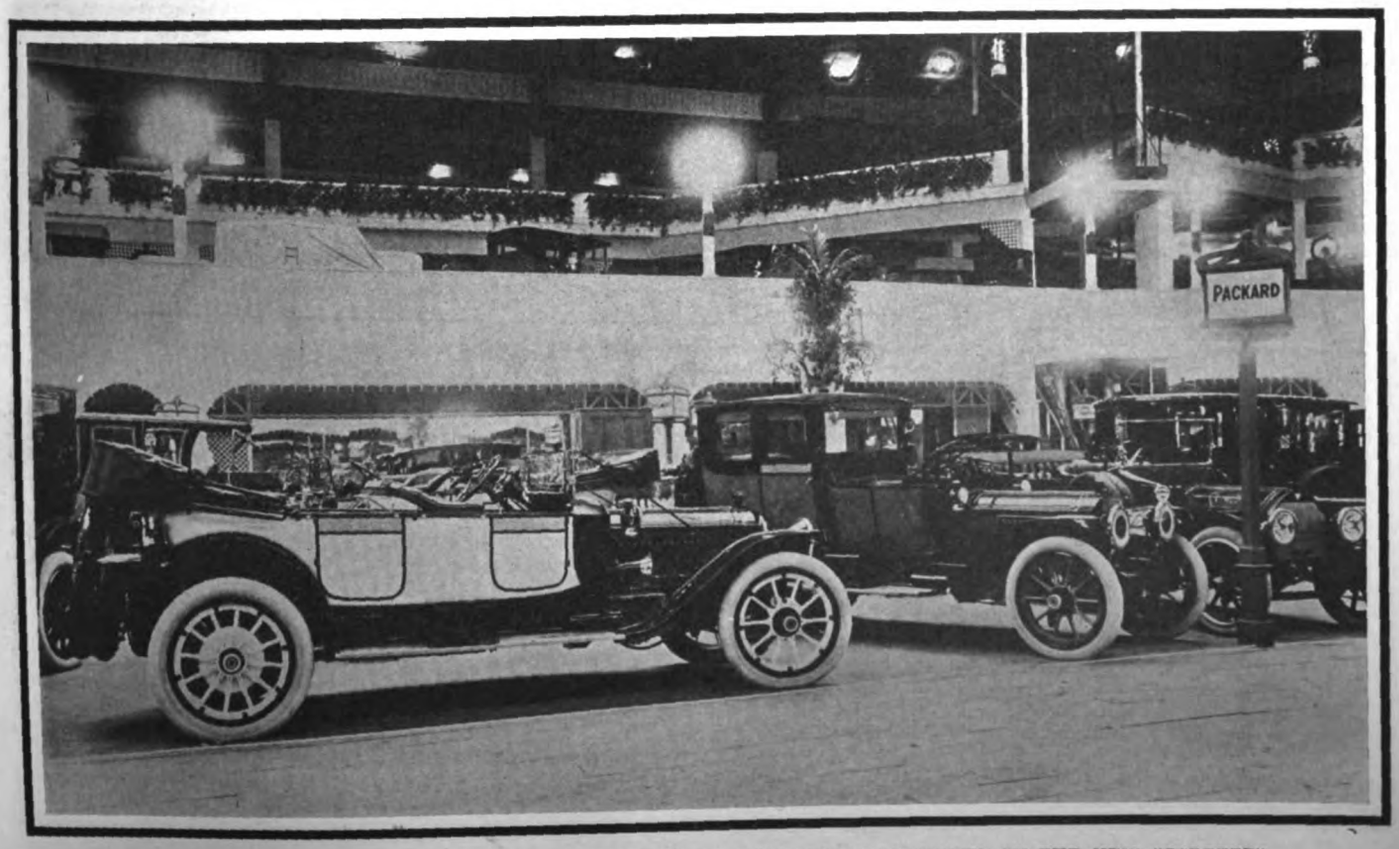
Ventilating Front Compartments.

As a general rule, greater attention has been paid to the ventilation of the front compartments of open bodies, the realization apparently having sunk in that the heat of the engine is an undesirable adjunct to the heat of the sun on a summer day. In closed bodies, however, there still exists a lamentable lack of ventilating methods, few makers going to greater trouble or expense to provide fresh air than to supply miniature shutters up near the roof in the partition between the driver and the other passengers. Few realize that fresh air will find no ingress unless the foul air is expelled or permitted to escape, and though it always is possible to open a window and in that way to create a draft, drafts are not always appreciated. In appreciation of the necessity for ventilation in closed bodies, only one maker, as revealed by the cars on exhibition, has attempted a solution of the problem. The innovation is to be found in the Hupmobile coupe, an unusually "square" body with a goodly sized circular ventilating dome in the center of the roof; as a matter of fact, the dome, which is so flat as to be just apparent, occupies very nearly all of the roof, and there can be little doubt but that it provides an abundance of fresh air without the inconvenience due to drafts.



With regard to ventilation, it is interesting, or, rather, amusing, to observe that quite a few makers quite unconsciously have provided a method of heating closed bodies that is not always desirable and that may prove really obnoxious, as well as noxious, to those of delicate sensibilities. The method consists, briefly, in leaving open the lower end of the compartment into which the windows between the front and rear compartments drop. Where the underpan is continued back far enough, and in the majority of cars it is fairly long, heated air from the engine compartment is pumped directly into the body.

Of course, it needs no elaboration to make plain that seat cushions have become just about twice as thick in the past year as they were previously, and another feature which is common to a great many cars is a general up-tilting of the front of the cushions for the purpose of conducing to greater comfort. Also, in at least two instances, notably the Stoddard-Dayton and the Stevens-Duryea, means for liberal adjustment of the seats is provided to accommodate them to the long and to the short. The Stoddard-Dayton arrangement is not new, of course, for it appeared at the last show; it applies only to the front seat. In the Stevens-Duryea, however, the adjustment applies to the tonneau seat and is unusual in that it may be made at will and with no greater effort than the turning of a conveniently located wheel. The seat may be moved forward three inches and the front may be raised two inches instantly and easily.



Convenience of Greater Leg Room.

Coincident with the general increase in wheelbase lengths, it follows that leg-room has been increased in the majority of cases, and with few exceptions elbow-room also has been increased in proportion. However, little variety in the method of arranging seats is apparent, the majority of makers preferring to stick to the orthodox arrangement. One exception is to be found in the

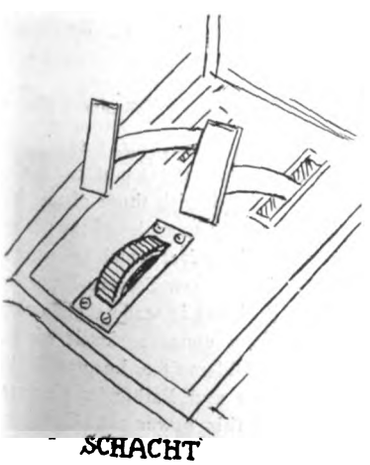
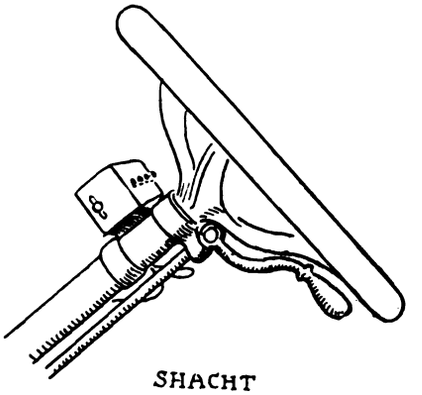
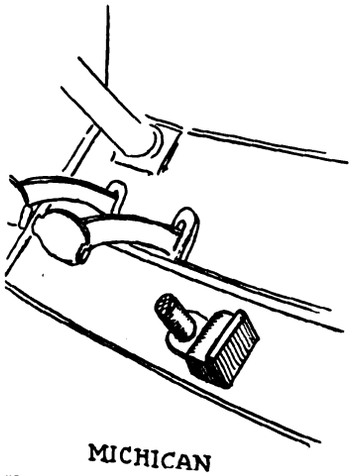
FLANDERS



BUFFALO ELECTRIC SPRING



PACKARD



In one respect, the exhibition would seem to indicate a retrogression instead of an advance, judging by the standards that were set last year. To those who have good memories, the clean and clear dashboards of last year's cars can be easily recalled—the order of the day was "nothing on the dashboard that can be placed elsewhere." Now, however, everything is placed on the dashboard, and though the practice is a laudable one in that it places the operation of the car right under the gaze of the driver, leaving little to guesswork, it tends also to increase complexity. Indicative of the fact, several manufacturers of electric lighting and engine starting systems incorporating ammeters have substituted for these devices plain indicators, or annuncia-

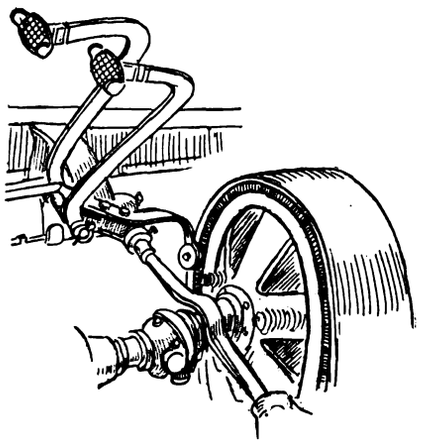
PEERLESS STRAIGHT-LINE BODY—THE SEVEREST IN THE SHOW

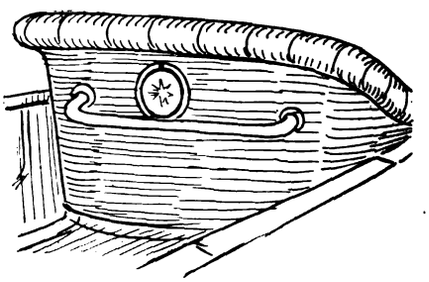
tors, which tell at a glance whether the battery is "charging" or "discharging," thus doing away with the added confusion that might be bred of inability properly to read a meter.



Side by side with ammeters or indicators there are oil and gasolene gauges, ignition switch, carburetter adjustment, speedometer and clock, engine starting control, lighting control and any other devices that the maker may deem of sufficient interest to the owner to be placed before his eyes. As a matter of fact, no inconsiderable number of makers deliberately have created supplementary dashboards practically for the sole purpose of mounting such devices. "Cowl dashboards" they are styled, and even though they do give the average automobile dash the appearance of the end of a locomotive boiler with its multitudinous display of gauges and cocks and whatnots, they serve a useful purpose, always assuming that the equipment on them is absolutely necessary, in taking the various gauges, controls, etc., out of the obscurity of the dashboard proper and placing them where they can be seen and, what is more to the point,

LOZIER STEP LIGHT

where they can be reached by the driver from his seat.

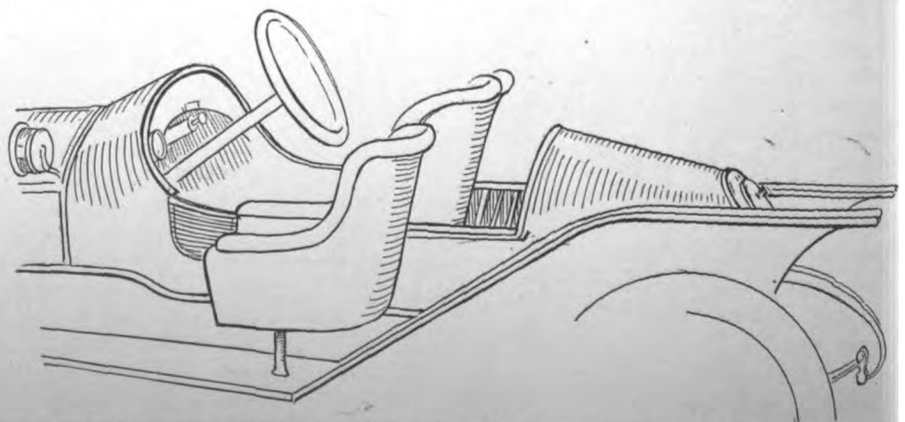


Though there probably is less necessity for a dash lamp on a cowl dashboard for the reason that its instruments are very much more exposed than when mounted beneath a deep skuttle, the majority of such dashes nevertheless are fitted with lamps, which is natural, inasmuch as the amount of current they consume scarcely is measurable and there is practically an inexhaustable supply at hand. Also, small electric lamps now make their appearance in places which heretofore have been foreign ground to them. In the Garford touring car, for instance, there is a tonneau lamp—a dome—set in flush with the back of the driver's

MICHIGAN CLUTCH ASSEMBLY

seat; several makes of cars are fitted with plug sockets on the dash, from which a lamp on an extension cord can be carried almost anywhere about the car; several cars are fitted with step lamps which burn only when the tonneau door is opened; a Lozier limousine is fitted with a step lamp of the kind fitted flush with the back of the driver's seat near to the floor. Cigar lighters that glow in a manner to discourage the fiercest of breezes, also are standard equipment on a number of cars, and on the Pullman the electric equipment is complete, even to a tire vulcanizer.

In the manner of illuminating the insides of closed cars, there is not a great deal of variety, the majority of manufacturers making use of a standard form of Pullman



GARFROD TONNEAU LAMP

lamp which ordinarily is nothing more than a small polished plate; the plate rotates in a socket, however, revealing a small lamp mounted on the reverse side which lights up automatically when the plate is shifted. Dome lights in the roof are fairly common, and in the Selden a single dome in the center is supplemented by smaller domes in the rear corners; the corners of the Winton limousine are a little more ornate with miniature fixtures mounting two lights, and in the Locomobile "show" limousine truly artistic pillar lamps help to make beautiful the interior.

Blending of Lines a Prominent Feature.

To the careful observer, there is apparent a much greater attempt to blend the lines of the hood with those of the skuttle dash in a manner to make of the two practically one unit, a fact which is particularly noticeable in the new Stevens-Duryea cars, in which the hood is made slightly sloping and joins to a concave skuttle without a break. The Oldsmobile, Locomobile, Peerless, Westcott and Pathfinder all serve as examples of this newer art. Carrying the idea a little further, the Mitchell and the Norwalk and a few others have side lamps mounted flush in the filler board of the windshield instead of in the dash proper.

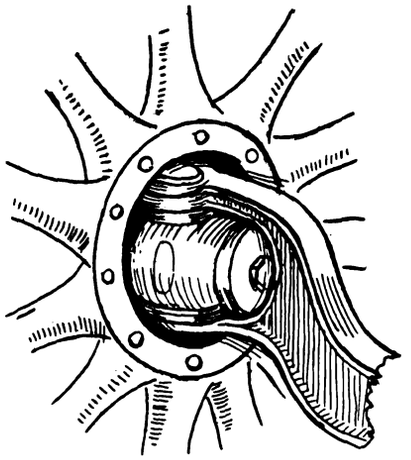
COLE THREE-SEATED ROADSTER SHOWING LUGGAGE SPACE

Digitized by Google

Similarly, the idea of mounting the side lamps in integral projecting tubes on the skuttle—small tunnels, as it were—is more prevalent than it was, and on several cars, among which the new Oakland is one of the most noticeable, very pleasing effects have been obtained by deviating materially from stereotyped lines.

Variations Among Accelerators.

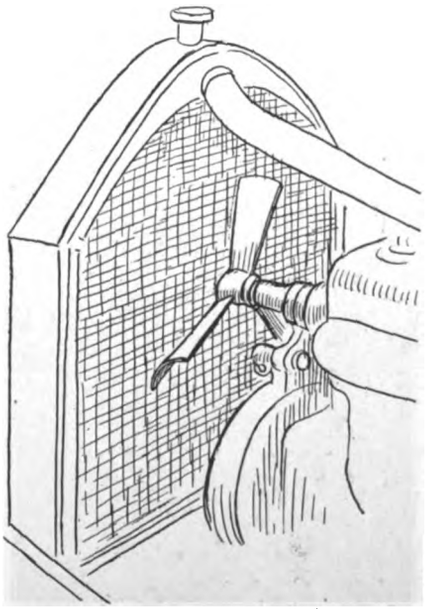
Probably appreciating the element of danger in the unprotected accelerator pedal and by way of providing greater comfort for the driver, a number of makers have adopted pedals that are quite different from those that have been used in the past. On the Michigan cars, for instance, the accelerator is a small, round button and is provided with a foot rest to ease the strain on the driver's leg muscles; in the Schacht, the accelerator is nothing more or less than a small gear wheel with very fine teeth, the result being that it is impossible inadvertently to "step on it," while at the same time holding it open continuously imposes no unnecessary strain on the driver; in Westcott cars much the same result is obtained, though the arrangement is quite different, the pedal swinging sideways behind a rest for the driver's foot; the Flanders accelerator is a roller and it, too, is provided with a foot rest.



Arrangements of Control Devices.

Placing controls of one kind or another, and in some cases all controls, nearer to the operator than is possible even when they are mounted on a cowl dashboard, quite a few makers have made use of the steering column to mount various devices. In the Packard, all the controls are centralized on a steering column box and a somewhat similar arrangement is made use of on Schacht cars, in which the steering column unit carries the lighting switches and the signal button; the starting gear control is located beneath the steering wheel, where it is instantly accessible. The location of carburetter adjustment controls on the steering column is fairly common practice and is to be found on Marion and National cars and a long list of others. On the new Studebaker cars, the signal horn button is mounted directly on the steering wheel, with the wires leading down the post in a neat metal housing. The starter control on the Studebakers also is mounted on the steering column and is nothing more than a small ring which is attached to a metal cord which sets the starter in motion; the cord is carried within the steering post and thus is out of the way and impossible of accidental derangement.

Another of the fine points in new design which has as its object the betterment of construction in general and to obtain easier steering and a shorter turning radius, to be specific, is to be found in the Marmon "six" steering pivot. The pivot proper is contained within the hub of the wheel in such a manner that its center is in the same plane as the center of the wheel.



Efforts to Attain Riding Ease.

It is just possible that the uninitiated might gain the impression, after looking

MARMON STEERING KNUCKLE

at the rear springs of the Buffalo electric cars, that the graceful scrolled effect was introduced for decorative purposes. While there is no doubt that the springs are good to look at, they were designed primarily

COLE COOLING FAN

for easy riding; vibrations are damped and taken up in passing through the convolutions of the ends, and the machine rides with a softness and ease that is an indication of the fact that the curves were put in for something more than ornamentation.

Unusually easy riding is one of the claims put forward by the makers of the King for the attractive little car bearing that name. The rear springs are of the semi-elliptic cantilever type—that is, one end of the spring rests on the axle and the other end, as well as the center of the spring, are linked to the frame; a distinct shock-absorber effect is produced on a rough road.

Two Cars of Distinctive Features.

The new Schacht, an unheralded exhibit, is a fine, roomy five-passenger touring car with 45-50 horsepower block-cast motor, cone clutch, three-speed selectively controlled gearset and final drive by means of the usual shaft and bevel gears to the full-floating rear axle. The wheelbase is 120 inches and the 36-inch wheels are fitted with 4-inch tires. Left steer and center control are features, and it is an indication of the up-to-dateness of the machine that it is equipped with an electric lighting and starting system.

The Keeton exhibit, a six-cylinder touring car and a six-cylinder chassis, came direct from the Importers' Salon to the Palace, where the less limited space gives a much better opportunity to get an idea of the really fine appearance of the machines. If there is anything in combinations the Keeton ought to be considerable of a car, claiming, as it does, a European model, an American designer and a Canadian factory.

LOOKING DOWN ONE OF THE BALCONY AISLES IN THE PALACE, THE CHEVROLET EXHIBIT IN THE FOREGROUND

Unexpected Things That Cropped Up in the Accessory Department

As is always the case, much that is new, novel and unexpected cropped up in the formidable display of parts and accessories; not even the far-reaching and pains-taking efforts centered in Motor World's Before-Shows Number served to bring all of them to light; indeed, not a few of the new things in evidence are displayed by makers who did not even figure on the official list of exhibitors; they came into the show at practically the eleventh hour. There always are a number of these "eleventh hour people," but this year the number is very much larger than ever before. Even some of the large, and well-known, and well-established makers of parts and accessories apparently attached so little importance to some of their newer, and perhaps smaller but none the less interesting wares, that they said nothing about them in their advance reports. In other cases, they evidently purposely "held back" one thing or another in order to provide what may be termed a "show surprise." As a result of these several inclinations, the wealth of novelty is unusually large, even if all of it is not of absorbing interest.

Lighters and Starters.

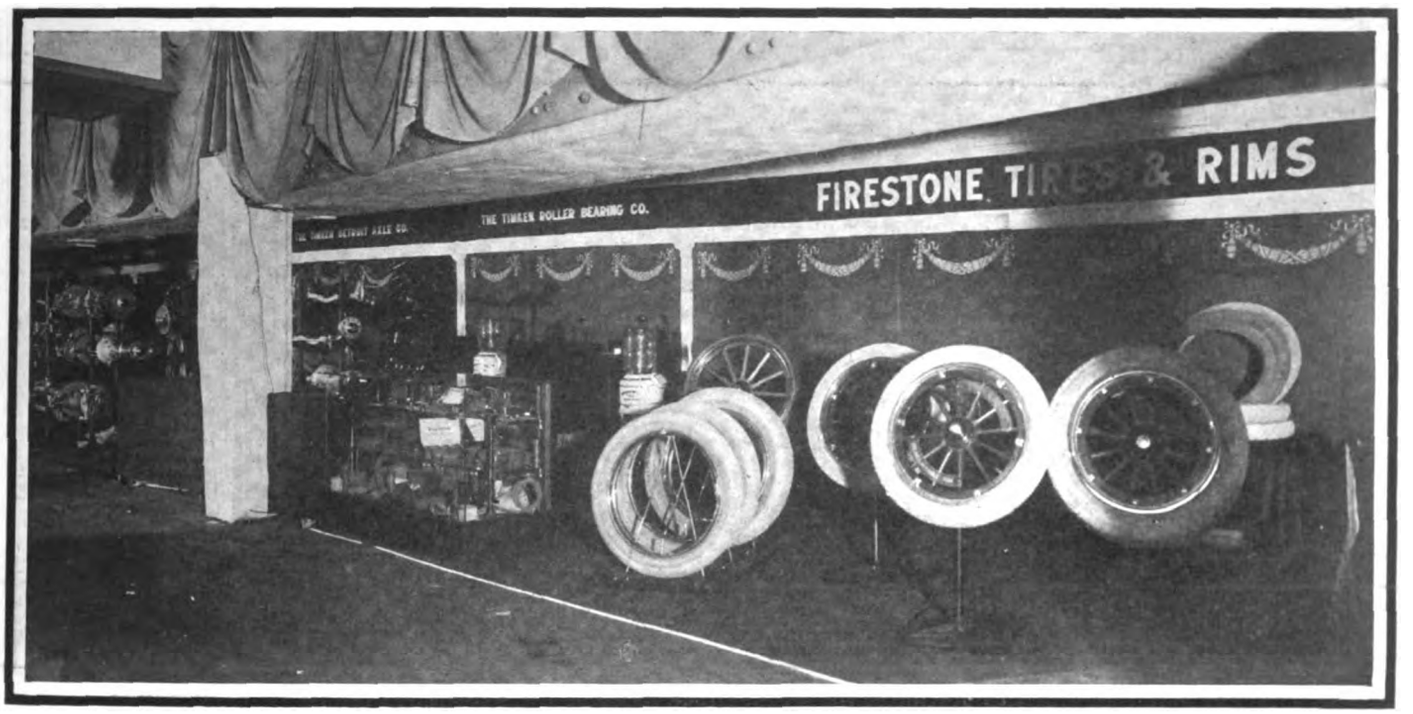
Three almost unheralded electric lighting systems are exhibited for the first time, two of which—the Briggs, made by the Briggs Magneto Co., and the Gould, product of the Gould Storage Battery Co.—are brand new; the third is the Westinghouse system. All three are similar in that they embody the means for accomplishing ignition in the same instrument and all are electircally governed to prevent excessive voltage at high engine speeds, by means of a differential field, or bucking field, which comes into play when the voltage passes a predetermined point. In the Westinghouse instrument a cutout which disconnects the generator from the storage battery when the voltage

DEAN CENTURIAN

of the latter is greater than potential at the machine terminals, is operated by a centrifugal governor; in both the Gould and the Briggs a magnetic cutout is provided. The Gould system is distinctive in that the armature is doubly wound, delivering direct current at six volts from one side and alternating current for ignition work at the other. In all three systems quick-break circuit breakers and high tension distributers are provided; in the Westinghouse the circuit breaker is fitted with two contacts.

The Splitdorflite, as the electric lighting system made by the Splitdorf Electrical Co., Newark, N. J., is called, has been remodeled and has emerged from the process with a differentially wound field by means of which

Digitized by Google



the voltage is kept constant, regardless of the motor speed, and with commutator of such liberal proportions that sparking is prevented even when the device is short circuited and is delivering its maximum, 40 amperes. The newer device, or devices—for the Splitdorf instrument is made in two sizes—is made primarily for use at low speeds, and to this end the maximum voltage is obtained at 350 revolutions, at which point the magnetic cutout closes, connecting the generator with the battery. The device attaches to the half-time shaft of the motor.

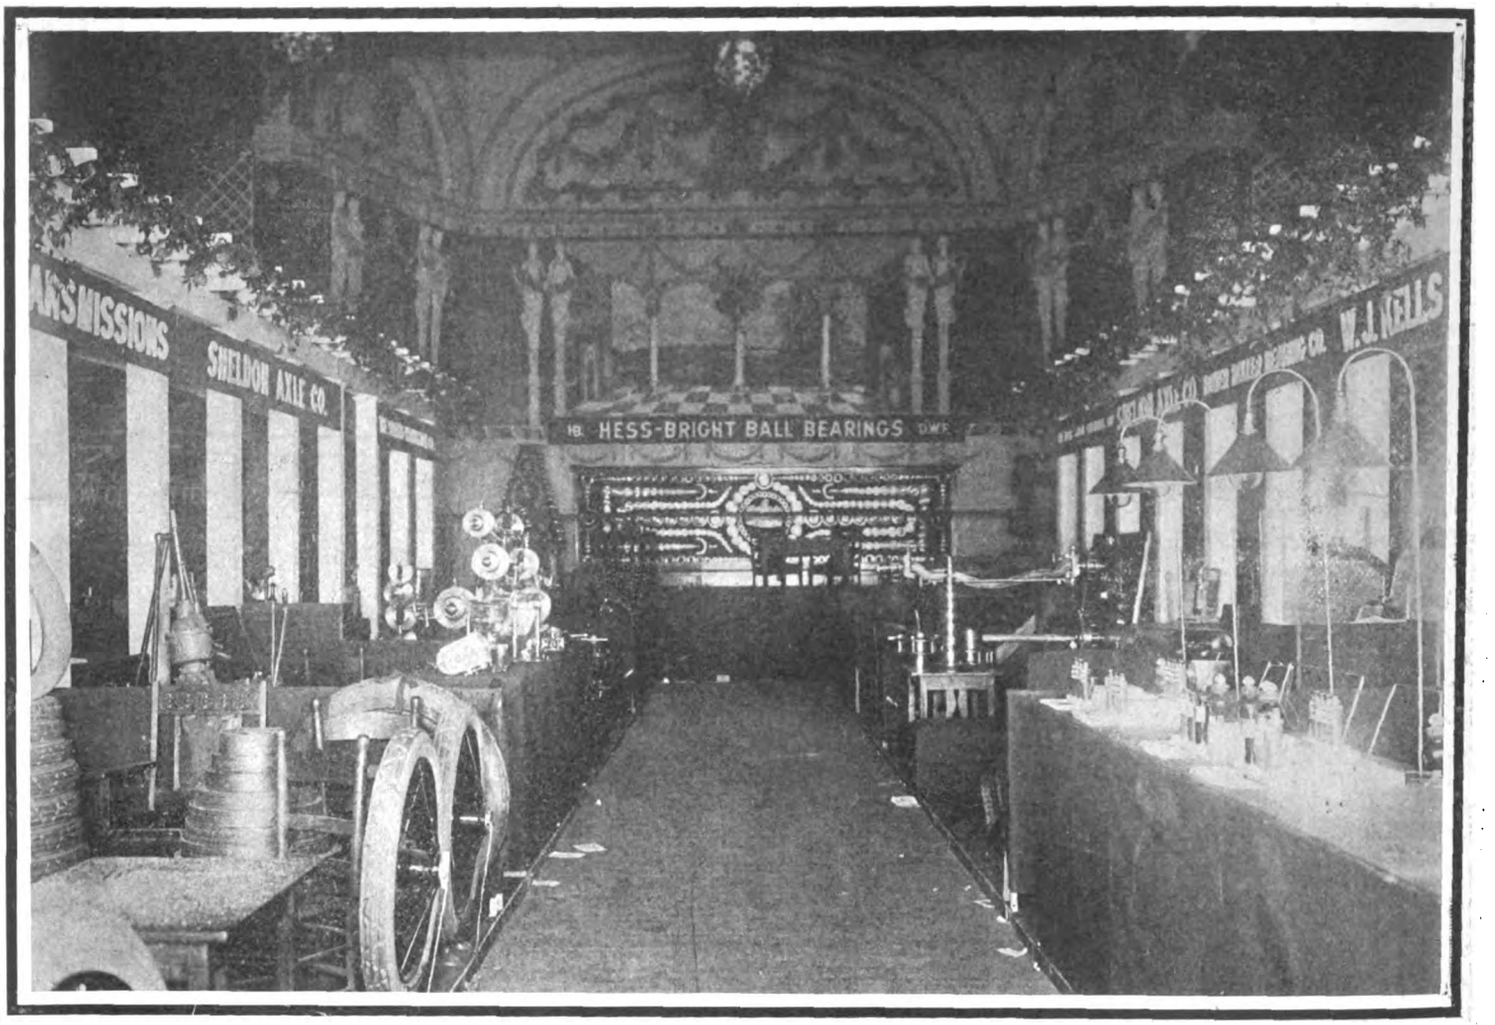
The Vesta generator has undergone a slight change which has to do with the governing mechanism. A ring type governor which operates to close the cutout connecting the generator and the battery when the proper speed has been attained and which serves to insert a single step of resistance in the working circuit when the speed is greater than normal and so cut down the voltage, is provided instead of the ball-governor controlled rheostat which performed both services in the previous instrument. Otherwise the Vesta system is unaltered.

One of the "neat" little fixtures which has to do with the electric lighting system is shown by the Dean Electric Co., and is termed Centurian. The device is nothing more nor less than a relay which is placed in circuit with the tail lamp so that when the filament breaks or the circuit is broken at any other point, causing the rear lamp to go out, the relay closes the circuit to a telltale lamp positioned on the dashboard so that the driver is made cognizant of the fact that the rear lamp is not burning. The device is fitted into a neat case which attaches to the dash of the car and is finished in black enamel.

The General Electric Co. has brought out not a few lighting accessories, chief among which are a new series of sockets which are fully protected from the ingress of dirt and moisture and which fit snugly onto the cable and prevent straining of the wires, a new inspection lamp fitted with a parabolic reflector and a switch in the handle operated simply by rotating the handle, a new three-way switch for use on limousines so that the interior lights can be controlled from the driver's seat as well as from the interior of the car; a new portable combined volt and ammeter providing three scales for reading voltage from 3 to 150 and from .3 to 30 amperes; for use on electric vehicles, a new series of concentrated metal filament lamps has been brought out for use with voltages from 20 to 90.

In the engine starter field but little has appeared that has not been covered fully in preceding issues of Motor World. The Auto-Lite Co., Toledo, Ohio, has altered the relative positions of its units so that the starting motor now is placed with the shaft in a vertical position and operates to start the motor through the timing gear train. Otherwise the system is unaltered.

ELEVATED PLATFORM DISPLAY OF FIRESTONE TIRES AND RIMS, WITH TIMKEN PRODUCTS ADJOINING



Motors.

Of the manufacturers of motors of long standing, but three are showing. The Buda Co. has a new block-cast six-cylinder motor with a bore and stroke of 3¼ and 5½ inches, respectively, known as model SS. In common with other motors of the Buda line, it is of the L-head type with fully enclosed valve mechanism and a self-contained sight-feed oiling system. Provision is made for attaching both motor and generator units of an electric starting system, the former driving through gear teeth provided in a band shrunk on the flywheel and the latter being driven through the timing gears at 1½ times the crankshaft speed.

Two new four-cylinder motors also have been brought out, known as N and T, the former adapted for three-point suspension. Of the newer features incorporated in the design of Buda motors, the combination of Models Q, T, N and O with gearsets in unit power plant form with Buda gears and a cone clutch is probably the most important. Minor details include the provision of gear teeth, shrunk on in band form, on the flywheels, for use in connection with electric statrers, a sight oil feed and the provision of chain drive from the timing gears for operation of the electric generator.

The Northway Motor & Mfg. Co., Detroit, Mich., also has produced a new "six," 4⅛ x 4¼ bore and stroke, with pair-cast cylinders and combined in unit power plant form with a three-speed selectively operated gearset. The motor is of the L-head type with enclosed valve mechanism and silent chain driven camshafts. Cooling is by pump circulation and lubrication by a self-contained system by means of which new oil from the generously proportioned reservoir is forced to each lubrication point

Digitized by Google

CONCERT HALL IN THE GARDEN SHOWING HESS-BRIGHT EXHIBIT ON RAISED PLATFORM IN BACKGROUND

and drained to the base. The oil is not recirculated. Delco lighting, starting and ignition system is furnished with the motor.

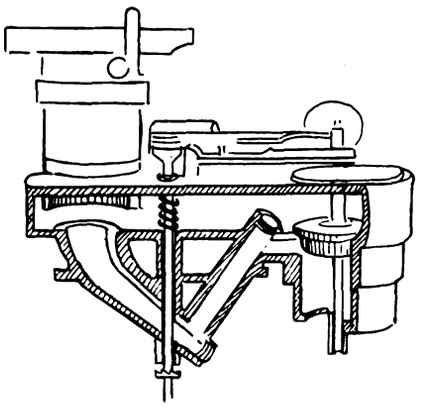
Model 32 is a new four-cylinder motor, in other respects identical with the new "six," excepting only the camshaft drive, which is through helical gears. Save for dimensions, which are 4½ and 5¼ inches, Model 34 is identical with Model 32. Model 33 is a four-cylinder motor of similar general design but lacking the electric system and the gearset; the dimensions are 4⅛ and 4¾ inches. Provision is made for the installation of an electric starter.

Two new motors bearing the Model nameplate are shown by the Model Engine Works, Peru, Ind. One is a "six" with cylinders cast in threes, and is combined in unit power plant form with a four-speed selectively operated gearset of the "overstep" type, giving direct drive on third speed. The bore and stroke stand at 4¼ and 5½ inches, respectively, leaving little doubt as to the aptness of the term "long stroke." Valves are all on the same side and are fully enclosed; three bearings are provided in the camshaft. The other motor is dimensioned at 5½ and 7 inches, bore and stroke, respectively, and is of very heavy ocnstruction throughout, being intended primarily for tractor work.

Besides the Magic motor exhibited by the Aristos Co., New York City, and which has been treated fully in other issues of Motor World, three motors "first time out" are on view, or it might better be said two new motors and a proposed motor, for only a small sectional model and the working drawings of the Oar motor, which is to be made in Plainfield, N. J., by the Oar Motor Co., are on view. The motor is of the piston valve type with the valves operated from yoked eccentrics on the two camshafts which are provided. In themselves the valves are novel in that provision is made for cooling them without coring the valves by having them contact with water cooled surfaces both on the inside and on the outside. Only a single port is provided, through which both ingress and egress of the gases take place.

Also on view is the Lycoming-Mead rotary valve motor, made under the Mead patents by the Lycoming Foundry & Machine Co., Williamsport, Pa. The engine is a "six" with cylinders cast in threes, and differs from the Mead motor as exhibited in connection with the Speedwell car in that the rotary valves are continuous for the six cylinders instead of being divided and joined with an Oldham coupling. The valves are silent chain driven through a reducing gear directly from the crankshaft; chain and gears operate in an oil bath. Gray & Davis motor starting system is supplied with the motor, which is sparked with a Bosch dual magneto. Naturally the motor is water cooled, circulation being induced by a gear pump, and force-feed lubrication obtains.

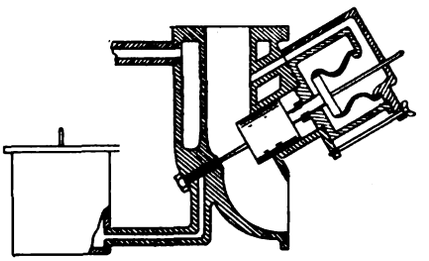
The Twostroke motor, product of the Duplex Gasolene Motor Co., New York City, is radical in design, though not in principle, right up to the point where it might be termed "freakish." Substantially the motor is a two-cycle motor with a separate compression cylinder, and for each revolution of the crankshaft each of the power cylinders delivers an impulse to the shaft, but by reason of the fact that the compression cylinder compresses the mixture straight up to the point at which it is ignited and therefore performs in full the functions of intaking and compressing while the working cylinder performs the functions of expanding and exhausting, the motor is termed "four-cycle" by the maker. One of



Digitized by Google

the interesting points in the design is the presence of single sleeve valves eccentric-operated from the crankshaft in both the compression and the working cylinders. Ignition takes place in a combustion chamber which is distinct from the working cylinder and the hot gases are precipitated into the working cylinder, where they expand, and in so doing perform their function in moving the piston. The motor is water-cooled, and by virtue of the fact that there is no difference in the appearance of the compression and the working cylinders, both being water-jacketed, a two-cylinder motor has the appearance of a four-cylinder machine.

Carburetters.



While at the first glance the problem of proving mathematically that the mixture delivered by a carburetter is constant under all conditions of motor speed and throttle opening, would seem to be a matter incapable of comprehension save by those who are versed in the use of mathematical formulaæ, that such is not the case is aptly shown at the booth of the Motsinger Device Mfg. Co., of Lafayette, Ind., which, as stated in Motor World Before-Shows number, has entered the carburetter field with an instrument that was shrouded in secrecy but which it was promised would make the world "sit up." As finally disclosed, the Motsinger device is best described as a single variable jet instrument, the opening of the jet being controlled by the air inlet valve, which is of such formation—inverted dome—that the quantity of air which passes it is proportional to the lift of the valve, which is to say that if the valve is raised from its seat ¼ of an inch with the passage of a unit quantity of air, when the valve is lifted ½ an inch two volumes of air will be passed. Actuated by the air valve stem is a horizontal lever hinged at one end; a slidable contact which attaches to the needle valve stem rests on the lever. Thus it is easily seen that the lift of the needle valve stem is proportional to the lift of the air valve stem, and since the formation of the needle valve is such that the amount of gasolene delivered through the jet is proportional to the lift of the valve, not the slightest doubt can be expressed as to the constancy of the mixture. For low speeds a bi-pass around the air valve is provided which takes the form of a modified venturi and in this passage the jet is located; so that this passage of air does not interfere with the constancy of the mixture, however, the opening of the needle valve when the air valve is seated, is proportioned to the amount of air passing through the bi-pass.

By way of varying the proportion of gasolene and air to meet all atmospheric conditions as to temperature, barometric reading and humidity, the contact through which the needle valve stem is operated by the horizontal lever can be shifted on the lever so that the needle valve is opened a greater or a less amount for the same movement of the air valve, and a rich or a lean mixture provided and maintained throughout all operative conditions of the motor. This ad-

MOTSINGER CARBURETTER

justment, which is the only adjustment provided, is operated from the steering column through the intermediary of a Bowden wire transmission so that the quality of the mixture can be changed while the car is in operation and the very best results obtained. In other points, the design of carburetter is not so very far removed from the orthodox; the level of the fuel in the float chamber is controlled by a check valve operated by a float of more than ordinarily heavy construction, the bore through which is in the

S U CARBURETTER

shape of a truncated cone, and a butterfly throttle valve is employed.

On the same general type, although the end is obtained in a manner differing not a little bit from the Motsinger practice, is the SU carburetter shown at the stand of the Simms Magneto Co., Bloomfield, N. J., another manufacturer of ignition devices which has taken up the production of carburetters. The SU device, which is of British origin and is being made under exclusive rights in this country, likewise has a single variable jet the opening of which is varied according to the reduced atmospheric pressure above the jet. The needle valve stem attaches to a disk which forms the end of a bellows into which a duct leads from a point in the mixing chamber above the jet; as the atmospheric pressure in the mixing chamber is reduced, the air is exhausted from the bellows, which naturally collapses, lifting the disk and the needle valve, increasing the supply of fuel. Since the atmpospheric pressure is dependent upon the speed of the motor, constancy of mixture is obtained.

Of the very many other carburetters exhibited, the Homo, produced by the Homo Co. of America, Philadelphia, Pa., and the Sunderman, made by the Sunderman Safety Carburetter Co. of Newburgh, N. Y., though neither is new in the strictest interpretation of the term, are novel in that a mixer which is calculated to break up all the particles of liquid fuel before the mixture enters the manifold, is incorporated in the body of the instrument. In the Sunderman device the mixer comprises nothing more complicated than a perforated plate through which the mixture is drawn to the elimination of the globules; in the Homo instrument the mixer takes the form of a perfectly balanced and extremely light fan wheel, the blades and periphery of which are perforated. The motion of the gases through the carburetter sets the fan wheel in motion and the particles of liquid fuel are broken up to the production of a homogenious mixture. In other respects neither of the carburetters is radical.

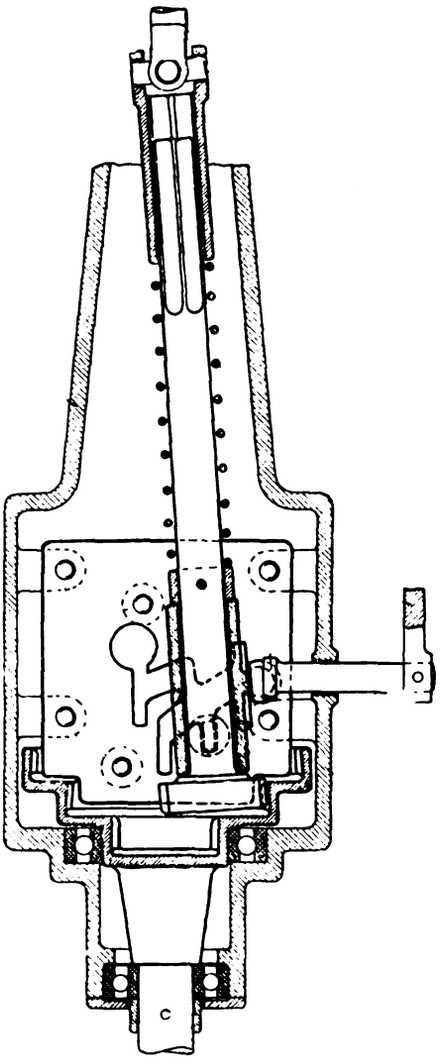
Transmissions.

In addition to the axles enumerated in the Before-Shows number is a development which, while not essentially new in the trade, is new for the American Ball Bearing Co., of Cleveland, O. It is of the worm type and is designed for use in 1-ton trucks, with 50 per cent. overload, and uses Lanchester Daimler annular and ball bearings. Another new product by this company is a pressed steel, bevel drive axle with an inserted driving unit and rear inspection plate. It was brought out to complete a series of three, the building of which the company commenced some time ago.

Two gearsets just developed are displayed by the Muncie Gear Works, of Muncie, Ind., one a four-speed, the other a three-speed, and both selective sliding. A feature of both is that the removal of a plate on the side of the case permits the removal of the reverse gear and the substitution of a new one without the tearing down of the whole mechanism—a desirable device, since the reverse gear is much worked. Control levers are located over the center of the boxes and the gears have teeth of graduated widths, the faces widening by an eighth of an inch each as the sizes increase.

An unusual feature of the mechanism is

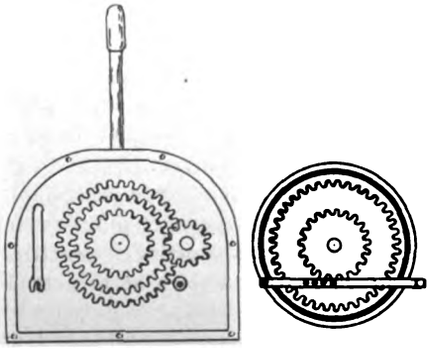
Digitized by Google



that the four-speed transmission may be assembled with direct drive on high or third, and the unit is given a wide range of adaptability in that, while the shift lever is always in the center of the car, the other controls may be arranged for right or left drive. The pedals may be placed at right or left merely by changing the location of the pedal shaft and the brake lever is changeable likewise. The transmission is designed to fit any standard motor.

The clutch is of steel and Raybestos, sections of the Raybestos rings being removed with the object of permitting the clutch to run wet or dry; the operator does not have to worry lest oil leak into the clutch case, neither lest it become dry, as might be the case were the clutch of the wet or dry type. A central spiral spring is contained within the center of the clutch, and when the clutch pedal is pushed a clutch brake tends to stop movement of this part. The company also shows a jackshaft.

Flanking the Magic motor, which is really the Swiss Fisher motor with a new name formed of the initials of the company formed to exploit it in America—Motor and Gear Improvement Co.—and which is distinctive by reason of its sliding crescent valves, there is a brand new gearset that is radically different from anything else of its kind; its appearance with the Magic motor makes plain the meaning of the phrase "gear improvement" in the title of the company which will exploit both, the one having been developed to go with the other.



In its simplest aspect, the Fisher gearset is an arrangement of internal gears in which various speed changes are selectively obtained. The driving gear is connected to the clutch shaft through the intermediary of a universal joint, the other end of the shaft being supported in a ball-bearing mounted shifting block. For high gear, the main driving gear simply is meshed with gearing cut in the center of the driven member, the two then operating as a positive clutch with no gears in operation. The other speeds, first and second, are obtained by progressively bringing the driving gear into mesh with the several internal gear rings in the driven member. For the reverse drive, a small pinion is inserted between the main driving gear and the driven member. The shifting is facilitated by a guide plate housed in the case, which also serves to lock the gears in mesh.

What is hailed as the successor to the type of gearset which incorporates a lay shaft in its makeup, is a four-speed gearset exhibited by J. O. Michaud, of Fort Kent, Me. The device comprises a three-step cone gear which attaches to the clutch shaft and a large internal gear which is designed to mesh in turn with each of the three steps on the cone gear; direct drive, which is on the fourth speed, is obtained by inserting the smaller of the stepped gears in

MAGIC GEARSET

a similarly shaped recess in the back plate of the internal gear. The internal gear naturally is made to shift in a plane parallel with the clutch shaft and in another plane

MICHAUD GEARSET

at right angles with it, so as to mesh with all of the gears, and for this reason the propeller shaft is fitted with a universal and a slip joint; reverse is obtained by the use of an idler pinion.

As for axles, new types and new sizes of older types have been brought out by nearly all of the parts manufacturers who produce axles, but nothing that is startling appeared. The Timken-Detroit Axle Co. has brought out both front and rear axles for use on cars powered between 30 and 35, 40 and 45 and 50 and 60 horsepower, respectively, and two types of worm driven axles for use with pleasure cars weighing up to 3,400 and up to 4,500 pounds, respectively, in which David Brown worms are employed and disposed either under or over the axle, as preferred. In the front axles Timken bearings are supplied in the steering knuckle bearings

The McCue Co. has on view a new rear axle and gearset assembly for use on 1½-ton commercial vehicles, the axle housing being of the well known McCue pressed steel type. Three speeds and reverse are provided by the gearset, which is selectively operated. The Lefevre Arms Co. also has on view a unit rear axle and gearset assembly for use on cars powered between 35 and 40 horsepower; three speeds and reverse are provided.

The Hess Spring & Axle Co. David Brown worm driven axle, for use on pleasure cars, the worm being overhung. Outside of the employment of the worm, the axle is similar to other Hess axles.

Lanchester-Daimler worms finished and fitted with differential gears are on view at the booth of the Warner Gear Co., which also is showing a new gearset in unit power plant form designed to attach to any make of motor and which can be fitted with the Gardner spring starter. The latter attaches to the multiple disk clutch which is fitted tnd turns the motor over upon the release of a stop. The spring is rewound by the inertia of the car. The new gearset, which is designed for four speeds and reverse, selectively operated, is made in three sizes and is designed for center control.

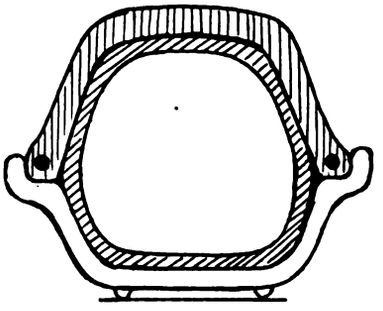
Rims and Wheels.

In the matter of wheel equipment, but little has appeared that was not described in Motor World's Before-Shows number. One new demountable rim cropped up, however, the product of the Presto Inter-Rim Co., of Boston, Mass., which comprises a felloe band provided with a flange at the rear and designed to position the demountable rim which bears the tire, and with a channel at the front end into which fits a split lock ring. The lock ring is provided with two lugs, one on either side of the split, which are gripped and locked firmly in place by a toggle lever lock which attaches to the wheel felloe. The toggle lever is sufficiently long to render the locking operation a very simple matter. A quick-detachable rim made by the National Rim Co., Tarrytown,

Digitized by Google

N. Y., also is shown. It comprises a continuous lock ring which is held in place by lugs caused to protrude through holes in the felloe by flat steel springs to which they are attached. When the lock ring is to be removed the lugs are withdrawn and held out of engagement by slightly turning the springs on the single rivet which holds them to the felloe so that the lugs are out of line with the holes.

Not a little interest attaches to the dual wood wheel which is part of the display of Phineas Jones & So., Newark, N. J., and which comprises two separate felloes and sets of spokes, both mounted on a single hub. The wheel is intended primarily for use on commercial vehicles. Cast steel wheels are very much in evidence and are shown not only by the Sheldon Axle Co., but by the Timken-Detroit Axle Co., Peter Frasse & Co., New York City, who handle the electric furnace products of the George Fischer Co, of Schaffhausen, Switzerland, and by the George Fischer Steel & Iron Works, Ltd., also of Schaffhausen, but a separate concern, whose products are made by the orthodox process and not in the electric furnace. In both cases the spokes of the wheels are cast hollow by way of reducing weight It scarcely would be an exhibit worth the name if the spring wheel were not on hand in one or more of its over 13,000 forms. As made by the American Spring Wheel Co., the Seaton wheel takes the form of an unyieldable rubber tired rim attached to the wheel felloe through the intermediary of helical springs — parallel with the axle—supported by a pair of brackets, one on the felloe and the other on the rim. The brackets alternate on both the rim and felloe, one being placed on the inside and the next on the outside, and the springs are attached through ball and socket joints. Thrust naturally throws the springs at an angle with the axle and all of the springs are slightly distended to bear the load.



Both McCue and Rudge-Whitworth wire wheels are in evidence, the former at the booth of the McCue Co., Buffalo, and the latter by the Standard Roller Bearing Co., which manufactures the wheels for the Geo. W. Houk Co., Philadelphia, Pa. The wheels are fitted with Houk quick-detachable rims. McCue wheels have been altered in that the lacing now is tangent to the hub, by virtue of which a greater resiliency is obtained, and by the fitting of the newer types of McCue rims. A non-demountable wire wheel for use in connection with Ford cars also has been produced by the McCue Co.

Mott wire wheels, or, better, a Mott wire wheel, for the manufacture just has been taken up, is on display at the stand of the Timken-Detroit Axle Co. It is of the radially laced type, and the feature is the simplicity of the demounting mechanism, for the wheel can be detached simply by depressing a push button mounted in the center of the hub. Also displayed at the Timken stand is the Timken cast steel hollow spoke wheel, which is to be made in all of the more common sizes for truck use, and of course the new worms and worm axle.

A brand new addition to the line of Stanweld rims, made by the Standard Welding Co., Cleveland, Ohio, is the rim for use on wire wheels. By virtue of a pair of channels formed in the rim proper, the heads of the spokes are recessed without the necessity for countersinking and the channels, moreover, contribute considerably to the strength and rigidity of the rim. In other respects the rim is similar to the rims used on wood wheels.

Tires.

While all of the many near non-skid treads forcast in the Before-Shows number of Motor World put in an appearance at the show, and also those innovations, the

GOODYEAR-M'NALL TIRE

Overman and Favary tires, and a number of spring wheels, two entirely new and almost radical types of tire cropped out in an unexpected and prominent quarter — in the Goodyear exhibit. They are displayed in the somewhat reluctant manner in which several now prominent articles first made their appearance at shows, the manner indicating caution. The two new Goodyears—the McNall and the Three-Piece Goodyear—are, however, in a more or less experimental stage.

The McNall tire is named after an Akron man who designed it and differs essentially from accepted construction. It consists of two parts, an iron base and a rubber tread. The base consists of a deep channel section, at the upper edges of the sides being a seat to take the edge of the tread. The tread is similar in shape to an ordinary pneumatic tread cut off midway between the rim and the outer circumference of the tire. The beads, which, however, are not held by any clincher device, contain several strands of wire which hold the edges of the tire tightly to the seats, as is shown in the accompanying illustration. A regulation inner tube is used.

The Three-Piece Goodyear tire is all that its designation implies. The first part is the inner tube, which is of regular construction; the second part is practically an ordinary casing minus a tread, and the third part is a tread or tire protector. The tread fits onto the carcass, the carcass fits onto the rim, and the inner tube occupies its regular position. The tread and carcass are not vulcanized together and remain in position through the shape in which they are built; the carcass retains its position as does any casing, and the tread, fitting tightly and snugly about the carcass, is secured by that means. Efficiency and durability were objects in the construction of these types. A feature of the Three-Piece is that when one part—the tread, for instance—is worn out an entire new casing is not required.

A red inner tube has been developed by the United States Tire Co. and is made a feature of its exhibit; added quality, because of the red rubber, is claimed. Among the other tires and supplementary products not ready for announcement in the Before-Shows number but brought out at the show are:

Miller red inner tubes, shown by the Miller Rubber Co., of Akron, O. Red rubber, for which high quality is claimed, is used.

Interlock tires, manufactured by the United & Globe Mfg. Cos., of Trenton, N. J. These have been manufactured for some time for the Australian trade, but only now are being supplied to the home market. They are constructed of crossed duck strips, hand stitched and attached to the bead without the means of wire or metal. It is said that it takes as long to build one Interlock tire as it does to build ten ordinary tires, because of the hand labor, and that therefore the cost is about 25 per cent. greater.

Reason inner tires, displayed by the Perfect Tire Sales Co., of Philadelphia. These consist of a shoe-like inner tire which fits between the tube and the casing and is guaranteed for 15,000 miles. The inner tire, itself, is of two surfaces spaced by rubber block supports; the edges meet at the bottom of the tire, forming a round cavity for a special inner tube which is furnished.

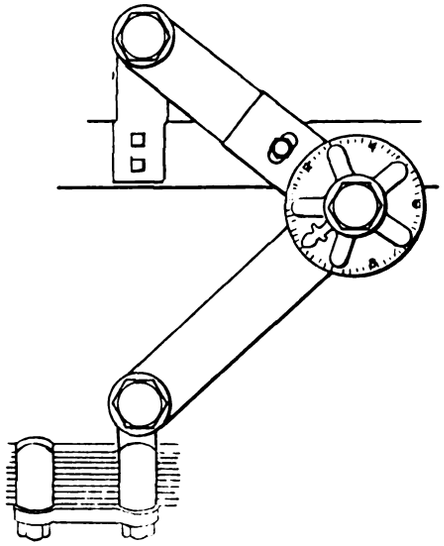
Ignition Devices.

"Newness" in the field of ignition devices is for the better part evidenced in the production of unit spark ignition systems for use in connection with electric lighting and starting systems, making the use of a magneto superfluous. Besides the Atwater Kent Unisparker and the Rhodes Unit Spark systems, which were treated in the Motor World Before-Shows Issue, five "hot off the iron" quick-break systems have made their appearance, of which four—the

Digitized by Google

Briggs, made by the Briggs Magneto Co.; the Duplex, product of the Gould Storage Battery Co.; the Westinghouse, of the Westinghouse Electric & Mfg. Co., and the Esterline, introduced by the Esterline Co.—are integral with the electric lighting systems; the fifth, fathered by the Connecticut Telephone & Electric Co., is put out as a unit for attachment to any lighting system or for use in connection with battery ignition.

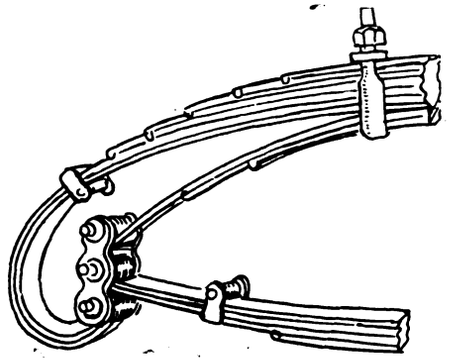
In the matter of magnetos, two new Splitdorf instruments have made their appearance, and, unlike previous Splitdorf instruments, they are of the high-tension type, styled models EU 4 and EU 6, for use in connection with four- and six-cylinder motors, respectively. The instruments are fully enclosed by way of rendering them impervious to water, oil or dust and pockets and corners which are calculated to catch dirt have been eliminated insofar as is possible, to the better and cleaner cut appearance of the devices. Compactness and accessibility are cardinal features, the instruments being no larger than the motorcycle instrument, save only for the distributer blocks. The magnetos are designed to deliver a hot spark at low speeds, and in order to reduce the noise and the wear attendant upon the action of the circuit breaker to minimum, the parts have been made very light.



Outside of the new Herz and Simms instruments, which were treated in Motor World Before-Shows number, nothing save a few minor improvements have been made in magneto products. The National, K-W, Pittsfield, Heinze and Connecticut instruments are exhibited.

A synchronized battery ignition system which embraces the use of a master vibrator through which a spark is delivered to each of the cylinders when the motor first is started, and a quick break for use when the motor is running at speed with a consequent saving in current consumption, is displayed by the Western Electric Co., maker of Pittsfield products.

A new priming spark plug for use with Ford cars is displayed by the Heinze Electric Co., and differs from other priming plugs in that the priming cup itself forms the terminal for the connection of the ignition wire.



Shock Absorbers.

By way of rendering the device equally efficient, whether used on cars with stiff springs or on cars with springs that are very resilient, the Hartford Suspension Co., Jersey City, N. J., has "revised" the Truffault-Hartford shock absorber, of which revision nothing had been said. In its newest aspect the device embraces the use of three frictional arms, one of which is at all times operative and functions when the movement of the springs is but slight. A second and shorter arm is feathered to the longer arm and comes into play, doubling the friction, when the movement of the springs increases, so that the pin on the longer lever reaches the end of the slot in which it works on the second lever. The third arm is provided with a still longer slot and comes into play, trebling the friction when the spring movement is abnormal.

TRUFFAULT-HARTFORD SHOCK ABSORBER

Also new at the Hartford stand is an unheralded rear-end bumper designed for attachment to cars with scroll springs. The device clamps directly onto the scroll and makes use of the resiliency of the car springs, as well as the resiliency of a single leaf spring under the clamp to break the force of blows imparted to the bar.

ANDREW SCOMPENSATING SPRING

Derhion shock absorbers, which are of foreign manufacture, are exhibited by H. A. Elliott, Detroit. In their simplest aspect they comprise a cylinder in which a vane is caused to reciprocate by the action of the spring. A barrier provided with a bypass is placed across the lower portion of the cylinder and fits snugly up against the hub on which the vane is fastened. Mounted loosely on the same shaft and caused to operate by engagement with lugs on the reciprocating vane is a second vane, the blades of which are at a slight angle, so that there is slight lost motion. Both vanes fit up snugly to the cylinder walls at the top of the cylinder, but at the bottom there is sufficient space for the free passage of the glycerine with which the cylinder is filled. In action, the spring is free to move in either direction, until the vane is in such position at the top of the cylinder that passage of the liquid is prevented save through the by-pass, which naturally is slow, and the movement of the spring gradually is checked.

Other shock absorbers, or, better called shock absorbing springs, are on view, the Clarence H. Peacock Co., of New York City, exhibiting Ames springs, designed to be placed over the lower leaf spring and act against its movement; the Huston Multiple Spring Co., which comprises a scroll spring with the leaves of the scroll separated and attached to different shackles attaching at two points to the lower leaf spring, which construction, it is claimed, dampens the recoil, and by the Sheldon Axle Co., which has on display the Andrews compensating device, which is a triple spring, each of the three members being so connected to the shackle that excessive motion is prevented.

Some slight improvements in the shape of a larger casing, the elimination of rivets for attaching the belt and a slightly different shape of compression member have been made in the Gabriel rebound snubber; Connecticut improvements comprise the fitting of an adjustment for changing the tension of the springs for various weight cars.

Lamps.

In lamps there have been a few developments since the Before-Shows number, as follows:

A disappearing lamp for limousine service, perfected but a few days before the opening of the show by C. Cowles & Co., of New Haven, Conn. It consists of a small lamp in a nickeled case, one side of which is open, and which revolves. When the "light" button is pressed the open side turns outward and lamp lights. The "dark" button extinguishes the lamp and causes a neat metal door to fit into the stationary metal frame work which is set into the limousine wall. This company's former disappearing lamps were less attractive and operated with a lever.

A true parabolic reflector shown by the Badger Brass Mfg. Co., of Kenosha, Wis. Highest efficiency is claimed for this reflector because of its mathematically correct shape.

A "Golden Glow" parabolic reflector lamp made by the Esterline Co. of Lafay-

Digitized by Google

ette, Ind., which has a green reflector and throws a soft green light, not hurtful to the eyes; made in 7 to 11 inch sizes.

A headlight deflector made by the Brown Co., of Syracuse, N. Y. This consists of a series of half rings, shaped much like a section of melon rind, and which fold together at the top of the front of the lamp and drop down over the upper part of the front, cutting off half the light.

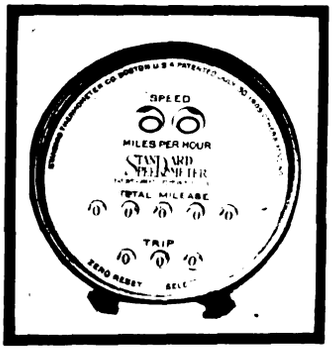
Pumps.

Since the old and the new products in the pump line were heralded in Motor World's Before-Shows Number, new things have come to the surface; the new articles include:

A swinging-arm, hydraulic-pressure pump, made by the Hydraulic Oil Storage & Engineering Co., of New York City; this has an overhead arm eight feet long with eight feet of hose at the outer end permitting the gasolene tanks of cars to be filled within a radius of 16 feet of the upright pipe at the center. Pumping is effected by forcing water, under city pressure, up into the bottom of the gasolene tank beneath the fuel. The two forms of meter are provided, one which may be set to permit the flow of a certain quantity, the other which merely registers whatever flows.

An enclosed sidewalk pump brought out by the American Oil Tank & Pump Co., of Dayton, Ohio, O., which consists of an upright metal pipe passing through the sidewalk and a case at the top in which may be locked the filler hose and pumping mechanism.

A quick-detachable spark plug pump shown by the Brown Co., of Syracuse, N. Y. With each pump is furnished a two-piece spark plug, the base screwing into the plug hole as usual but the remainder of the plug being removable by a partial turn. It is held in place by pins and slots. By removing the removable part of the plug the pump can be inserted in its place.



The Goodyear Tire & Rubber Co. is marketing the Folberth power tire pump; the pump is screwed into a hole drilled in a plug in the cylinder head and power is furnished by the piston rod of the pump, which projects into the cylinder and rests upon the piston head of the motor. The operation of the motor works the pump.

Tops.

The tops of which the features were described in the Before-Shows number have been increased in number by one, made by the Pantasote Co., of New York City. It is of the quick-collapsible, one-man type; the breaking of elbow braces in front of each front bow, and near the top, causes all other joints along the sides to break, and the top may be pushed back and folded by one man. Of bows there are but three on a side, one in front and two at the rear. Before breaking the braces, however, the operator is required to loosen the lower ends of the front bows. This is accomplished by unscrewing a screw with a winged nut head which, on each bow, is toward the front seat, where it easily can be reached. The feature of this screw is that it cannot fall out of the bow and is ready in place when it is desired to attach the front bow in its resting place at the base of the rear bows.

Speedometers.

Unannounced and out of the ordinary, yet in full keeping with the recent progressive policy of the manufacturer, whereby the whole line of instruments was revised and considerably improved and increased,

STANDARD DOUBLE READING METER

are the Hoffacker speedometers with ornamental dials. The instruments are combination models—Waltham timepieces—on which the dial frames have been made hexagonal, in one case, and slightly more ornate in another, and with pleasing effect. Metal work in both cases is blackened.

Not ready at the time of the Before-Shows number was a double-reading speed scale exhibited by the Standard Thermometer Co., of Philadelhia, Pa. Features of this, which has been used in certain forms on mileage registering devices, are a zero reset and selective set. The former is a button at the bottom and left of the face which turns the numbers of the trip mileage back to zero, when the gears attached to the button are thrown out of mesh and the reading does not go back of zero; in some instruments the gears remain in mesh and the figures turn backward to 99.9 and downward.

The selective re-set is utilized when a driver, who is traveling with a road book and map, desires to have his trip meter register with the mile posts; a few turns of the button suffice to set the mileage with the reading on any milepost, after which the trip reading should correspond with the book. The speed is indicated by a pair of figures in holes in the upper half of the face; the total mileage reading is up to 100,000.

Bearings and Metals.

Since the Before-Shows issue several manufacturers have brought to light improvements in their products, as follows:

Barthel, Daly & Miller, of New York City, importers of Schafer bearings, who exhibit a self-aligning bearing designed to allow for irregular running of the borne part.

Rhineland Machine Works, of New York City, which has a bearing the construction of which allows for deviation in a shaft, especially a long hung shaft of a garage or machine shop. It consists of an inner race, balls, an outer race, the outer surface of which is a section of a sphere and an outer ring whose inner surface is a section of a hollow sphere fitting the outer surface of the outer race.

The Merchant & Evans Co., of Philadelphia, Pa., which has compounded what it terms an S. A. E. phosphor bronze bearing metal. Also several parts in the company's clutch have been made of pressed steel, thereby eliminating weight and increasing compactness. A new product is an alignment joint, which allows for a total of 8 degrees and is suitable for work in close spaces.

The A. C. Smith Co. of Milwaukee, Wis., which has commenced to manufacture the Whitney roller bearing, of the adjustable tapered cup and cone type.

Frank Mossberg & Co., Attleboro, Mass., line of socket wrenches, feature of which is lightness. Also have a ratchet handle which has a long guarantee against breakage.

Allen Wrench & Tool Co., of Providence, R. I. Line of socket wrenches in which ratchet is replaced by handle in which end of handle binds against turning part of wrench and grips through friction, eliminating pawl and teeth. The Allen friction drill is similar in operation.

Locks.

The list of safety devices in the Before-Shows Issue has been augmented by several additions, among which are two combination locks. The additions are:

A knob combination lock displayed by the Ajax Trunk & Sample Case Co., of New York City, consisting of an ordinary type of safe lock attached to a dust and waterproof trunk; necessity of keys is eliminated.

A similar lock on tool boxes made by the Globe Machine & Stamping Co., of Cleveland, O. Two new boxes have been designed for Ford cards.

The "Slyco" tire holder and lock, manufactured by the Sly Mfg. Co., of Cleveland, O., and shown by Smalley Daniels of Detroit, Mich. The tire is locked into a metal

Digitized by Google

holder by a hasp and snap lock and is removed only when a key is used.

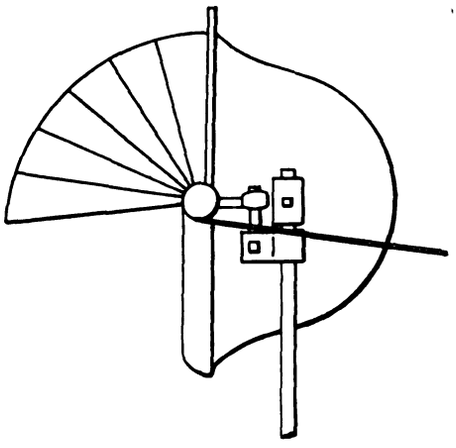
Another Sly product, known as the "Slyco" car lock, consisting of a door to a case containing the ignition dash switch plug, a lock on the door and a key. When the plug is removed and the door locked ignition cannot be effected.

Horns.

Horns, of which the Before-Shows Issue described the Klaxon, Tuto, Rexo, Newtone, Long, Jericho, Jubilee, Monoplex, Riley-Klotz, Gabriel and Nonpareil types, have been supplemented by three others. They are:

Electra, shown by the Automobile Supply Mfg. Co., of Brooklyn, N. Y. Of the vibrator type and operates on one-half ampere. Price $4.

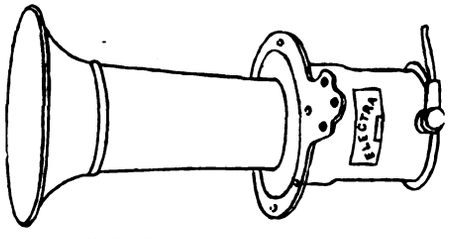
Sparton, displayed by the Sparks-Withington Co. of Jackson, Mich. Of the motor type, in two models. Also a combination motor and reed type.



Clero, exhibited by the Fitzgerald Mfg. Co., of Torrington, Conn. Of the vibrator type, hammer tapping against a steel diaphragm.

New Accessories which Cropped up.

Pyrene fire extinguisher carrying bracket, for automobile dashboard use, made by the Pyrene Mfg. Co., of New York City. Instead of lifting the extinguisher upward and so out of the retaining bracket, it is held at the top by a spring clamp and at the bottom by a concaved cup which permits the extinguisher to be removed by a pull at right angles to the dash. The extinguisher also now is made in a two-piece shell.



A ventilator, exhibited by Charles Cowles [illegible] both demonstrated by the International Metal Polish Co., of New York City. The former is an internally applied cement.

New designs in mirrorscopes, tire holders, pedals and gauges by the Emil Grossman Co., of New York City.

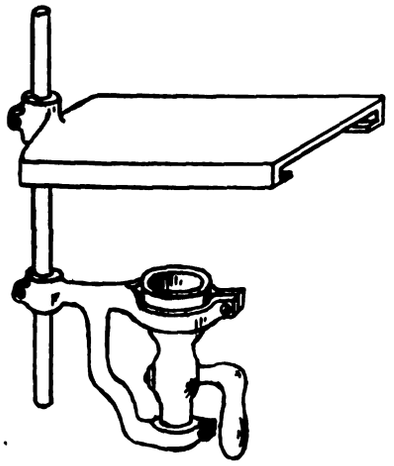
B'CO RAY DEFLECTOR

The Neal shovel, manufactured by the B. B. Neal Hardware Co. of New York City and displayed by the Perfecto Wind Deflector Co., which may be taken apart and stored in the tool box until needed to shovel snow, sand or any other impeding substance. Its overall length is 29 inches three holes through which the rope is passed and made to hold itself in a loop by an end tucked under the rope between two holes.

ELECTRA SIGNAL HORN

Turner hot-blast torch, exhibited by the Turner Brass Works, of Sycamore, Ill. An improved construction of an under-generator burner produces a hot flame and affords efficiency under extremes of weather. The torch is equipped with an improved automatic check valve. Made in quart and pint sizes. The Turner Tubular Torch operates like an ordinary gasolene blow torch but is capable of producing more heat. It is of 2-inch brass tubing five feet long and has a capacity for three quarts.

Spring leaf lubricaotr, exhibited by Chas. E. Miller of New York City. This is a small tool which is attachable to any leaf spring, forcing the leaves apart for the purpose of lubrication.



Of the very many bumpers which are on view, probably none is more interesting than the Improved Universal, produced by the Polson Mfg. Co., Buffalo, N. Y., in the design of which the use of a double bar is distinctly new. The device is of the clamp-on type designed to fit most of the cars on the market and embraces the use of helical springs enclosed in telescoping tubes. Exhibited by the same manufacturer is a windshield designed for use on roadsters. The lower edge of the bottom glass—it is a rain-vision shield—is cut to fit the curve of the dash, eliminating the filler board as ordinarily supplied. In other respects the shield is very similar to the well-known Polson line.

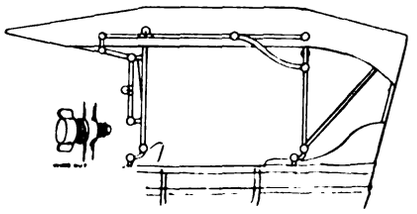
Among the other new devices which have cropped out is the Rich Tungsten valve, product of the Rich Tool Co., Chicago, Ill., which, as the name would imply, is formed

Digitized by Google

dle through the intermediary of a universal joint, so that the handle can be held at any angle. A novelty is the extension base which permits the height of the base to be increased by four inches and the crown wheel clutch by means of which the worm attaches to the pinion and which permits the jack to be raised or lowered without resorting to the use of the handle.

For testing the quality of lubricating oil, as well as for determining if the correct amounts are being supplied to the cylinders, a neat little device has been brought out by the Texas Oil Co. It embraces the use of a bracket designed to hold a card over the opening in a pet cock which enters the cylinder. The bracket is adjustable for varying the distance between the card and the orifice. The quantity as well as the quality of oil can be judged by the imprint on the card after the petcock has been opened with

TEXACO OIL TESTER

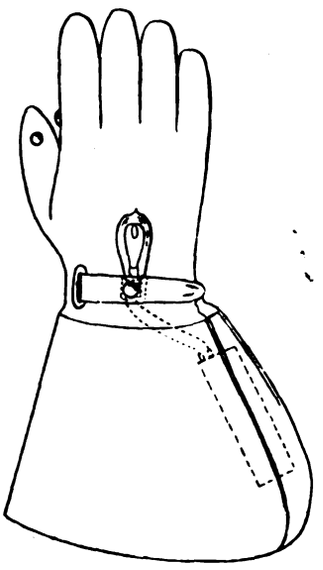


the motor in operation, after a little experience on the part of the operator.

Instruments for testing and recording the temperature of the furnaces used in the heat treatment of steel are shown in a variety of forms by the Leeds & Northrop Co., Philadelphia, Pa.

Although a multitude of dial and pencil tire gauges were listed in the Before-Shows Issue, a new one was shown; the maker is the Improved Gauge Mfg. Co., of Syracuse, N. Y., and the gauge claims as its feature that while it is of the dial type it retails at $1.

Every show serves to bring out certain articles which attract attention because of their difference and peculiarity, and some survive and become factors in the trade, while others are never seen again. Since the Before-Shows number several such have appeared, and among them are:



An automatic signal for chauffeurs and passengers, exploited by Charles A. Schindler, of West Hoboken, N. J. The signal device consists of a small red lamp attached to the back of a glove with a small battery in the lower side of the gauntlet; touching the thumb and forefinger brings two copper buttons into contact and the light lights, the chauffeur at the same time extending his hand out from the side of the car to warn following drivers of a turn or stop. In daylight a glove is used on which a small bell takes the place of the lamp. Prices range from $6 to $30 per pair.

PANTASOTE "ONE-MAN" TOP

The glove may be connected with a battery in the car, and the device is also recommended by the makers to those passengers who are in the habit of assisting the chauffeur in signaling cars which are following.

A headlight glare remover, demonstrated by William L. Tobey, of East Boston, Mass.

SCHENDLER SIGNAL GLOVE

This consists of a disk of amber-colored glass, about five inches in diameter, attached to a clamp and supporting rod which attach to the top or side of the windshield or some other part of the car. The device is adjustable to suit the driver and comes into play when the glare of approaching headlights tends to blind the driver, he shifting the position of his head so that the disk is between the lights and his eyes.

A "Button Bulb" for operating either an electric or reed horn, or both, manufactured by the Riley-Klotz Mfg. Co., of Newark, N. J. This consists of a button set into the top of a horn bulb, electrical contacts inside the bulb, wires running to the electric horn and an air tube to the reed horn. Pressing the button on the top of the bulb operates the electric horn, squeezing the bulb blows the reed horn.

WELCOME THE TRUCK; SPEED THE PLEASURE CAR

Trucks Will Be Less Spectacular, but Will Not Lack Interest Because of the Fact—Comparisons, Which Are Not Odious, Show Strong Tendency Toward Standardization—Improvements That Will Be Disclosed.

It is possible—it is, in fact, extremely probable—that the crowds that will invade Madison Square Garden and Grand Central Palace next week will not be so large as those which have pressed the salesmen against their cars during the present week, and that there will be a smaller proportion of wearers of fashionable apparel—especially of the feminine variety. But—and it is a "but" of extremely large dimensions—it is likely to be the kind of a crowd the dealers like—an interested crowd—a "buying" crowd. For when Part I—pleasure cars—moves out on Saturday night, its place will be taken by Part II, which denomination covers the grimmer instruments of commerce that go under the general designation of commercial motor vehicles—delivery wagons (light and heavy), motor wagons, trucks, tractors, and all the various and multifarious members of the big family, and there are not many who go to see them as a mere spectacle. They are far less decorative than pleasure cars, and there is a total lack of the glamor that adds to the magnetism of the lighter, swifter and more ornate cars, and those who go to the truck show usually have some good reason for doing so—and the reasons usually can be traced to a financial root.

And while the dealers are only too delighted to welcome those who are possible future purchasers—to say nothing of those who are merely interested—it may be said with entire sincerity that the dealers are prepared to treat purchasers better than at any previous shows. There has been little or no tendency during the past year to go shooting off at a tangent with fantastic designs; rather, the more conservative and familiar things have been adhered to and improved, and at the same time manufacturing methods have been refined and made less expensive, so that in many cases—in fact, in most cases—the buyers of trucks get more actual value for their money than has been possible heretofore.

For those who are genuinely interested, either as users or from a mechanical point of view only, there will be a good deal that will be well worth inspecting, notwithstanding the fact that commercial vehicles are gradually approaching a more or less uniform set of types, so to speak, and exhibit fewer radical differences than in the past. For instance, there will be several worm-driven machines covering a wide range of capacities, from the Smith-Milwaukee six-tonner and the Pierce-Arrow five-tonner down to the light types, which will include a brand new, popularly priced Gramm. Rowe, Universal, Blair and Schacht will show worm driving systems worked out for commercial service. The La France, with the Manly hydraulic drive, will be a center of interest, even though it is not exactly brand new.

The number of trucks that have settled down to a standard of construction and do not vary it appreciably is distinctly on the increase. White, Alco, Garford, Peerless, Packard, Pierce, Reo, Buick, Velie, Mack, Saurer, Hewitt, Knox and all the noble army of electrics are in the forms in which they have already been made familiar, though it goes without saying that there are numerous changes and improvements that experience has suggested. Even new machines, appearing for the first time, step at once into some one of the standard classes, for the time has passed when every man dreamed himself a fearful and wonderful machine, built it—and then started on the thorny—under the circumstances—path to the knowledge of how a truck ought to be constructed.

It goes without saying that there will be a few unexpected things brought out at the double show; there never was a show that did not develop something of the kind, whether good, bad or indifferent. But it is pretty safe to venture the guess that they will be practicalities and not of "the stuff that dreams are made on." It is just possible that there may be a few surprises in the way of motor starters; there seems no good reason why commercial vehicles should not be equipped with these conveniences, and the mere fact that manufacturers have been rather reticent on the subject may presage the appearance of a few at the show. It is a certainty, however, that there will be a great many left-steered machines with center control or without, and also that the good work that already has been done by governors will be reflected in the fitting of these money-savers to a large proportion of the cars exhibited.

Of the electric squad, it may be said that they long ago ceased to make changes in anything except details. All are of standardized designs and the principles involved have been tried out and tested in every possible way—and this applies as well to the old timers and to the new comer, the Atlantic. Better motors, better batteries and better bearings and moving parts generally have brought about better service in every way. The reliability of the electric is one of its strongest points.

A truck that is so young that it really has not been born to commercial existence is the Croce, for the manufacture of which a factory is in process of construction at Asbury Park, N. Y. The first machine was built in a machine shop and was the seed from which first a company and then a factory grew. The car is expected to show some feature of more than usual interest.

In the heavy truck field the possibilities that lie in the tractor principle have been given no little consideration, and there will be special machines designed as tractors or semi-tractors, in which class the new Baker

Digitized by Google

electric is prominent—a short, stocky, powerful machine intended for hauling.

There will be several exhibitors in the accessories class who were not in evidence at the pleasure car shows. These are as follows: American Kushion Kore Tire Co., New York City, tire filler; Wm. H. Brown, Cleveland, Ohio; Eureka Non-Skid Mfg. Co., Brooklyn, N. Y., anti-skidding devices; Federal Chain & Mfg. Co., Springfield, Mass., Federal and Gaylor non-skidding devices; Never Skid Mfg. Co., New York City, anti-skidding devices; Pioneer Steel & Block Tire Co., St. Louis, Mo., Pioneer tires; Polack Tire Co., New York City, Polack tires.

Summary of Trucks To Be Displayed.

You Can Look a Man in the Eye When You Sell the National

You don't have to exaggerate

It is the path of least resistance to sell National cars because of their apparent and demonstrated qualities. Glance at these few features—can you beat them on any other cars, for the price?

Long stroke (4⅞ x 6) flexible and noiseless Motor with enclosed valves.
Left side drive.
Center control.
Gray & Davis Electric Starter.
Gray & Davis Dynamo Electric Lighting System.
Bosch double dual Magneto.
12-inch Turkish Upholstery.
Full heavy nickel Trimmings.
Multiple jet Carburetor.
Electric Horn.
Adequate baggage carrying Compartment concealed in body but easily accessible.
Powerful and reliable Brakes.
Tire Pump, integral part of the motor.
128-inch wheel base.
Adjustable ventilating and rain vision Wind Shield.
Hoffecker Speedometer.
Tire Carrier in rear.
Silk Mohair Top, Cover and Curtains.
Full floating Rear Axle.
Resilient Springs, ¾ elliptic in rear.
Large gasoline pressure-feed Tank in rear with Gauge.
Plain, continuous, enclosed Metal Guards.
The only perfect Oiling System.
Truffault-Hartford Shock Absorbers on rear.
One extra Firestone demountable rim.

If We Can Prove This, Are You Interested?

We say that the National is superior to any other car in actual worth that sells for the same price—we go further and say that we give you as much service and quality as any $5000 car.

We say that money can not buy better materials than used in the National—that the National has the most flexible motor—the most perfect oiling system—the greatest degree of luxurious upholstery and comfort—and we say that the National is a money-making car for dealers because of its merits and reputation. Don't you think you should at least investigate our claims?

LEGISLATION PLANNED TO REDUCE DRIVING HAZARDS

Connecticut Association to Present Three Traffic Regulations to Legislature—Nearly All Old Officers Re-elected.

That the Connecticut Automobile Association is nothing if not alive to the interests of its members was evidenced at the last meeting of the Executive Board, which was held at the headquarters of the Hartford Automobile Club on Monday, when no less than three bills, calculated to reduce the hazard of driving, were drawn up for presentation in the General Assembly under the sponsorship of the association. At the same time, a vote was passed recommending that a single State tax be substituted for the triple taxation now imposed by the State, the county and the borough or city.

The first of the bills provides that all vehicles must carry lights; the second provides that the drivers of horse-drawn vehicles must not have their view to the back and the sides obstructed by their loads; and the third provides for the trimming of trees and shrubs at intersections of roads and at curves where thick foliage prevents a clear view of traffic.

At the election which preceded the transaction of business, the old board of officers was re-elected, with scarcely a change, the list being as follows: F. T. Staples (Bridgeport), president; John N. Brooks (Torrington), vice-president; C. N. Robinson (New Haven), secretary; Fred C. Howe (New Haven), treasurer. In the board of directors, R. P. Lewis takes the place of E. J. Daly in the Waterbury district; in the Hartford district, Arthur Fifoot and F. Spencer Goodwin were added, and in New Haven the new representation consists of Philip Bond, Adolph Mendall, Frank Mason and George Coan; the Danbury district this year is represented by E. N. Bailey and the New London district by R. H. Bonds, Jr.; Norwalk and Rockville are represented by Dr. D. W. McFarlane and W. H. Robinson, respectively.

More "Outrages" by Contest Board.

At its meeting in New York on Friday last, 10th inst., the A. A. A. contest board committed more of those "outrages" which caused 20-odd Los Angeles men to hurl defiance and constitute themselves the Western Automobile Association, which is to say that Teddy Tetzlaff, who participated in an unsanctioned racemeet held in San Fernando, Cal., on November 28th last, was given an opportunity to cool his heels until May 28th next. Tetzlaff's suspension was automatic, of course, but the A. A. A. action makes it cover a definite period. The ban has been made to cover E. E. Hewlett, whose Fiat car Tetzlaff drove; Hewlett's suspension is for a similar period. Ralph C. Hamlin, who drove the winning Franklin in the 1912 Los Angeles-Phoenix desert race, was disqualified and suspended until April 1st for advertising the car as a "regular stock car," despite the fact that the race was run as a non-stock free-for-all event.

Roman Wins $100 for Anti-Bulb Letter.

The first prize of $100, which was offered by the Lovell-McConnell Mfg. Co., of Newark, N. J., for the best letter telling why the bulb horn should be discontinued as the "customary" signal in the equipment of the modern automobile, has been awarded to F. A. Sears of Rome, N. Y., whose letter, in the opinion of the board of judges, was the best of the 700 received and considered. The second prize of $50 was awarded to Dr. A. C. Smith of Elberton, Ga., and the 10 prizes of $10 each for the 10 next best letters have been sent to Wm. E. Joyce, of Detroit, Mich.; James A. Burke, of Bridgeport, Conn.; C. M. Siever, of Holton, Kan.; Elmer Eby, of Lititz, Pa.; D. D. Truesdale, of Bunker Hill, Ill.; A. Reis Meyer, of Cincinnati, O.; G. W. Putnam, of Yorkeville, Ill.; Connover & Robinson, of New York City; Harold A. Barber, of Detroit, Mich.; and Herbert V. Burland, of New York City. Not all of the letters received for consideration were penned by motorists or those connected with the trade, and as a result the reasons given why the bulb horn should be retired in favor of a more adequate signal were many and varied.

A. A. A. Denies Reinstatement of Staver.

Although it was hoped that the suspension of the Staver Carriage Co., of Chicago, Ill., would be lifted at the last meeting of the Contest Board of the American Automobile Association, the hope came to naught, for the company's application was considered and denied. The Staver company was disqualified and suspended until June 1st, 1913, on October 21st last, for advertising the Staver-Chicago car driven in the "Around Lake Michigan" tour as a stock car in violation of Rule 75 of the A. A. A.; the tour was a Grade III non-stock run.

At the annual election of the Yonkers (N. Y.) Automobile Club, John J. Walsh was elected president, William A. Allen vice-president, Ernest N. Cokefair secretary, Charles F. May treasurer. The board of governers comprises the officers and Dr. G. Byron Brown, William E. Miller, Dr. A. Newell Benedict, William E. Yerkes.

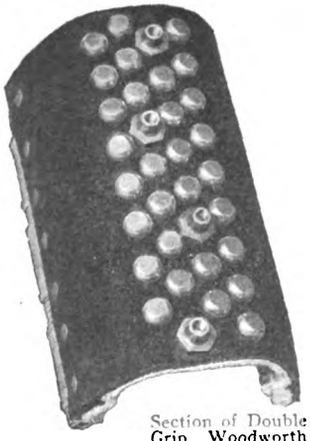
UNSANCTIONED MEET MAKES OLDFIELD AN OUTLAW AGAIN

Forgets Promise to "Be Good" and Competes at "Local Interpreters'" First Meet—Teddy Tetzlaff Also Goes Over.

Despite his promise to "be good" when reinstated last year by the contest board of the A. A. A. on May 1st last, Barney Oldfield is again in the "outlaw" class, having participated in a two-day race meet—unsanctioned by the A. A. A. but run under auspices of the "outlaw" Western Automobile Association—which was run on the Los Angeles Motordrome track Saturday and Sunday last, January 11th and 12th. Tetzlaff, who was already under the ban of the A. A. A. for participating in an unsanctioned meet, also participated, as did George Hill, who won the recent San Diego road race and who, with Kincaid and Du Casse and several lesser lights, share the fate of Oldfield. To the latter, however, who has recently entered the liquor business in Los Angeles and announced his intention to withdraw from the ranks of the profession racing drivers, the suspension is a matter of slight import.

Saturday's program comprised the first heat of a three-heat match race between Oldfield (Christie) and Tetzlaff (Fiat), which went for a single mile and was won by the former in 36⅕ seconds; a five-mile match race between George Joermann (Maxwell) and Kincaide (Studebaker), which was won by Joermann; a five-mile free-for-all, which went to Magaun (Fiat), and a five-mile free-for-all handicap, won by George Hill (Fiat). On the second day Tetzlaff reciprocated and took the final two heats from Oldfield. The remainder of the program comprised a five-mile race for light cars, won by F. Goode (Studebaker), a five-mile contest for heavy cars, won by Magaun (Fiat), and a five-mile free-for-all, which went to Joermann (Maxwell).

Savannah Sets Dates for "Classics."



If things go according to the program as laid out by the Savannah Automobile Club, but two days will intervene between the running of the Vanderbilt and the Grand Prize road races, November 25th and 27th having been chosen as tentative dates. The Grand Prize race will be run first, carrying out the idea of making it a curtain raiser for the Vanderbilt contest, as was to have been done at Milwaukee last year, had not bad weather and a worse course caused a reversal in the order of things. Naturally the carrying out of the schedule depends upon the action of the two contest boards.

DON'T DO IT

Digitized by Google

Section of Double Grip Woodworth Treads showing hardened high rivets.

Don't Throw Away This Added Business!

Do you realize that tire troubles are keeping many of your possible customers from buying cars? That many present customers—doctors, business men, and women drivers—are using their cars less than they would if it were not for the puncture bugbear?

Punctures—blowouts due to fabric rotting and the tedious fussing to keep tubes and casings in repair—these things are spoiling good business for you every day in the year. Eliminate them, and you will not only make a profit on the immediate sales, but will secure a large increase in general business as well.

Woodworth Treads

absolutely prevent punctures an droad damage to tires. They are a perfect non-skid in mud, snow, or ice. They save the time spent in patching cuts and blisters. They are readily applied or removed, yet **they cannot loosen or chafe the tires.**

Woodworth Treads Are Different

from other tire coverings. They are held tight by stiff patented-coil springs running around each side. They are thin, light and flexible—like a glove—because it is not necessary to make them excessively thick to resist stretching, as with rim-fastened coverings. Any stretch is taken up by the springs. The Tread hugs the tire like an elastic band, and simply stays on the job till it wears out.

We Guarantee Woodworth Treads

in the broadest manner as to service and freedom from damage to tires, and we will make good liberally on any failure in either respect. We support dealers in selling on 30-day trial, and we allow full credit on goods ordered but not sold.

To prove our statement, we will send any rated dealer a pair of Treads for his emergency or rental car on 30-day trial. Send no money! If on thorough trial you do not like the Treads well enough to use them for their time-saving value to you, return them and we will cancel the bill.

We have a bunch of dealer helps, too:—a full-sized lithographed metal reproduction of the Tread, sample sections showing the construction, and all needed literature. But a trial is the best proof! Write today: send your rear tire sizes and say "Show me!"

Elyria-Dean

Elyria-Dean Magneto--A Better Kind Than You Have Known

The new Elyria-Dean ignition system gives a kind of service to the car owner unknown with any other system. The Elyria-Dean magneto employs high frequency, high tension, electrical discharges, instead of the ordinary high tension discharges used in other ignition systems.

This high frequency spark gives a new life and energy to the ignition, a feature much sought after by the intelligent car purchaser or owner.

It ignites the gas instantly, even with poor mixtures and gives complete and rapid combustion of large volumes. This means more power from your motor; it means quicker and more reliable power and a satisfaction that comes only with the best kind of ignition.

With the Elyria-Dean ignition system, wider spark plug gaps are permissible than with other systems and the disruptive action of the spark prevents fouling of the plugs. Ordinarily, plugs never have to be removed, except for mechanical breakage.

High cylinder pressures have less effect on this spark than on other ignition sparks.

"Self starters" are made successful on magneto ignition as effective sparks are obtained at very low speeds, below 50 R. P. M.

No missing of the motor with the Elyria-Dean, even at the lowest speeds. All wiring carries low voltage currents, as the little resonator coils at the plugs step-up the pressure just where it is used. This obviates leakages and the maintaining of high insulation in the magneto, switch and connecting wiring.

The exclusive manufacturing license has been granted us under the Seeley patents and pending applications, giving us the legal rights and only practical methods of applying high frequency currents to automobile ignition.

REXO HORN
Electric Warning Signal
GUARANTEED

A "Standard Equipment Horn"

We have already sold over 65,000 Rexo Horns for 1913 cars. When you see a REXO on a car it means that the maker of that car is willing to hitch up his car's reputation with REXO reputation and take our word for it.

45,000 REXO Electric Horns of special design are specified by one car maker, the largest electric horn order ever placed.

The Electric Warning Signal will be standard equipment on practically every automobile marketed in 1913, and most of the earlier models will be brought up to date by the installation of an efficient electric horn by the car owners. We know this to be a fact for our mammoth sales of the Rexo, Tuto and Tuto-Ette Electric Horns to automobile manufacturers and jobbers is the most conclusive evidence.

Rexo Features

The sound of the REXO is loud, abrupt, clear and unlike the motor driven horn; it is instantly responsive.

The standard REXO horn is designed to operate from any 6-volt battery and the current required is never over 1.8 amperes. The REXO does not contain any moving parts which require tri-weekly lubrication, monthly overhauling, washing in gasoline, greasing, etc., nor is there any danger in clogging from dust or moisture. The operation is equally as positive in winter as in summer, as there is no oil or grease to congeal, etc.

The REXO requires no care or attention during the full season of running and only a very slight adjustment is necessary to overcome a full season's wear, and this can be done in a few minutes and with an ordinary screw driver, as there are no delicate parts which can be damaged.

Rexo Horn—complete with button and cord, $8.

At the New York Shows

REXO Horns and other Elyria-Dean products will be exhibited in space 305, Concert Hall, Madison Square Garden, and in Space 225, Balcony, Grand Central Palace.

Elyria-Dean

Elyria-Dean Speedometer

Simple and Always Accurate

The Elyria-Dean Speedometer has the most modern features of any speed measuring device on the market.

It has real speedometer value, easy reading, steady hand, permanent accuracy, lasting strength, neat design and handsome finish.

The dial is black with white markings; the case is beautifully finished in baked black enamel with nickel trimmings.

The hand is steady and shows the speed at a glance by its position. No need of laboriously deciphering the figures or markings as in other speedometers.

The cup is shaped so that a long scale of uniform division is obtained direct. No need to guess at the reading or doctor the scale.

The Odometer—Geneva type—is exceptionally reliable. Trip scale reset to the tenth mile, which facilitates following guide book markings.

It always adds mileage whether the car goes forward or backward, or whether shaft is driven from right or left hand wheel.

The Elyria-Dean Speedometer operates on the unvarying principle of direct centrifugal force. No compensating gears, springs or other parts to hamper or reduce accuracy.

The accuracy is unaffected by weather conditions. It registers the same in winter and in summer, in rain or in shine. No regulation or compensation required.

This elegant instrument is the proper equipment for the highest-priced and most luxurious motor cars. See it and other Elyria-Dean Products at the New York Shows.

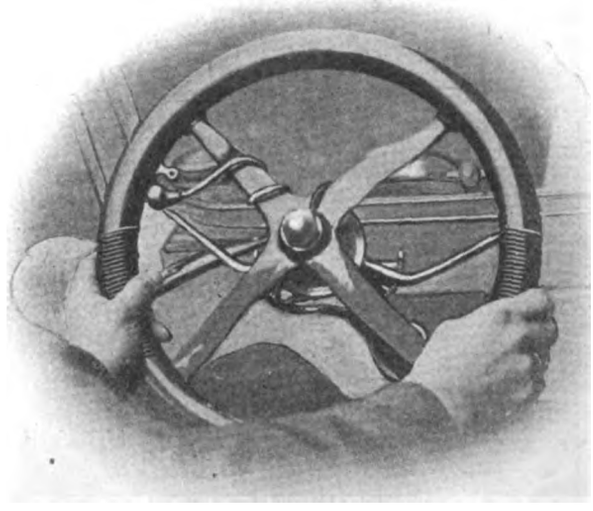
The Drivers Hands Are Cosy — And the Other Fellow's Stiff

The Warm Hand Wheel is an appeal to reason, good judgment and common sense and every Dealer who reads this can realize its practical worth without extended argument.



The Warm Hand Wheel robs winter driving of half its unpleasantness by giving a rich, warm glow to hands that grow cold and numb even in heavy gloves. Think what this would mean to car owners in your territory if you would simply demonstrate it.

Now, don't get the idea that it is impractical or complicated. Quite the reverse. It is just as simple as the electric iron, cook stove or the hundreds of devices that are heated by the current.

The Warm Hand Wheel is an economical consumer of electricity. It operates equally well from lighting systems or storage batteries. Ford owners will get splendid results from the current from the "built in" fly wheel magneto. In brief, the Warm Hand Wheel is adapted to any modern car.

You, Mr. Dealer, can install it in a short time without interfering with any working parts of the car. Its installation is as simple as its function.

The Warm Hand Wheel sells at retail for $15. Write and let us tell you how well you will fare in the transaction.

ERGON MOTORS

These Are Motors of Class in the Broadest Sense of the Word

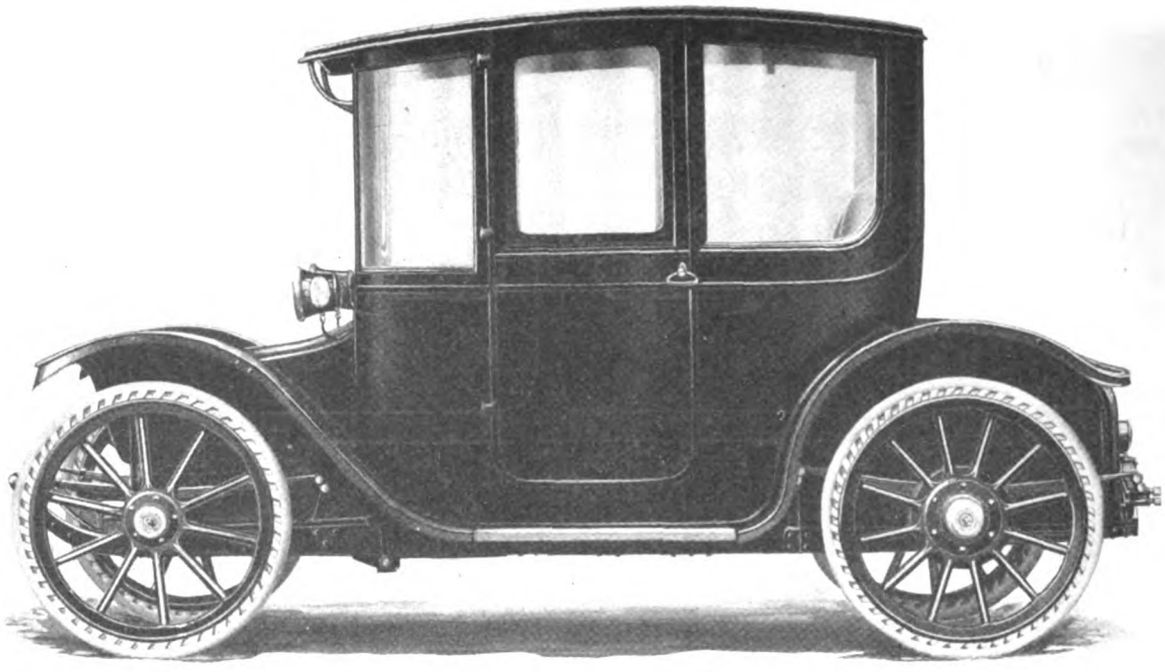
We stand ready to convince you that, judged from any standpoint you choose, Ergon Motors are possessed of as much "class" as any motor built.

Powerful, durable, simple, accessible—and each of these attributes in degree seldom present, all in one plant.

Remember, too, that we are counting upon your making us convince you that these are not mere platitudes. We are counting upon your forcing us to show more real development and value in Ergon Motors than you can find elsewhere.

Just by way of opening the investigation we beg to say that Ergon Motors are of the unit power plant type, with Brown-Lipe dry plate clutch, and three speed selective transmission.

Four cylinder, four cycle, long stroke, 4⅜ by 6, water cooled, L-head, with cylinders cast in pairs. Valve side carries simply the gas manifold, which is a combination one-piece inlet and exhaust. Water pump and magneto on opposite side.



Renold silent chain drive replaces timing gears, and provision has been made for several electric or pneumatic starters. Timken bearings in the transmission; clutch supported on F. & S. bearings.

Just give us the opportunity to "sell" you on these motors. Give us a chance to show how great a factor of safety is present in every phase of construction and material.

And after we have sold you, we'll more than make good not only on the motors but on service and deliveries as well.

ROCHESTER HAZARD MOTOR MANUFACTURING CO NEW YORK

The electric is distinctly the family car. The car for constant every day use—by every member of the family—under all sorts of weather conditions and for all occasions.

It is always ready—It is as easy to drive as a pony cart—And it has about it an atmosphere of luxury and comfort that is embodied in no other vehicle.

Century ELECTRIC

is an electric car among electrics—A car of distinguished personality—A car of superb proportions and simple elegance—

Its underslung body, scientifically suspended on long, flexible springs, makes it peculiarly an easy riding car.

This car will be exhibited at the Chicago Show. We have not closed any Western territory and should like to get into touch with dealers capable of selling this high grade automobile.

If you can not see the Century at Chicago write directly to our Sales Department for detailed information.

Hyatt Quiet Bearings

The Standard Type of the Hyatt Roller Bearing is designed with generous bearing length. This permits the rollers to operate directly on a steel shaft, thereby simplifying the construction.

The flexibility of the Hyatt Roller affords full line contact, hence an equal distribution of the load along the entire length of the bearing. Overloading at any particular point, causing excessive wear, is thus avoided.

The rollers of the standard type are now made of Chrome Nickel Steel, resulting in a greatly increased carrying capacity. Lubrication is positive—the rollers forming oil reservoirs. The right and left spirals distribute oil to every part of the bearing. Grit and dirt work through into the center of the hollow rollers, thus preventing grinding which would result in wear.

These are exclusive features of the Hyatt Roller Bearing.

KEETON
DETROIT, U.S.A.

The Six "48" Keeton Compares With the Best Foreign Cars!

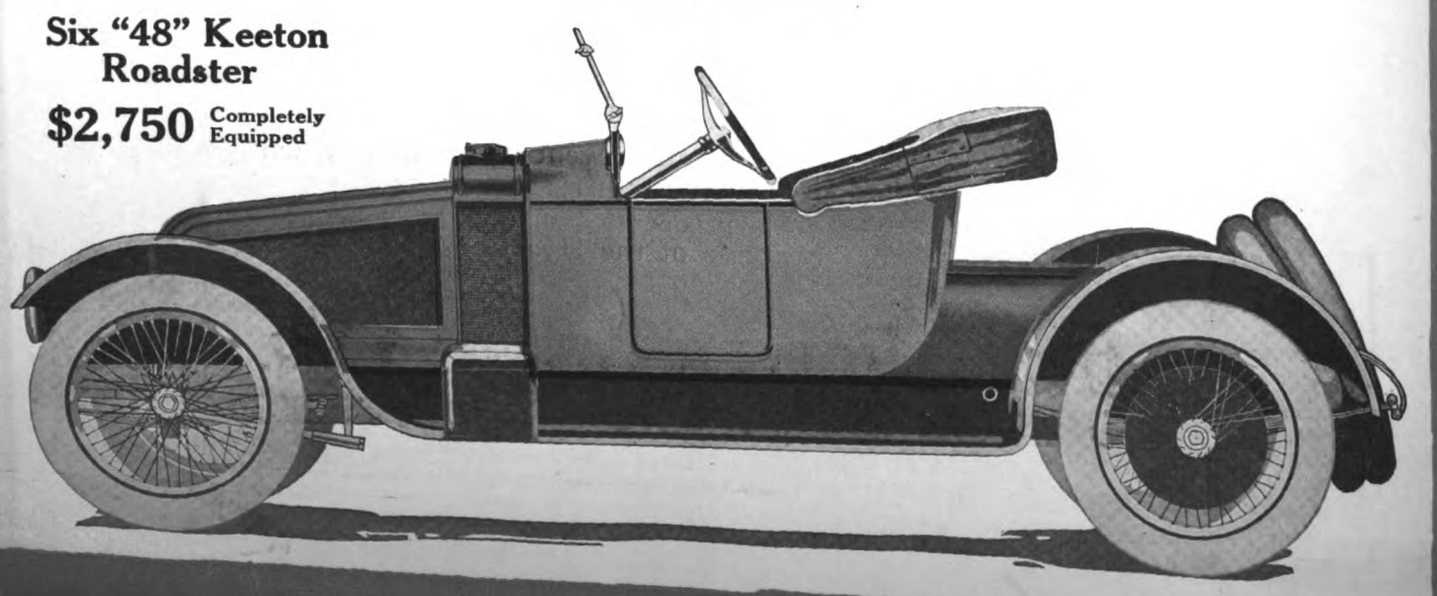
This car is in a class by itself—simply because it is a combination of American and European ideas in engineering and designing, and is made in the economical American way. That's why the price is so low. That's why you get luxury and quality which would cost you nearly three times as much if you bought from an importer.

Here is a car that you are proud to drive anywhere. You have the utmost luxury and comfort—the distinctive appearance. And every detail of construction is of such high quality that the Keeton will give service second to no car in the world.

Compare this car with the best foreign makes—look them over carefully yourself. Go over them point by point and you'll readily see why the Keeton is the **real sensation** of 1913. Perhaps you say that such a car cannot be produced, even in America, for such a remarkably low price, but again we say, compare.

In fact the Keeton is a car of true foreign type, built to stand American road and touring conditions. It is unusually light for a car which will accommodate seven passengers, weighing only 3,350 pounds, a construction which enables it to stand the hardest driving over the most unsatisfactory roads.

You'll notice several features of the Keeton which are entirely new for American built cars. But when you consider them carefully their superiority is obvious. The radiator at the rear of the motor means perfect cooling, without drawing dirt and dust into the hood, and also eliminates the fan equipment. Then, too, the radiator is protected. The transmission and axle bearings throughout are imported annular.



Again we ask you to compare the Keeton—for it is only by comparison that you can realize the great value we are offering. We will make only a limited number this year, and, of course, your order should be in early. Let us send you booklet describing the different models.

Six "48" Keeton Touring Car
$2,750 Completely Equipped

An European Type---At An American Price!

Few people will deny that they consider foreign cars better in many ways than those made in this country.
They are distinctive and more attractive in design, and have several features of construction which mean more efficient service. But the only fault found is in the price, which is very exorbitant to most buyers, because of the methods employed by the European builders and the high tariff.

Now in the Keeton you have a car that combines the very best ideas both in construction and designing, that have been produced on both continents.
And you buy the Keeton, with these advantages, at the American price.
The Keeton car answers every requirement of those people who want a car of foreign design, yet who feel that they do not want to pay the high prices.

Electric Starting.

Full Electric Light Equipment.

Transmission—four speeds forward.

Wire Wheels—with option of Wood Wheels.

Chrome Vanadium Gears and Shafts on imported Annular Ball Bearings.

Extra Detachable Wire Wheel, or Extra Demountable Rim.

Long easy riding Springs—long wheel base.

Left Hand Drive—Center Control.

Small bore—long stroke motor of exceptional power and flexibility.

Radiator at rear of motor—in proper and protected position.

The only true French type of car built in America.

Best of foreign practice adapted to American road and touring conditions.

Complete Equipment

Electric starting and lighting system, with 12½-inch head lights; tail lamp with license holder; 80-mile Speedometer and eight-day clock combined with electric light; Lamp for changing tires at night, with extension cord; Dynamo electric Horn; Robe and Foot Rails; Silk Mohair Top, with self-contained folding curtains and slip cover; Double acting rain vision Windshield; Option of Wire Wheels with extra detachable Wire Wheel, or Wood Wheel with extra demountable rim; Wheel or Tire Carrying Irons; Full Set of Tools; Pump; Jack and Tire Repair Outfit, and all Touring Bodies will take Auxiliary Seats.

Three Excellent Models

Riverside Touring Car, 5-passenger, Completely Equipped	$2,750
Two extra folding seats for above	25
Meadowbrook Roadster, Completely Equipped	2,750
Tuxedo Coupe, Completely Equipped	3,000
Chassis without tires or rear guards	2,250

All Prices f. o. b. Factory. Booklet on Request.

TO DEALERS: It is needless for us to say that these cars are selling fast. Nearly two-thirds of our 1913 output has already been sold. And when we say sold we mean contracted and paid for.
This is the one distinct car—the one car that has a demand all its own. It is the one car that has no competition from American cars, because of the style and design, and none from the foreign cars because of the price. The Keeton car appeals to the buyer who is accustomed to the best—but who will appreciate a fair price.
The Keeton is selling fast wherever we are showing it. We already have dealers in many localities, and are considering applications from others. It would be well for you to write us about your local territory. We may already have a dealer lined up, but will be glad to hear from you anyway.

"How I Got Him Coming"

Being the words and language by which a Franklin dealer started a customer with the ENTZ STARTER

"Mr. B. W. Smith of my home city owns cars, both high priced, one a four and one a six. He has not bought a new car since May, 1911. I have seen him regularly, once a month, about five minutes per call and never did he show the slightest interest. When I received the Dealers' Bulletin announcing the ENTZ STARTER, Mr. Smith was one of the first men I called on. When I talked the starter he was interested, though I saw at once he knew but little about them. This is the conversation, after I got under his skin with the starter proposition, as nearly as I remember it:"

Myself—"Your big car you know has an air starter."

Mr. Smith—"That's heavy, isn't it?"

Myself—"Oh, not so heavy, but any air starter is quite a bunch of stuff. Electric starters are the only thing now. The ——— has the Delco; you have heard about their switchboard on the steering——"

Mr. Smith (interrupting—"What has the ———?"

Myself—"Acetylene; probably will have an electric. The Entz is just three things—starter, battery and switch. The switch controls both the starter and magneto. That——"

Mr. Smith (interrupting again)—"The battery fires the motor?"

Myself—"No. Could, I guess. But you don't want to go back to battery ignition. The magneto is separate but connected with the starter switch. You throw on the switch we have and leave it on until you want to stop the engine. The engine won't stall. Any magneto is always ready to perform its function as long as the switch is on, and so is our starter."

Mr. Smith—"I like our big car; it is——"

Myself (interrupting)—"I know, but you won't buy a car now without an electric starter."

Mr. Smith—"How does the starter make the lights?"

Myself—"Simplest thing you ever saw; you throw on the switch, that connects the battery, and the current from the battery runs the starter, the starter runs engine, the engine speeds up and runs the starter; when the engine runs the starter the starter becomes a generator and charges the battery, the battery furnishing the current for the lighting and starting."

Mr. Smith—"But your engine heats up; I have been told that it gets hot in the summer."

Myself—"I can believe that you heard that. But your own motor is cooled by air. The water goes through the engine jackets and back to the radiator where the air cools it."

Here Mrs. Smith, who was listening, interrupted and said: "The water boils, too."

world, who will get into his car in the morning and take a party to a city 350 miles away for dinner that evening."

Mr. Smith—"I guess you're right."

Myself—"And I know from my own experience that he could drive back again the next day and not be tired. You positively can not get comfortable riding without resiliency and flexibility. Both of your cars are built on a rigid plan; they are braced and made stiff. We drive through the springs."

Mr. Smith—"Drive through the springs?"

Myself—"Yes; and there are good engineers yet who say that driving through the springs is not practical. But foreigners are coming to this type of construction. The Peugeot, the fastest long distance racing car France has ever produced and which won the Sarthe Grand Prix last September, drives through the springs, and like our car has no radius or torsion rods. The motor of this French car develops 175 horsepower and its maximum speed is 120 miles per hour. Your cars are braced and made rigid in every way."

Mr. Smith—"Do your cars rattle?"

Mrs. Smith—"Our cars rattle something terrible now, and really, I don't think the springs act at all. There is no give. They bump terribly."

I was surprised to hear Mrs. Smith use the word "give." I had not used it, and decided Mr. Smith had told her that the cars had no "give," which caused bumping.

Mr. Smith—"The springs are rusty."

Myself—"Our front springs are the same as the rear; the whole car is easy."

Mr. Smith—"What power is that car out there?"

Myself—"Thirty-eight."

Mr. Smith—"I want more power."

Myself—"No, what you want is ability; you want to figure ability rating not power rating."

Mr. Smith—"What do you mean?"

Myself—"I mean get the ability of the car not just the horsepower."

Digitized by Google

it gets hot in the summer."

Myself—"Yes. And you have no way to cool it except with air."

Mr. Smith—"But I have heard that your motor burns up."

Myself—"Those statements, I suppose, come originally from competitors. The best answer I can make you is that if they were true the Franklin Company would have been out of business long ago. In cars selling at $2,000 and up only two makers are selling as many cars as the Franklin Company."

Mr. Smith—"What's that?"

Myself—"That's right; only two high priced cars are selling better than the Franklin, and I don't think they are selling very many more."

Mr. Smith—"Is that so? You are third in cars over $2,000?"

Myself—"Yes. As for heating, I am ready at any time and so is any Franklin agent, to go into a cooling contest with any water cooled dealer, either fast or slow work."

Mr. Smith—"But it is when I run fast that my engine gets hot."

Myself—"I will take you out and run you any distance as fast as you want to ride; I will stop and lift the hood and you can lay your hand on any cylinder."

Mrs. Smith—"Does the heat from the engine spoil the paint on the hood?"

Myself—"That may happen, but it is not when you are running. It is when you stop and the heat from the engine radiates. But big cars now have special ventilators which you can raise and let the hot air out. This heat when standing still after running hard is the same on any engine."

Mr. Smith—"I am not as interested in long rides as I used to be."

Mrs. Smith—"It is tiresome to ride far."

Myself (to Mr. Smith)—"You have never had a real automobile ride; you don't know what it is to drive and ride in an easy car. My car out there has a reversible steering gear (I briefly explained the different types). Mr. Franklin, president of the Franklin Company, drives his car himself 300 to 400 miles a day. (I told him about Mr. Franklin's one-day trips the past summer as stated in the Bulletin.) I can say to you that there is not another automobile manufacturer in this country, and probably not in the

Mr. Smith—"I want more power."

Myself—"No, what you want is ability; you want to figure

Mr. Smith—"How?"

Myself—"Horsepower times gear ratio divided by weight times wheel diameter; that will give you the ability of the car. I can show you very high-powered cars where the ability rating figures out only 68 per cent. as efficient as our little six thirty, because of their weight."

Mr. Smith—"What is your gear ratio?"

Myself—"Three and seven-tenths to one, but you have to take them all into consideration. Why, my car out there with Silvertown cord tires will play with either of your cars anywhere."

Mr. Smith—"You get good tire mileage?"

Myself—"The Silvertown cord tires are very efficient. They give you 20 per cent. more ability on hills. But——"

Mr. Smith—"They do? How?"

Myself—"Resiliency. (Explained in some detail about the Silvertown cord tires and that they cost more.) But you are glad to pay the difference."

Mr. Smith—"I would use up three sets of those tires going one hundred miles."

Myself—"I expect you would, but not on our car. Our 1911 owners reported an average of about ten thousand miles."

Mr. Smith—"Your springs help the tires."

Myself—"Yes, and so does the resiliency of the whole car."

Mr. Smith—"How much mileage do you get on gasoline?"

Myself—"With the thirty-eight our owners report fourteen to eighteen miles. Some owners even report as high as twenty with our seven-passenger car."

Mr. Smith—"What! If I get five miles with my ——— car, especially in hot weather, I am doing well."

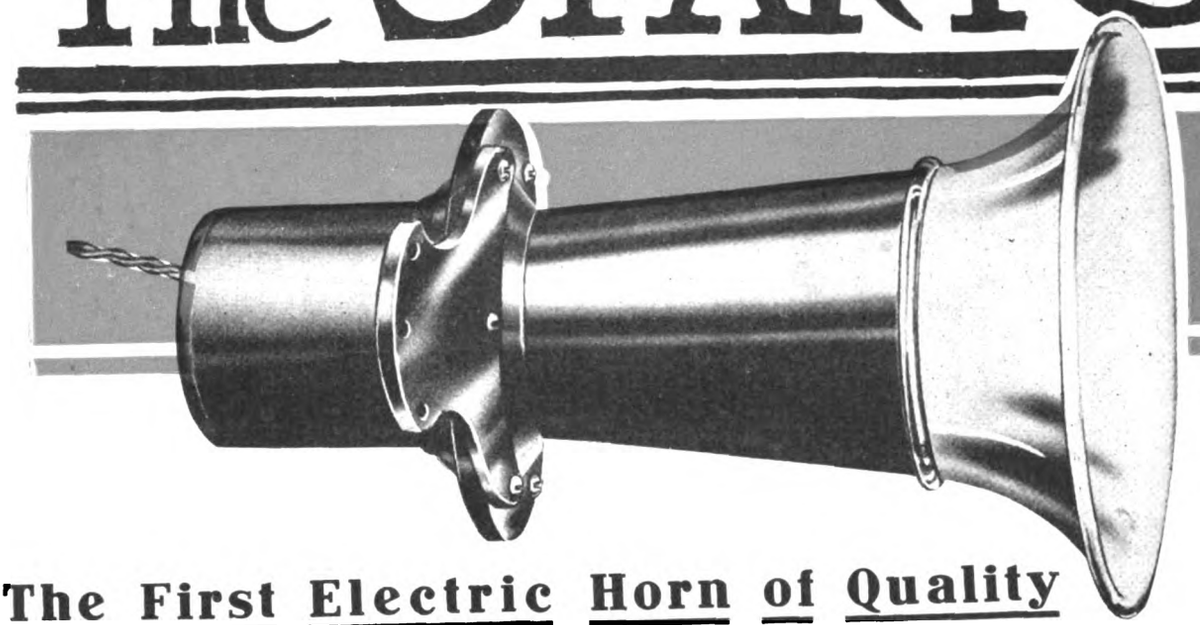
Myself—"I know; our car is not a hard car to handle nor hard to ride in nor is it hard on gasoline or tires."

Mr. Smith—"Tell you what you do, let me take your car for two or three days; demonstrations don't interest me. I want to use a car long enough to see how I really like it. If you have a car that's being used I'd like to take it."

Myself—"I'll do that. I'll have a little six with starter before long and I'll turn it over to you. Good night."

I GOT HIS ORDER

"I got his order. When the little six with starter came, I drove out with him and then left the car and my man for him to use. I left them entirely at his service for two days. I instructed the man to let Mr. Smith drive whenever he would. The best part of the story is that I lost the car, for I had purchased it for a demonstrator and Mr. Smith wouldn't give it up. He found that 30 horse-power was ample in an ability car. But I'll sell him a '38' later just the same."



NOTE---The dealer who gave us the above was at the factory and told us the story and we had a stenographer take it down. Other dealers have given us accounts of some of their interesting experiences which we shall also print.

The SPARTON

Dimensions:
Length, 12 inches
Flare, 7½ inches
6 Volts
Runson Dry Cells or Storage
Black enamel and brass or nickel bell

The First Electric Horn of Quality and Efficiency—At a Quantity Price

Big in Size—Big in Tone—Big in Value

To establish Sparton Value in your mind, compare it in tone, compare it in mechanical quality and efficiency; compare it from the standpoint of current consumption, appearance, size and finish, with the highest priced motor-driven horns. Then **compare prices.** The "Sparton" equals the best in quality, excels them all in durability and **its price is just about one-third.**

Quantity production alone makes possible "Sparton" Quality at "Sparton" prices. We have a capacity for producing 700 to 1,000 horns a day.

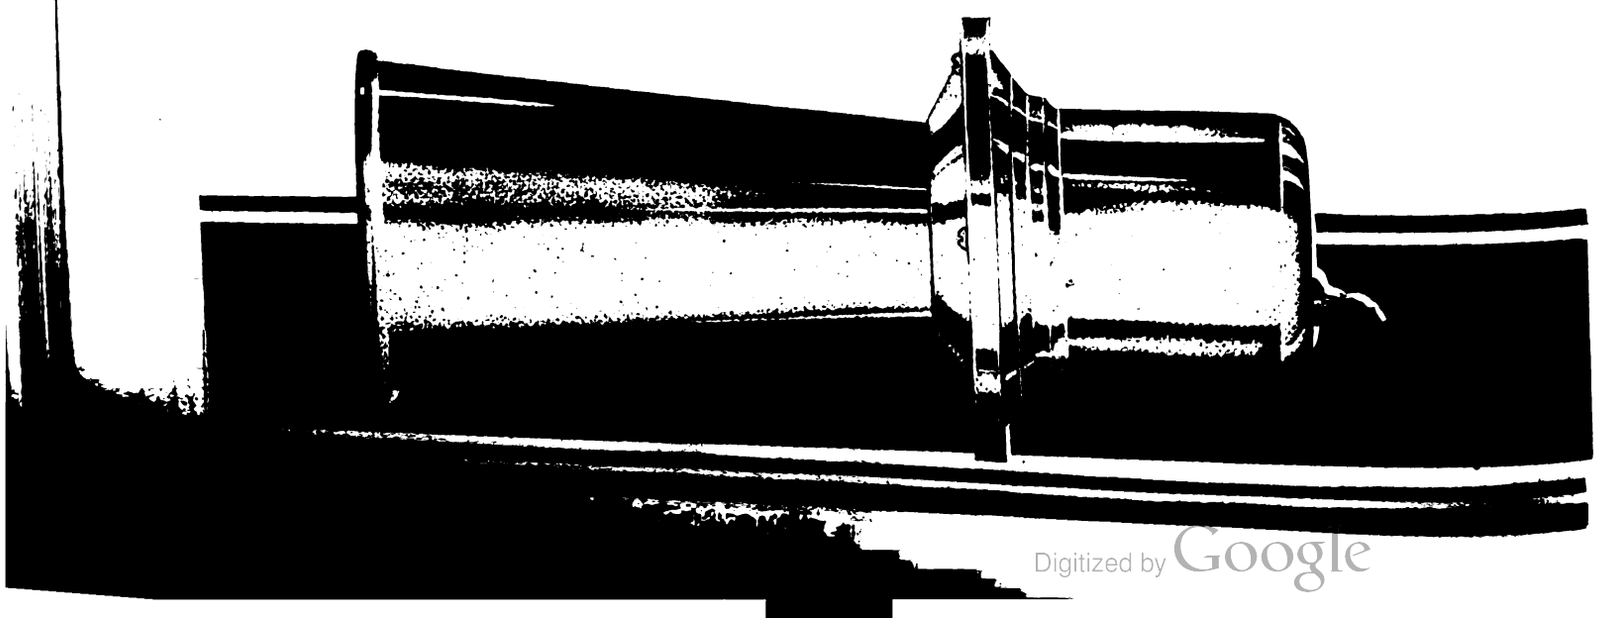
Two Styles Ready

Dash Type—In Black Enamel and Nickel or in Black Enamel and Brass.

Under-the-hood Type—In Black Enamel.

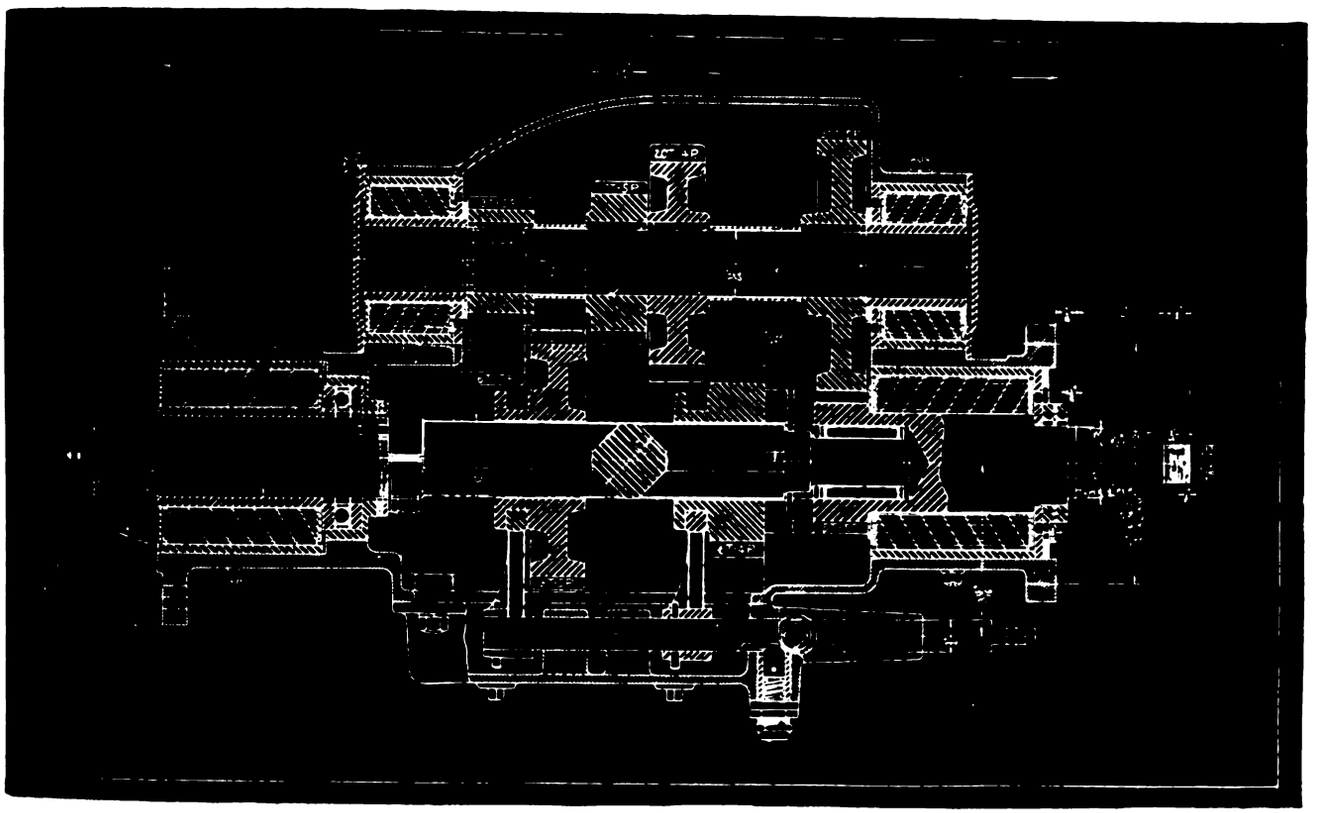
To Car Manufacturers

We are after "standard equipment" orders and can give immediate deliveries. We are setting a new pace for electric horn values. Write at once for sample horn and prices.



At Every Turn We Save You Profits That Every Other Manufacturer Must Pay.

We build our motors complete, manufacturing shafts and high speed bearings on high speed automatic machines; we stamp the laminations; wind both armatures and field coils; build a specially designed commutator; do all our own electrical work.



We stamp the bell, diaphragm holders, front and rear, diaphragms, diaphragm actuators, motor covers, push button springs and casings.

For all these operations other horn makers pay a profit to someone else.

American Axles

This High Class and Costly Construction Is To Be Found Only in American Axles

In *American Axles* of the bevel type, the pinion shaft has bearings on either side of the pinion.

The shaft has, therefore, the strength and security typified by the two strong hands in the small, upper illustration.

Cheaper construction omits the inboard bearing and endeavors to support the shaft in a one-handed fashion which proclaims its own weakness.

To add the inboard bearing, with its support an integral part of the housing, is much too costly practice for cars sold at the lower prices.

But for cars that must have the best of construction, the cost is more than justified in the continued maintenance of its originally perfect adjustment and the entire absence of noisy vibration.

American Axles equipment instantly establishes in your mind a sense of highest class: it supplies a basis by which you can unerringly judge a car.

NEW DEPARTURE BALL BEARINGS

American Made for American Trade

Gasoline Is Going Up----

and the users of motor vehicles are paying the bills. Abroad, where gasoline costs half-a-dollar a gallon, builders of automobiles use only ball bearings.

Why?

Because ball bearings are more thoroughly anti-friction than any other type. Friction scarcely exists in ball bearings, hence less power and less fuel are required to drive mechanism mounted on such bearings.

Other advantages are:

Minimum wear;

Maximum efficiency, endurance and dependability;

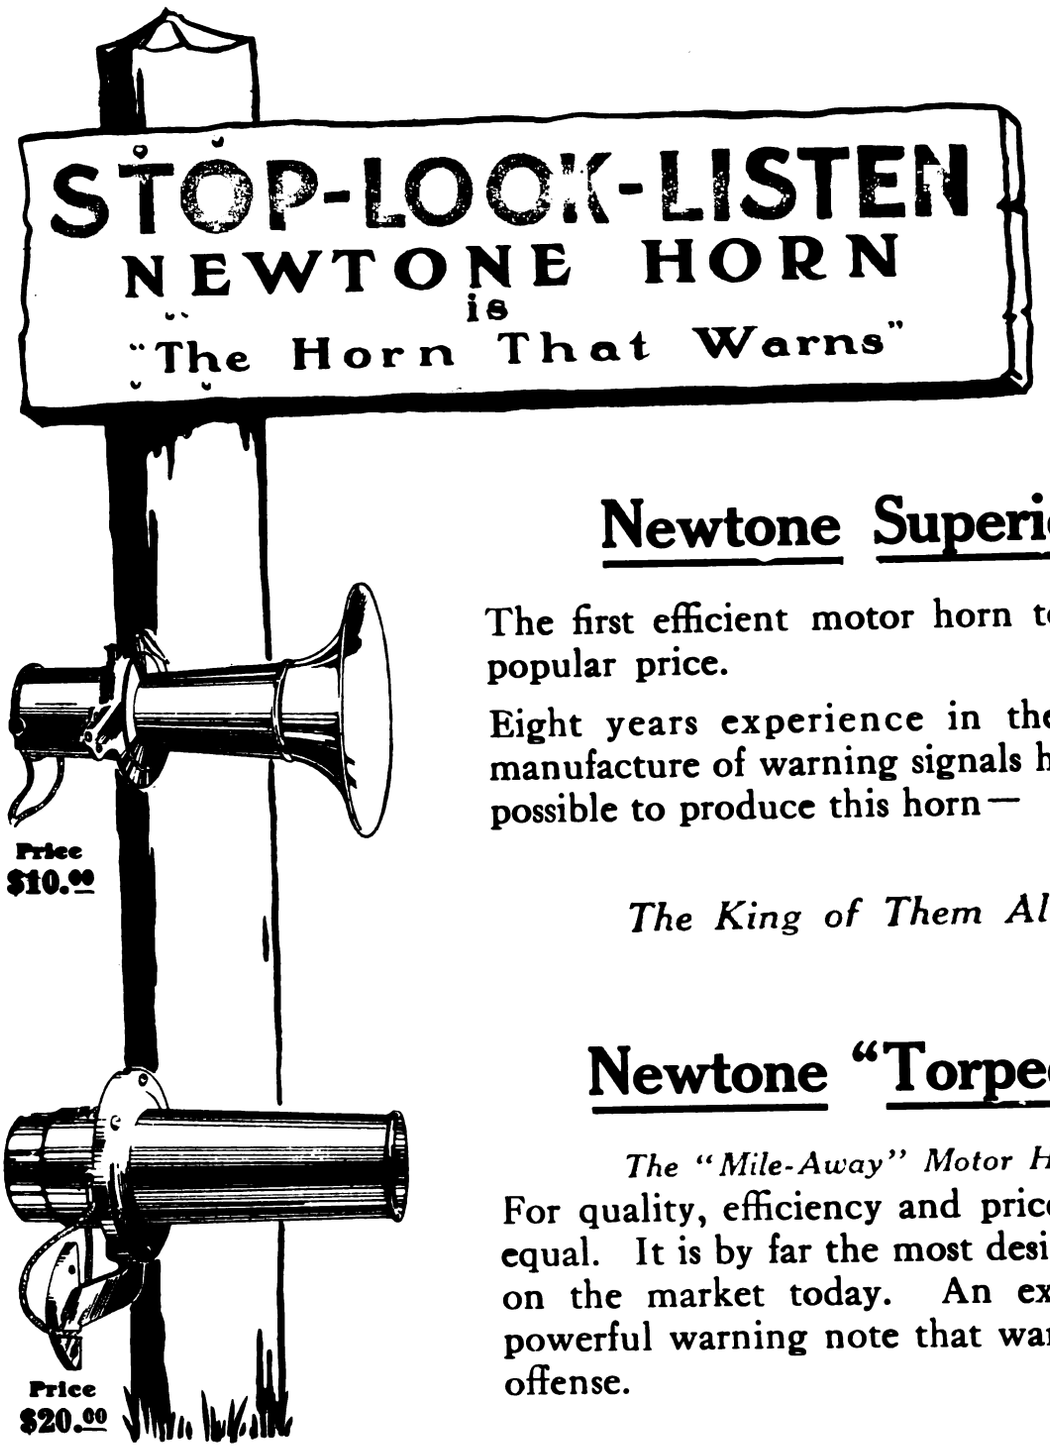
Ease of replacement;

Freedom from necessity of frequent adjustment—ball bearings are fool-proof.

The prospective automobile buyer will favor the car that will cost him the least to operate and maintain. This means he will favor the car that is equipped with ball bearings.

You are invited to visit our exhibit, Space No. 204, Balcony, Madison Square Garden

The American made New Departure ball bearings have no superior—are strongly guaranteed and perferred by the majority of American automobile manufacturers.



One such manufacturer says: "More real bearing value than I can get out of any other bearing."

This trade-mark of quality is HAYES MFG. CO. HAYES DETROIT, MICH. *on more than 250,000 boxes*

The Line of Beauty

Leads to HAYES Bodies

THE looks of a car have a lot to do with the sales. Looks are in the body—in the clear, clean-cut horizontal, the swelling curve of the rear seat back, the correct proportioning of shroud and hood, the graceful sweep of the fenders. The eye of the buyer notes these points before it goes deeper to motor and transmission.

Why Not Make the Most of It?

The Hayes organization has spent its entire career in the building of handsome automobile bodies and sheet metal parts. To your needs it can bring an unexcelled experience. Its engineers know bodies as your engineers know motors. They are at your service and the results of their experience is yours when you want it.

Let our engineers go over your blue prints. They will show you the short cuts and offer suggestions worth money to you. They will make you fenders, hoods, shrouds—anything in sheet metal that you want—that will prove a revelation.

You will save time, trouble and money. The Hayes organization will "speed up" your production; will stop your worry; will do the work quicker and cheaper than you can do it yourself.

Certainly this is worth investigating.

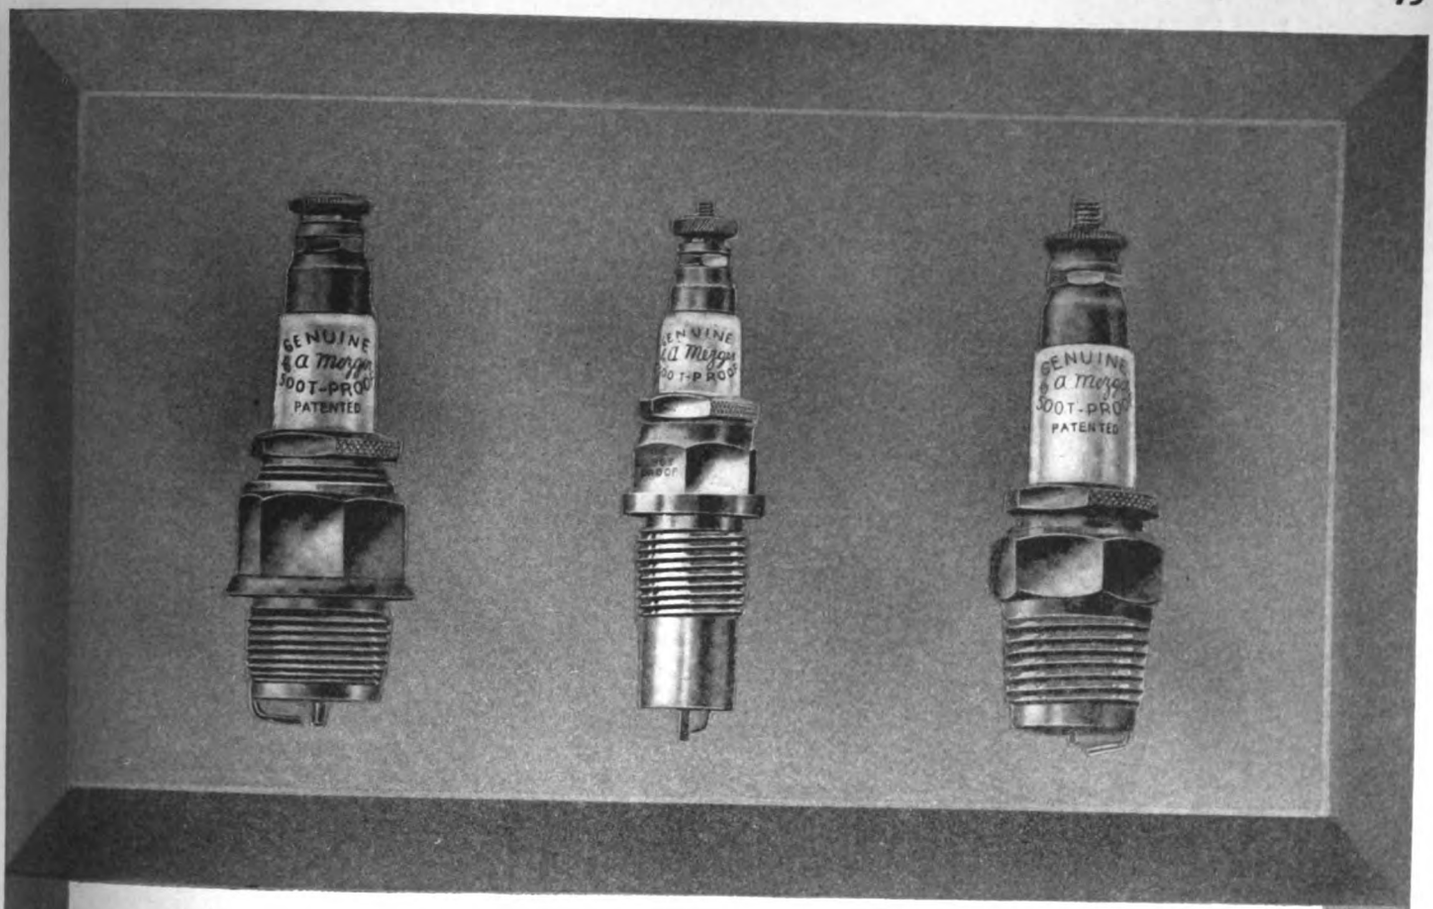
The First and Only Soot Proof Plug on the Market

Over Two Million in Use



All Standard Sizes

And It Is The Plug You Mr Dealer, can Sell With Satisfaction To Yourself and your Trade

Digitized by Google

All
Standar
Sizes

The Spark Is the Life of the Engine

¶ On its vitality depends freedom from engine disorder—a partial short circuit gives the engine a weak heart— a complete short circuit stops its beating.

¶ Carbon or "soot" offers medium resistance to current. If the space where it collects in the plug is limited, then a leak or complete short circuit must follow.

¶ The greater the length of the carbon collecting space, the higher the resistance. Consequently, the spark jumps the air gap—as it ought to.

Send for Our Booklet

¶ It will prove through plain statement of facts that the Mezger Soot Proof Spark Plug has a much greater porcelain area—(in two annular chambers) than has any other spark plug. Therefore, carbon resistance is great enough to send the current across the gap as a healthy constant spark.

¶ You will also be shown why this plug is actually self cleaning—why it is gas tight and why it will prove an all round, permanent, healthy part of the ignition system.

¶ DEALERS—get the big message—it's well worth reading.

Our magnificent new 1913 instrument is an example of highest development in the construction of a

Magnetic Speedometer

The magnetic principle is the only scientific principle of speedometer construction. It is—by far—the most costly construction. The magnetic principle—alone—permits the use of a frictionless indicating means and of low speed, non-vibrating drive.

THE NEW 1913

Stewart Speedometer

Has Four Splendid Features

The New 1913 Stewart Speedometer has the new "reversed" revolving Speed Dial with Zero Stop mounted on full jeweled bearings and operated by Tungsten steel magnet, Stewart "closed ring" type. Steady and accurate at all speeds. Read at a glance

We Threw It Away!

Our Old Centrifugal Type Speedometer

The first speedometer we made was of the centrifugal type—but long ago we cast it upon the scrap heap of the obsolete—

—because the governor of a centrifugal instrument must revolve at a high speed of over ***two thousand five hundred revolutions*** to the mile, causing vibration and bearing friction that no instrument can stand.

—because the centrifugal type ***will not indicate*** any speed under 7 miles an hour!

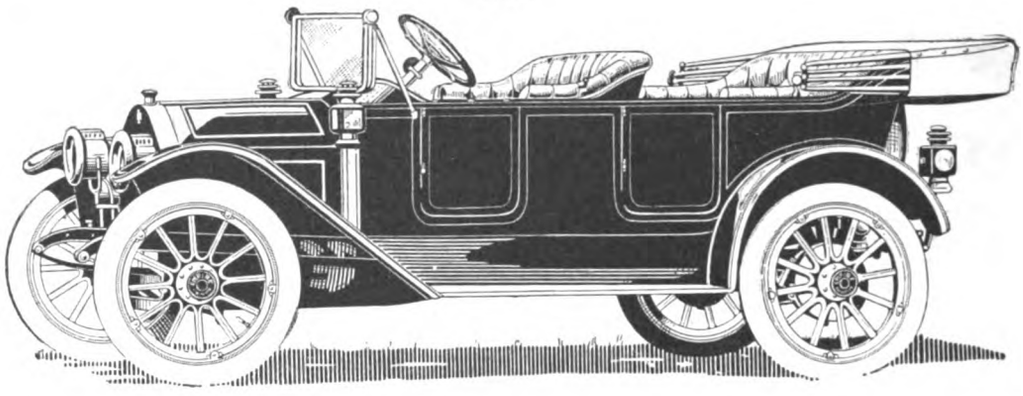
—because continued accuracy with a centrifugal type of speedometer is utterly impossible. It is necessary to multiply the movement of the indicating means ***sixteen times*** in order to get a movement of the pointer hand sufficient to permit the use of a scale large enough to be readable. ***Therefore, any error in accuracy is multiplied sixteen times!***

—because our new and perfected type of MAGNETIC speedometer has rendered all types of centrifugal speedometers crude and obsolete!

It has a big, sturdy 100,000-mile Season Register, operated by "direct drive" gears and controlled by "Geneva Stop" mechanism.

It has a 100-mile Trip Register that can be rapidly reset to any tenth of a mile and without disturbing the record of the Season Register. This is an excellent feature for motorists when following instructions of route book while touring.

It has the Grade Indicator with revolving dial mounted on polished bearings and operated by gravity. Shows the various percentages of grades from zero up to 30 degrees.



IF YOU DESIRE PERMANENT SATISFACTION SEE THAT THE MAGNIFICENT NEW 1913 STEWART SPEEDOMETER IS INSTALLED ON THE CAR YOU BUY

EMPIRE

"The Little Aristocrat"
Model 31

Style, Distinction and Character in every line.
Power, Speed and Strength to match the Design.

Completely Equipped $950

108 in. Wheel Base	Demountable Rims	Double Tire Irons	Speedometer
Mohair Top	Windshield	Prest-O-Lite Tank	Extra Rim
Top Envelope	Robe and Foot Rail	Head, Side and	Jack and Tool Kit
Storm Curtains	Oversize Tires	Tail Lamps	Eisemann Magneto

THE $950.00 completely equipped EMPIRE Five Passenger Touring Car meets the demand of those who know car values. Everywhere it is winning its way with expert motorists who demand a car of moderate size and price, and insist on having a real car, built of quality materials and honestly constructed.

WE knew that in time "The Little Aristocrat" would come into its own kingdom. We foresaw increased demand. But it was gratifying to have been compelled to establish a second factory.

We want you to know the EMPIRE. Examine "The Little Aristocrat." Learn why it has won, why it satisfies.

SWINEHART TIRES

Show You How to Save Over 30 Per Cent. of Your Tire Cost

This Non-Skid tire (Depression Type) is one that actually makes skidding *impossible.* The real skidless tire.

This then saves the cost of chains which average 20 per cent. of the cost of a casing—in addition to eliminating the chafing and tearing away of 20 per cent. of the life of the casing.

All made by the two cure, wrapped tread process—the most approved method.

Types — Clincher, Q. D. Clincher, Straight Side.

A TOTAL SAVING AVERAGING FROM 30% TO 50%

Thousands in use. Approved and adopted on cabs of seven leading taxicab companies in New York City.

Swinehart Smooth Tread Tires, made by wrapped tread, two cure process, the most approved method.

In Clincher, Q. D. Clincher and Straight Side Types.

They are made of the best materials throughout, which an examination will show, and a test will prove.

They never skid and they never wear chains.

Four times more wearing surface than any other non-skid. No buttons or projections to cause fabric trouble and their non-skid efficiency is good for two to three thousand miles, two to three times more than you get from others.

It pays to use **non-skids—good non-skid tires. Swinehart Non-Skids.**

"ALL THAT WILL BE MENTIONED, therefore, are the requirements which a good ball-bearing cage must meet:

(a) As small a space as possible between the balls, so that the maximum number may be put in; (b) To guide them well and safely; (c) To eliminate parts which may get loose, i. e., to make the cage if possible of one piece; (d) To use material which is not too soft, so that the cage will not wear out quickly;

(e) To avoid excess weight; (f) Solid elastic material to sustain shocks without breaking;

(g) Construction such that no parts can get between or under the balls and wedge them, in case the cage breaks; (h) Or, should the cage break, the work of the bearing will not be disturbed;

(i) Quickly putting into or taking cage out of bearing; (j) Ready access for the lubricant to the balls and raceways;

(k) To eliminate pockets in which foreign substances can become lodged and act as a brake on the balls; (l) To expose the balls so that the bearing can be cleaned and examined without taking it apart."—FRANZ J. JAROSCH, M.E., MEMBER OF S.A.E.

"The Easiest Riding Car In The World"

THE MARMON

Marmon "32" Five Passenger Touring Car, $3000.00

The Man Who Knows

Have you noticed the **change** in the automobile business?

A short time ago it was a question of selling a car to a man who knew nothing of automobiles—of their construction—of the **true** meaning of service.

Price was the first great question—or perhaps a car sold on its **appearance** alone—or because of its **equipment**—or because of one or two features that struck the fancy of **the beginner.**

Today the greatest proportion of buyers **know** the **real, vital propositions** that go to make automobile value. **One half** the buyers of automobiles have already owned a car.

You are selling to **"The Man Who Knows."**

The greatest percentage of today's buyers **know** how to size up a car—**know** how to judge its design, its construction— **know** it from the **actual** service it has given.

There lies the unequaled **advantage** of the Marmon. It is backed by the **prestige** of the Marmon name. The **superiority** of its design and construction is acknowledged everywhere by experts. Its records in the world's greatest contests have **proven** its unequaled durability. Its records of service in the hands of owners have **strengthened** and **added** to its reputation.

The more a man **knows** about automobiles the more he will be **impressed** by the Marmon in every feature.

Such a car **cannot be assembled** even from the best products of several manufacturers. It must be designed and constructed **complete** by one organization with extraordinary care and thoroughness **in every step** of its manufacture from the skilled engineer's drawing and the raw material to the completed car.

Nor can such a car be turned out **by the thousands** to meet the low initial price required by the **inexperienced** buyer.

Sixty years of experience in the manufacture of high class machinery, sold in every part of the world, have taught us that there is but **one** way to construct a machine to give **constant** service. The fruit of this experience is the **high standard** of Marmon construction.

You, who buy cars, know as well as we, who **make** them, that there is but **one** way to give satisfaction in an automobile—and that way is to make it, with every care, for years of service.

You wise buyers—"The Men Who Know"—are looking forward into the future. The day of the car with Marmon reputation behind it and Marmon service in front of it is just **dawning.**

The Marmon "32"

32-40 h.p., 120-inch wheelbase, dependable electric starting and lighting system, left-hand drive, center control, nickel trimmings, with newest body types to meet every requirement and corresponding equipment—

$2,850 to $4,100

The Marmon Six

48-80 h.p., 145-inch wheelbase, dependable electric starting and lighting system, left-hand drive, center control, nickel trimmings, with body types to meet every requirement and corresponding equipment—

NATIONAL AUTOMOBILE LOCK WASHERS

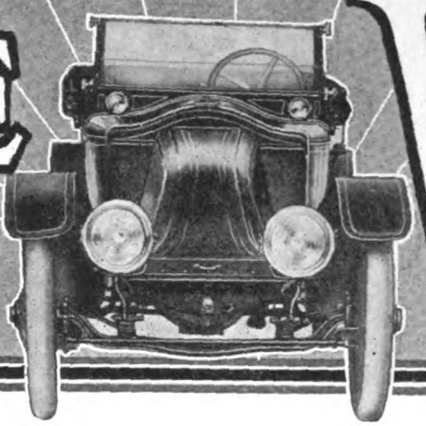
STANDARDIZED QUALITY THAT COUNTS

SECTIONS AND PATTERNS SHOWN IN PANEL HAVE BEEN ADOPTED BY THE SOCIETY OF AMERICAN ENGINEERS

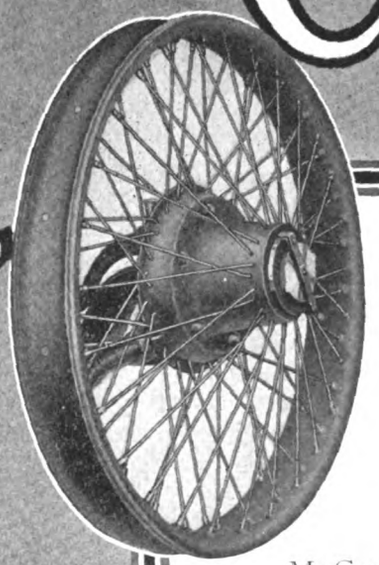
The lock washer is a small car part with a mighty big mission. It is evident that this is not realized by the purchasing departments of car factories, for in this item the order usually goes down—"get quotations on lock washers."

The lock washer is the bond of the units. If it lacks design, proper resiliency, and resistance to fatigue, then it can destroy alignment of bearings and create small and grave troubles in various parts—and the loose nut with the inefficient lock washer is usually eliminated from trouble possibilities when it should be traced to this obscure but most important part of the car.

The responsible purchasing head (the one we want to reach) will order lock washers that will insure security of parts—and he won't hesitate on a few-cents-per-car-difference.



To such we demonstrate the positive superiority of National Lock Washers. They will give 100% service in security and length of life.



THE NATIONAL LOCK WASHER CO.

Chicago, Ill. **Newark, N. J.**

McCUE WIRE WHEELS

New York newspapers, in a forecast of the automobile shows, lay great stress on wire wheels as a coming refinement for 1913—**notably** the **only radical departure** from established practice in the whole group of changes, which reflect mainly body design and starting devices.

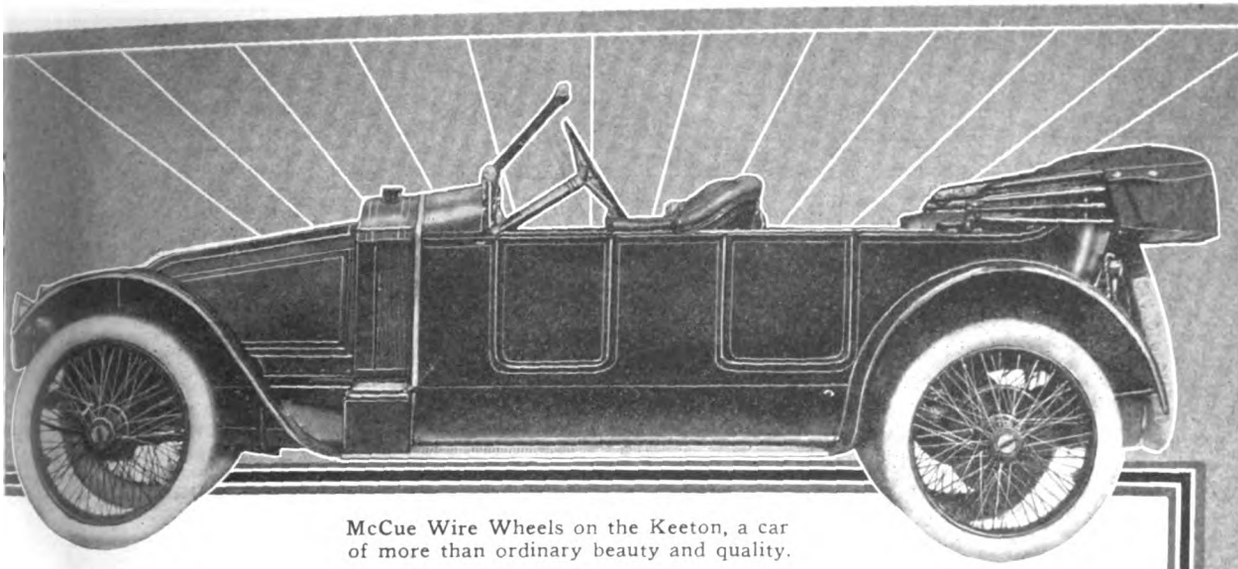
WIRE WHEELS ARE HERE TO STAY. They are just as certain as was the four cylinder motor in days of one and two cylinder design.

McCue Wire Wheels are slowly but surely cutting into the tire industry and this is but logical and right, because your customers, Mr. Dealer, have every right to have their pocket books protected by **you** — and by ourselves. **They** are not interested in rubber stock and dividends.

McCUE WIRE WHEELS

Increase Tire Life From 50 to 70%

a fact so plain that tests to prove it were scarcely necessary—although we have made many of them.



McCue Wire Wheels reduce the terrific pounding at point of tire contact, to a "tack hammer" blow, as it were, because the greatest weight of the wheel is at the hub—the lightest at the periphery or point of road contact.

You can strike a terrific blow with a ten pound hammer if you grasp it by the handle—but you can't do execution if you grasp it by the head and use the end of the handle as the striking point. The "hammer head" of the McCue Wire Wheel is the hub—the light end of the "handle" is the rim.

And it's this pounding that drives the life out of the tire, and takes away hundreds of miles of usefulness. Then the car owner "digs" for more tires—or sells his car in disgust.

On high speed, McCue Wire Wheels again conserve tire life by metallic radiation of frictional heat as fast as it develops — another dollar saving feature.

Digitized by Google

McCue Wire Wheels on the Keeton, a car of more than ordinary beauty and quality.

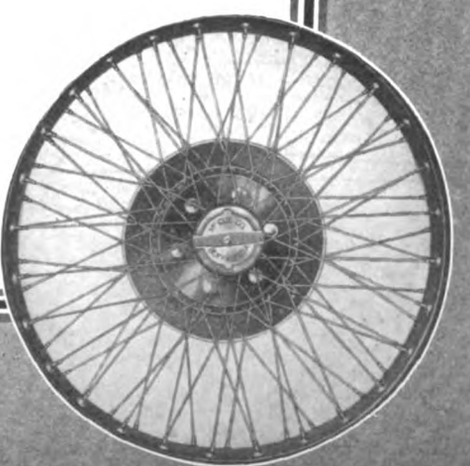
We discard the demountable rim as radically wrong, because it increases weight at the point where weight must be held at a minimum. This is why McCue Wheels are detachable. It's as easy to carry this wheel as it is to carry a rim—and it's even easier to attach.

Where do you stand in this matter, Mr Dealer? Are you going to continue to accept and sell cars with wooden wheels, long after the public knows of their awful appetites for tires—are you going to let competition invade your territory "wire wheel equipped"?

Or are you going to use your influence with your manufacturer—and get there first?

McCue Axles

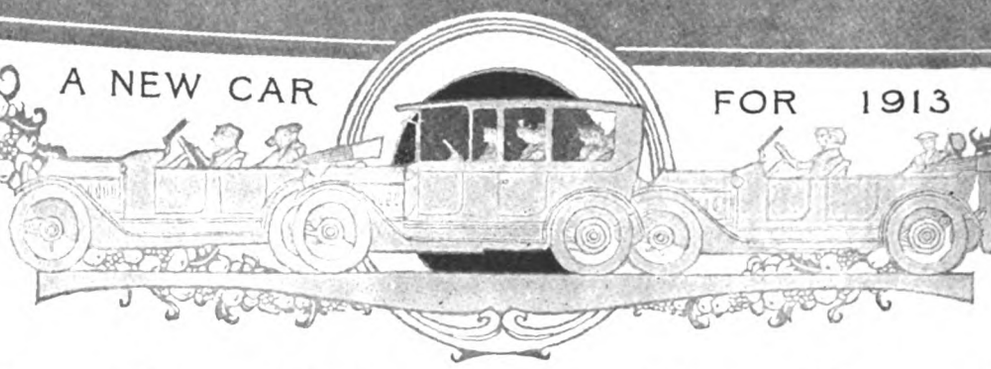
represent the best in axle making, material, design and workmanship. All combine to give maximum service under all conditions of road shock, side thrust and load.



If your customers want wire wheels, you write the manufacturer for inner hubs and wire wheels to go on the particular model to be so equipped. We are situated so that we can meet this demand for the manufacturer.

THE McCUE COMPANY, Buffalo, New York

The (S) brand of steel wire automobile spokes is used in McCue Wire Wheels. Both spokes and nipples are made by The Standard Company of Torrington, Conn.



The (S) spokes are made from special drawn carbon stock of exceptional tensile and torsional strength combined with extreme bending qualities.

The Standard Company as an allied company of the Coventry Swaging concern is able to secure wire of standard set by the English concern.

A NEW CAR FOR 1913

EDWARDS KNIGHT

A Great Achievement!

A NEW domestic car which in material, equipment and design equals the best cars on the market regardless of price. This is the achievement of C. G. Stoddard and H. J. Edwards—men of long and successful experience in the automobile industry—who offer the Edwards-Knight as a car in which no detail of perfection is lacking, a car which is "up to the minute" of motor car excellence.

Edwards-Knight Engine—Silent, powerful, flexible, economical. Shaft Drive with Worm Gear. Electric Lighting and Starting Device. Unit Clutch and Transmission. Power Tire Pump. Bodies of most graceful lines and perfect finish. Cantilever Springs and Wire Wheels make it the easiest riding car in the world.

LOWER COST
ON MOTOR TRUCK PARTS

UNIFORM accuracy in large screw machine parts saves time in your assembling, and increases the value of your car.

Driving shaft, radius and connecting rod parts, axles, brakes, etc., for motor trucks are just a few of the NAMCO parts now being used by many builders of trucks. The number of machines in our factory running continuously on work of this character has doubled in the past year. This shows that more manufacturers are realizing the value of accurate product coupled with a service made efficient by a splendid equipment and a thorough knowledge of trade requirements.

Let us have your samples. Our quotations are based on practical knowledge and will be right. Ask for "Special Milled Products" book, it shows many truck parts made in our factory.

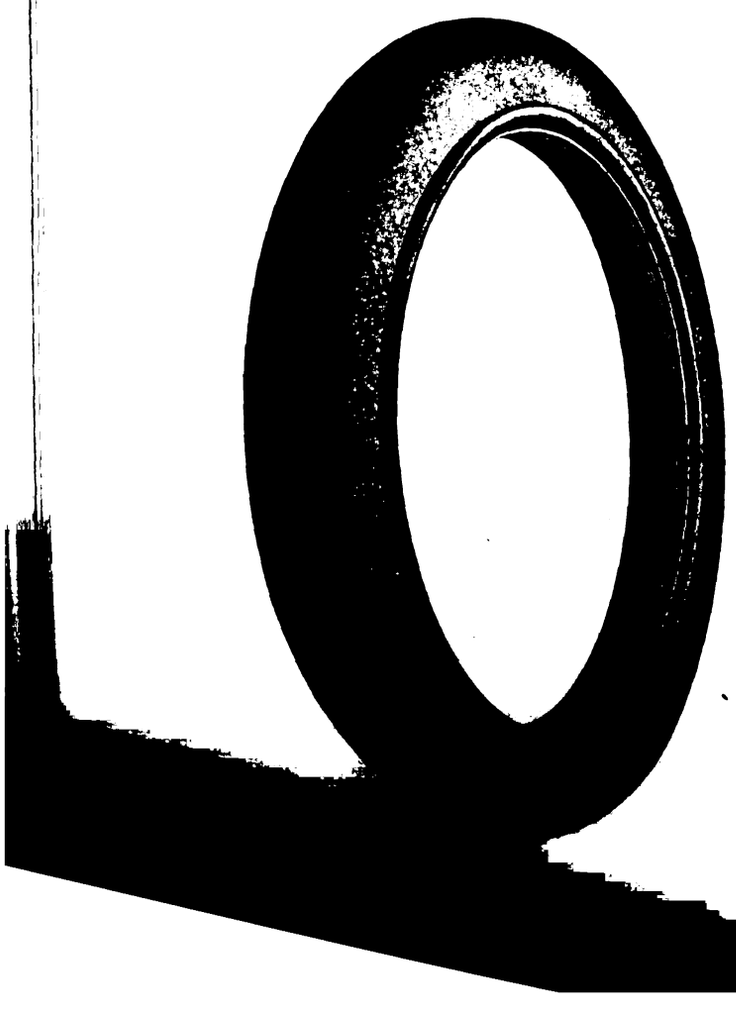
STANWELD Rim No. 30 is designed for those who require a demountable rim of minimum weight and extreme simplicity.

It has both the quick detachable and demountable features and is made in two styles, one for straight side tires and one for clincher.

This rim is split circumferentially, the two sections having corresponding lugs that are locked together by two semi-circular rings. One end of each ring is securely rivited to the wider portion of the rim base. The free ends of these rings are secured by a swinging latch which is in turn locked by a cam latch.



No special tools are required to operate this rim and no circumferential movement of either section is necessary to disengage the two parts of the rim base.

The rim base of STANWELD Rim No. 30 will fit the felloe band of either the Continental Gilbert type rim or the Standard Universal No. 3 rim, without requiring any special wheel work or additional equipment.

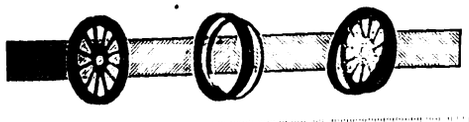
The Standard Welding Co.

Cleveland, Ohio

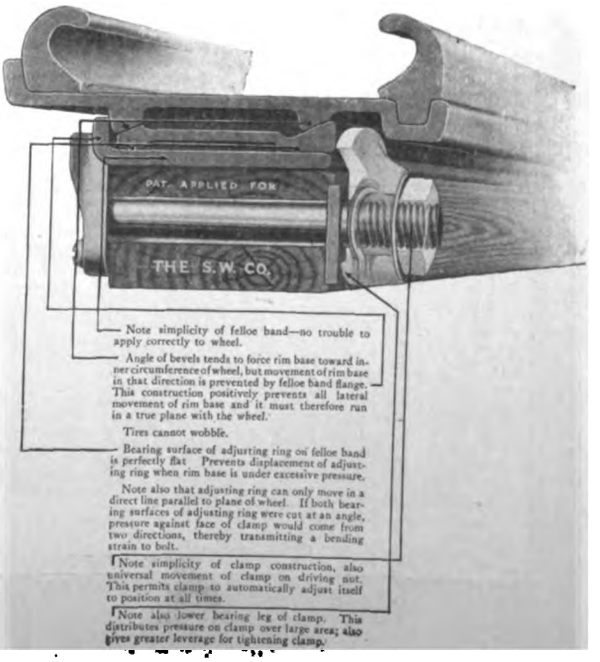
Digitized by Google

STANWELD demountable rims, series No. 40, stand alone in their pre-eminent efficiency.

Universal in their acceptance of tires, automatic in their mechanical operation, combining both a quick detaching and demounting feature which operate independently, and positively preventing wobbling of tires, they surmount all the defects of former types of demountable rims.



STANWELD rims, No. 40 series have an entirely new feature for the securing of the rim base to the wheel —The adjusting ring. This device is an intermediary band that lies under the entire rim base and supports it at all points of the front and rear circumference.



The rim base has the felloe band flange as a guage for its lateral position and must always lie in the same perfect position on the wheel no matter how the clamping devices are tightened. This is the preventive of tire wobbling, one of the prime reasons for excessive tire expense.

Number 40 STANWELD rims are the wheel equipment on all leading makes of cars.

The Standard Welding Co.

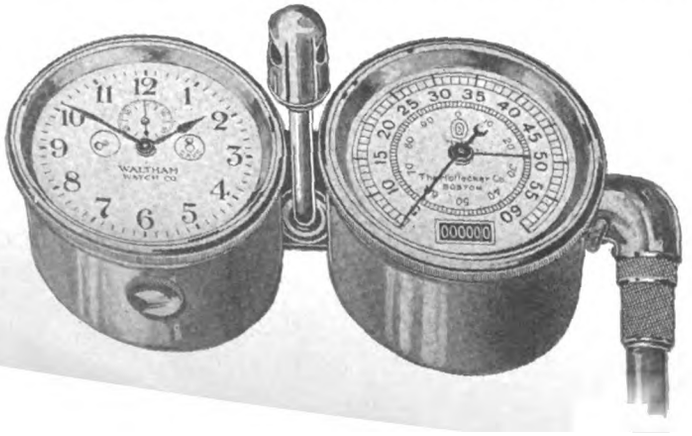
Advertising that is 100% Efficient-

HOFFECKER SPEEDOMETERS



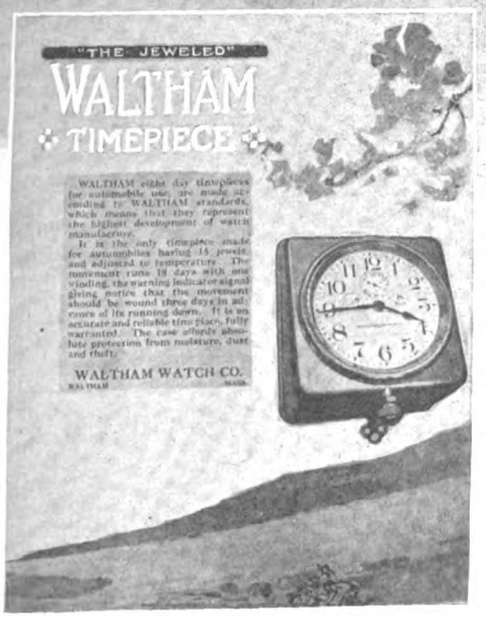
The wife of John Wesley, founder of Methodism, once asked him why he preached a certain sermon so often.

He answered, "Because, Susanna, once telling is not enough."

We are again emphasizing the value of **sane, rational, telling** advertising as it makes for quality of Hoffecker-Waltham products and for demand that strikes home to the manufacturer and gives force to the dealers' recommendations.

Hoffecker Speedometers and Waltham Time-pieces are master works of master minds. They are made from designs and built of materials that insure the car owner absolute accuracy and many years of service without the loss of one iota of reliability.

Cost of production is higher than that of any other similar combination —but we put cost of production **above** cost of selling—in other words, we give the car manufacturer the best speedometers and time-pieces that can be built and at prices within reason.



The money usually spent in this line for "one shot-in-a-hundred" advertising is spent by us in salaries, equipment and material.

This is a repeated message of square dealing with the car maker, the dealer and the car owning public. **We want it to sink in**

Digitized by Google

What it means to you and your Trade

WALTHAM TIME PIECES

You, Mr. Dealer, serve your own best interests when you use judgment in the recommendation of accessories. In these days the man who buys a car, buys much more than chassis, wheels and body. He **wants** to buy **quality** in **all** of the smaller necessities and luxuries. He looks to **you** as the expert to help him out

Dealers are the final arbiters of demand. Manufacturers look largely to them as the men with fingers on the pulse of demand.

We are advertising Hoffecker-Waltham quality to several hundred thousands of readers of the Automobile, Motor Age and Motor, (double page spread shown here), all publications that go to those who are directly and vitally interested as car owners and prospective car owners. It's Simon-pure, strong advertising that is the final link connecting up the man who makes, the man who sells and the man who buys cars.

We are putting the best speeedometers and time-pieces in the world before the trade and public in an inexpensive but telling way. If you want specific details to back your arguments, write to either factory and you will receive positive proof that these instruments of permanent precision well justify you in recommending them to your trade and in specifying them on the cars you sell.

Digitized by Google

What Shows Don't Show

By R. E. Olds, Designer

You'll see the new model of Reo the Fifth at your local Automobile Show.

It will strike you as beautiful, luxurious, roomy—having every final touch.

But here are things you can't see. And they mean, in the end, more than all that shows.

Tire Mileage

Tires on a car form the chief item in upkeep. Tire-saving means more than all other savings together. Every old motorist knows this.

So this year I add 30 per cent to my tire cost, to add 65 per cent to the average tire mileage. I give you tires 34 x 4. Compare them with rival cars.

The usual tires on this type of car would more than double your tire cost, so tire makers say.

No Possible Flaws

The steel in this car is twice analyzed, to make sure it accords with my costly requirements.

The gears are tested in a crushing machine, to prove that each tooth will stand 75,000 pounds. This test is usually made with light hammers.

The springs are tested in another machine, to stand 100,000 vibrations.

I use in this car 190 drop forgings. The average cost is twice that of steel castings.

But they give me lightness and strength. And hidden flaws can't occur in drop forgings.

The various parts of this car get a thousand inspections. Thus all the uncertainties are completely eradicated in building this Reo the Fifth.

No Broken Bearings

I use in this car 15 roller bearings, 11 of them Timken, 4 Hyatt High Duty.

They cost five times as much as the usual ball bearings. But good roller bearings don't break under strain.

No Overtax

It's the sudden shock which shows up a car's weakness, not the ordinary tests. And sudden shocks will come.

To withstand them, I give to axles and driving parts 50 per cent over-capacity. I have made them all ample for a 45-horsepower car.

To prove them out, I ran one of these cars for 10,000 miles, at top speed on rough roads. I met at its worst every possible road shock, and not one important part gave out.

I use 14-inch brake drums. I use 2-inch, 7-leaf springs. I use costly steels—chrome nickel, vanadium, manganese—all to ward off an overtax. I place cost below safety in this Reo the Fifth.

No Troubles

That isn't quite true. All machines have their little troubles. But I've gone to the limit to save trouble with this car.

Each engine is tested 20 hours on the blocks, and 28 hours in the chassis. There are five long-continued tests.

My carburetor is doubly heated—with hot air and hot water—to save the troubles with low-grade gasoline.

I use a $75 magneto to save ignition troubles. I use a centrifugal pump, instead of a syphon, to insure the water circulation. That costs about $10 extra.

Cars are built slowly and carefully, parts ground over and over. I limit my output to 50 cars daily, so nothing shall be slighted.

No Skimping

To make the car show my infinite pains, I give equal care to the finish.

The body has 17 coats. The luxurious upholstering is of genuine leather, filled with the best curled hair.

There are three electric lights, and the dashboard lights are flush. And the whole car, even under the hood is fully nickel-trimmed.

Center Control

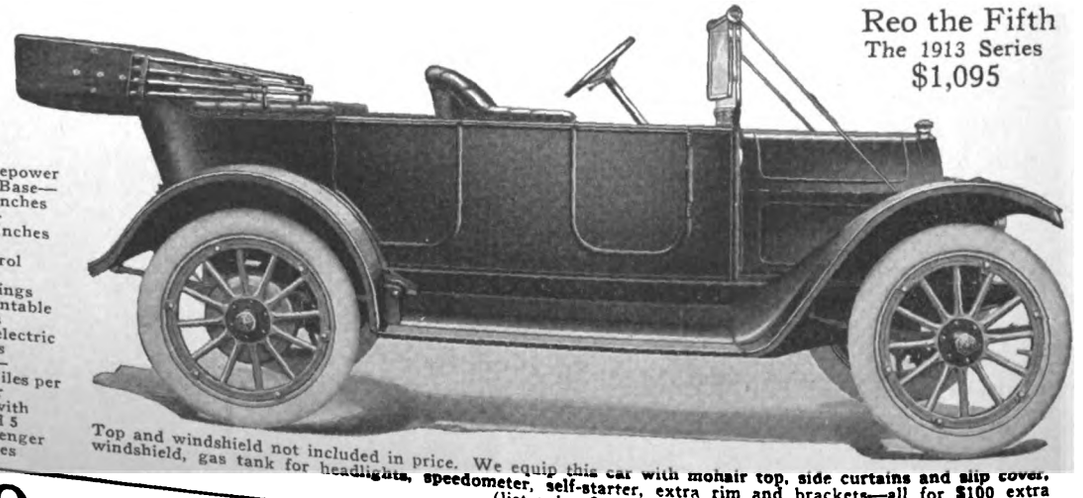
Our center control is exclusive to this car. All the gear shifting is done by one small handle, completely out of the way. It is done by moving this handle only three inches in each of four directions.

Both brakes are operated by foot pedals. So no levers at all clog the way of the driver. And this permits of the left side drive.

No other center control will please a man who once discovers this.

Add $200 to My Cost

These extremes, I figure, add $200 to the necessary cost of this car.



They cut down our profits. They force us to factory efficiency. They compel us to build every part ourselves. And, to minimize cost, we build only one chassis.

But these things save users from three to ten times what it costs me to give them to you.

They insure to you safety, economy, comfort. They insure to me that reputation I have spent 26 years in acquiring.

I find that car users, more and more, are coming to look for this class of car. Our output is always much oversold. And this year, with 60,000 excellent cars to my credit, the demand will be greater than ever.

A thousand dealers are now ready to show this new model of Reo the Fifth. Our 1913 catalog is also ready. Write us for it now.

Top and windshield not included in price. We equip this car with mohair top, side curtains and slip cover, windshield, gas tank for headlights, speedometer, self-starter, extra rim and brackets—all for $100 extra (list price $170).

We Want Dealers to Sell Kushion Kore on the Same Basis and in the Same Way They Sell Tire Chains or Electric Horns or Any Other Automobile Accessory.

THERE'S real merit in Kushion Kore—and there's a real demand for such a product. Consequently Kushion Kore is a profitable accessory for every live dealer to handle—on the same basis and in the same way any other legitimate accessory is handled.

WE ARE NOT TRYING TO ROB YOU BY ANY TERRITORY SELLING DEAL

We want honest, energetic representation for an honest, meritorious product—upon which we both can make an honest profit.

We ask you to buy only the actual goods you sell—goods that we will stand back of and guarantee to the absolute limit. And if we can't satisfy you absolutely as to our responsibility and fairness not only legally but morally as well—if we can't convince you that a year's business relations will be not only profitable but enjoyable and satisfactory in every way—then don't start to do business with us.

As we stated in our announcement we're in business to stay—we can only make good by having you gentlemen satisfied and pleased to co-operate with us. This fact is your best guarantee of our business methods.

In many respects Kushion Kore is superior to air in tires. Blowouts and punctures and attendant delays are avoided. In many instances a car absolutely rides easier on Kushion Kore than upon air. Neither extreme heat or cold will affect Kushion Kore. It will always retain its shape and consistency regardless of temperature, weather or road conditions. We don't know how many casings it will outlast—we've only worn out a few. But we believe that Kushion Kore will last so much longer than you dream it will that you'll be glad to buy new when needed. Kushion Kore is free from glycerine, glue, gelatin or any other solvent in water. It is not poured into the tube. As a matter of fact the tube is dispensed with, as Kushion Kore is placed in the casing of the tire enclosed in a knitted cover in its original form. Kushion Kore is 10 to 20 per cent. lighter than any other filler and unsurpassed in any way.

Are you the live dealer we want to represent us in your city? If you are we can show you how to get a lot of satisfied customers to say nothing of your profits while getting them. Write us today.

AMERICAN KUSHION KORE TIRE COMPANY
65-67 Main Street BUFFALO, N. Y.

We will exhibit at New York, Grand Central Palace, January 20-25, Space 414B; Boston, March 8-15, Space 225.

Lesser Forties Can't Compete With This

Hundreds of dealers, on both sides the Atlantic, have conceded the Michigan "40" this year the topmost place at its price.

And millions of dollars have been staked on this fixed conclusion.

You may be sure that motor car buyers won't differ with this verdict.

Buyers of "40's"

This year will demand this up-to-date-ness.

They'll demand four forward speeds.

They'll want big tires, big brakes and springs, wide seats and ample room.

They'll want electric lights, center control, left side drive. A 22-coated, nickel-trimmed body.

They'll want big over-capacity.

And we are leading them to expect these things at $1,585—the new Michigan price.

In a Cameron Car

We are giving these things in a car built by Cameron, who has seen 100,000 of his cars make good.

We are giving a body built by John A Campbell, who has designed for kings.

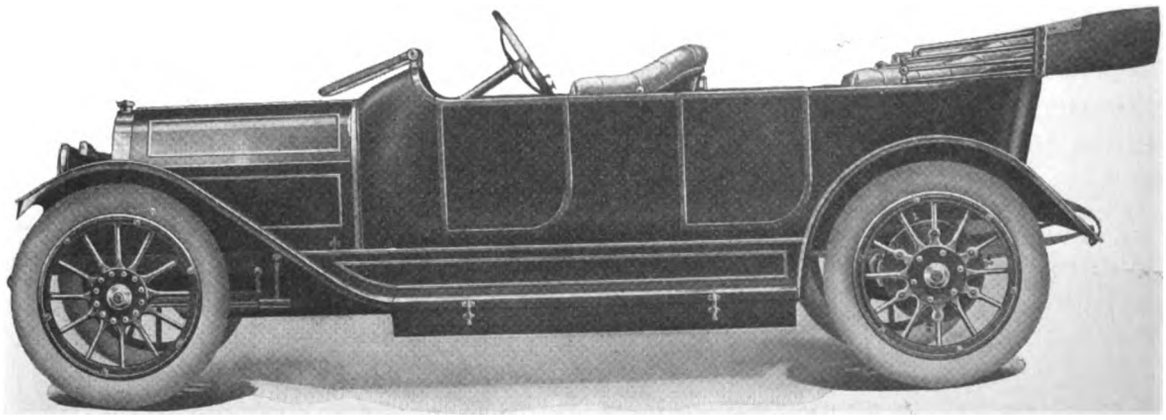
We are giving a car in which, in four years, we have worked out 300 improvements. And 6,000 cars have already proved them out.

We give all this, plus all the features named below, for $1,585.

There are 72 Forties on the market this year. But does any that you know make an offer like this?

Told to Millions

The Michigan features are being told to the millions, in the greatest advertising campaign of the season.



All men will know them. And the "40" buyers this year will look for cars like this. But such a car at such a price will not be found outside Michigan salesrooms.

These facts have been proved to hundreds of experts, in Europe and America. They can be proved to you.

We invite dealers and users to send for our catalog, and the facts which they wish to know.

MICHIGAN MOTOR CAR COMPANY, Kalamazoo, Michigan

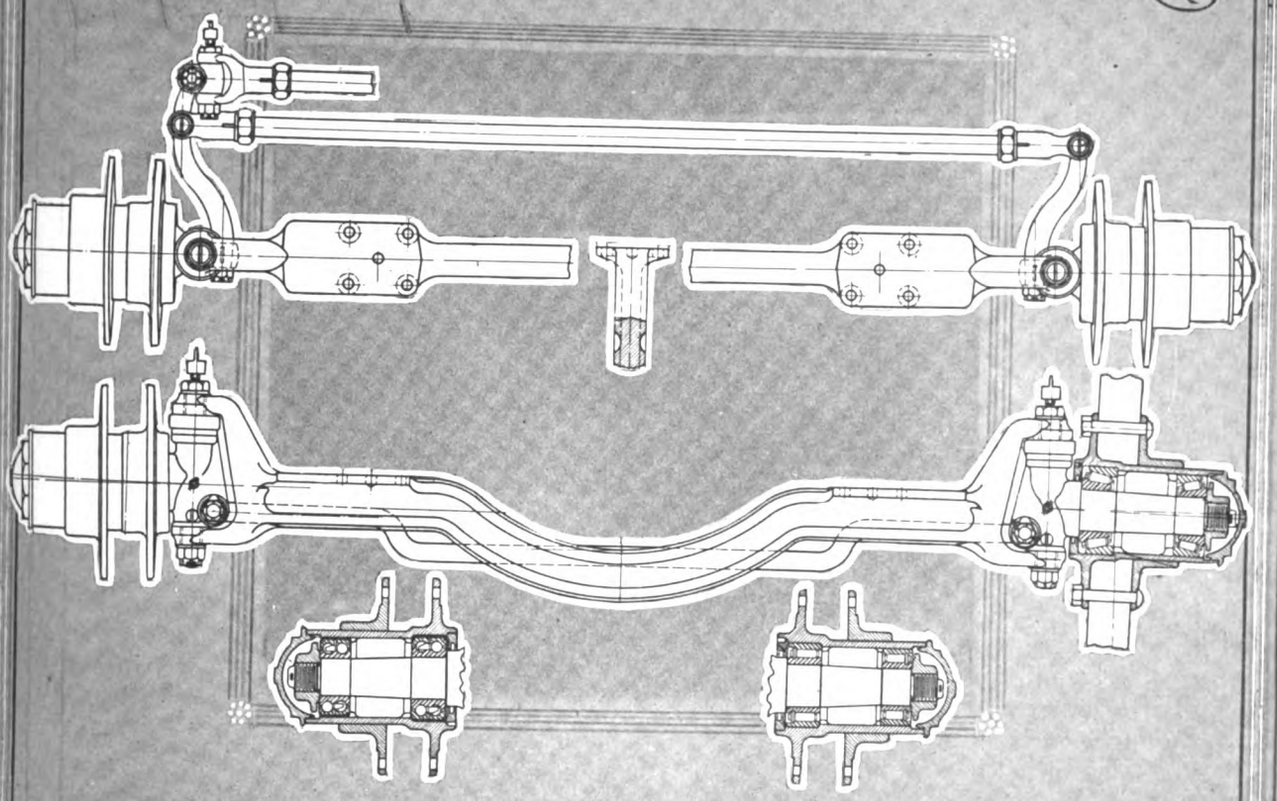
Four-forward-speed transmission
Oversize tires—35 x 4½
Electric lights and dynamo
Center control—left-side drive
Motor- 4¼ x 5¼
Extra effective brakes—16 x 2¼ ins.
Big, comfortable springs
Adjustable steering post
Adjustable pedals
Firestone Q. D. demountable rims—extra rim



14-inch Turkish cushions
Rear cushions 50 inches long
Hand-buffed leather upholstering
Best curled-hair filling
Wheel base, 118 inches
Nickel mountings
Large over-capacity, giving big factors of safety
Pressed steel, full-floating rear axle
Axles sufficient for an 80-horse-power car

Genuine cellular-type radiator
Best mohair top, side curtains and envelope
Windshield built in as part of body
Electric horn
$50 speedometer, 4-inch dial
Special foot rail
Swing robe rail
Rear tire irons
Complete tool equipment
Tool chests under running boards

There is such a difference of opinion about the various types of self-starters that we have not adopted any one type as regular equipment. We prefer to leave this selection to the buyer. We equip with either the gas or a positively efficient electric starter at moderate extra price.

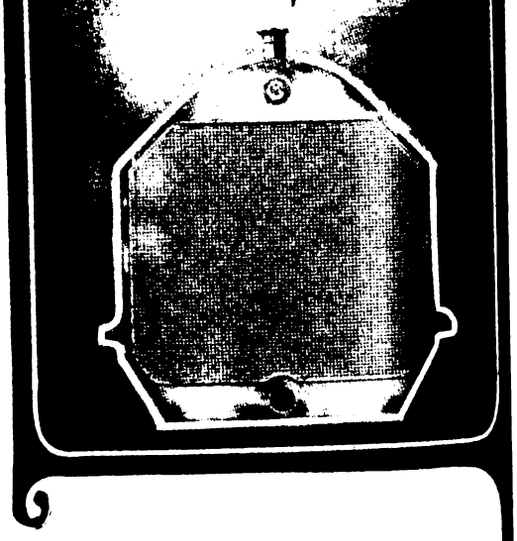
One of the SHELDON FRONT AXLES for Heavy Service

Another member of the famous Sheldon line, even more perfect than its predecessors—this is one of the Sheldon Front Axles for heavy service.

No better forging has ever been turned out in any plant. The spring pads are ample in area and are forged integral with the axle. This axle is not welded in the middle. The steering knuckles are reinforced to ensure greatest strength and safety, and perfect lubrication has been attained by efficient oil cups. We offer this axle to manufacturers with their choice of the following bearing equipment:



New Departure Double Row Annular
Standard Taper Roller
Bower Straight Roller
Rhineland Double Row Annular
Any standard double or single row annular bearing is interchangeable with these axles and hubs.

SHELDON AXLE COMPANY, Wilkes-Barre, Pa.

Skalout will prevent This

For Skalout will guard against an overheated motor and all its attendant troubles.

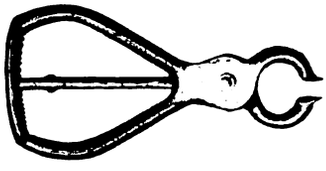
An overheated motor means serious loss of power and frequently, absolute breakage. If your overheating grows serious enough, it is liable to cause pistons to stick and fracture or cause the connecting rods to break or maybe injure the cylinder itself.

Overheating of the motor always injures the bearings or does some damage that means short life for your motor. Most car owners do not realize that their motors are overheating when they actually are. It is practically impossible to operate the motor without having scale deposited upon the inside of the radiator. This scale not only actually eats out the radiator but it retards the flow of water through the tube and being practically a non-conductor of heat, it renders the cooling system entirely inefficient.

Skalout is a very cheap, certain remedy for all these troubles.

Skalout has been proved by actual tests extending over years.

Skalout is quickly and totally dissolved in warm water and will not pass off in steam.



Skalout is not in any way injurious to your radiator, motor or any part of your car. It is absolutely deadly in its removal of scale and yet it is totally harmless in every other respect.

Your customers will appreciate your educating them along these lines.

Skalout is put up in packages to retail for $1.00. There is a good dealer's proposition in this for you.

HOW IS YOUR STOCK OF GILMER REPAIR PLIERS?

MOTOR WORLD

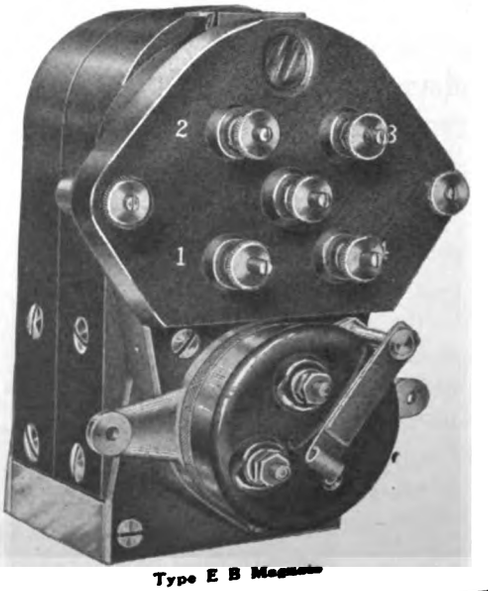
EISEMANN

EISEMANN products have always led because of their general all-round efficiency and durability.

Not because of any spectacular occasional performance, but because of steady performance, of the work for which they are designed, with greatest economy and highest efficiency.

Owing to the fact that a hot fat spark is possible with Eisemann products at an extremely low rate of speed, it is very easy for motors to be started on the magneto if that magneto be an Eisemann.

The Eisemann patented pole pieces are largely responsible for the extreme efficiency of the magneto for they insure the greatest possible volume and intensity of the induced current.



These patented pole pieces also provide for the greatest range of advance and retard. Throughout the entire instrument the most exacting tests are enforced both as to workmanship and quality of material used.

THE LONG HORN

$18.00

As Effective As the Lion's Roar

And Below is The JUNIOR LONG HORN $11.00

THE GREATEST AUTOMOBILE HORN VALUE EVER OFFERED

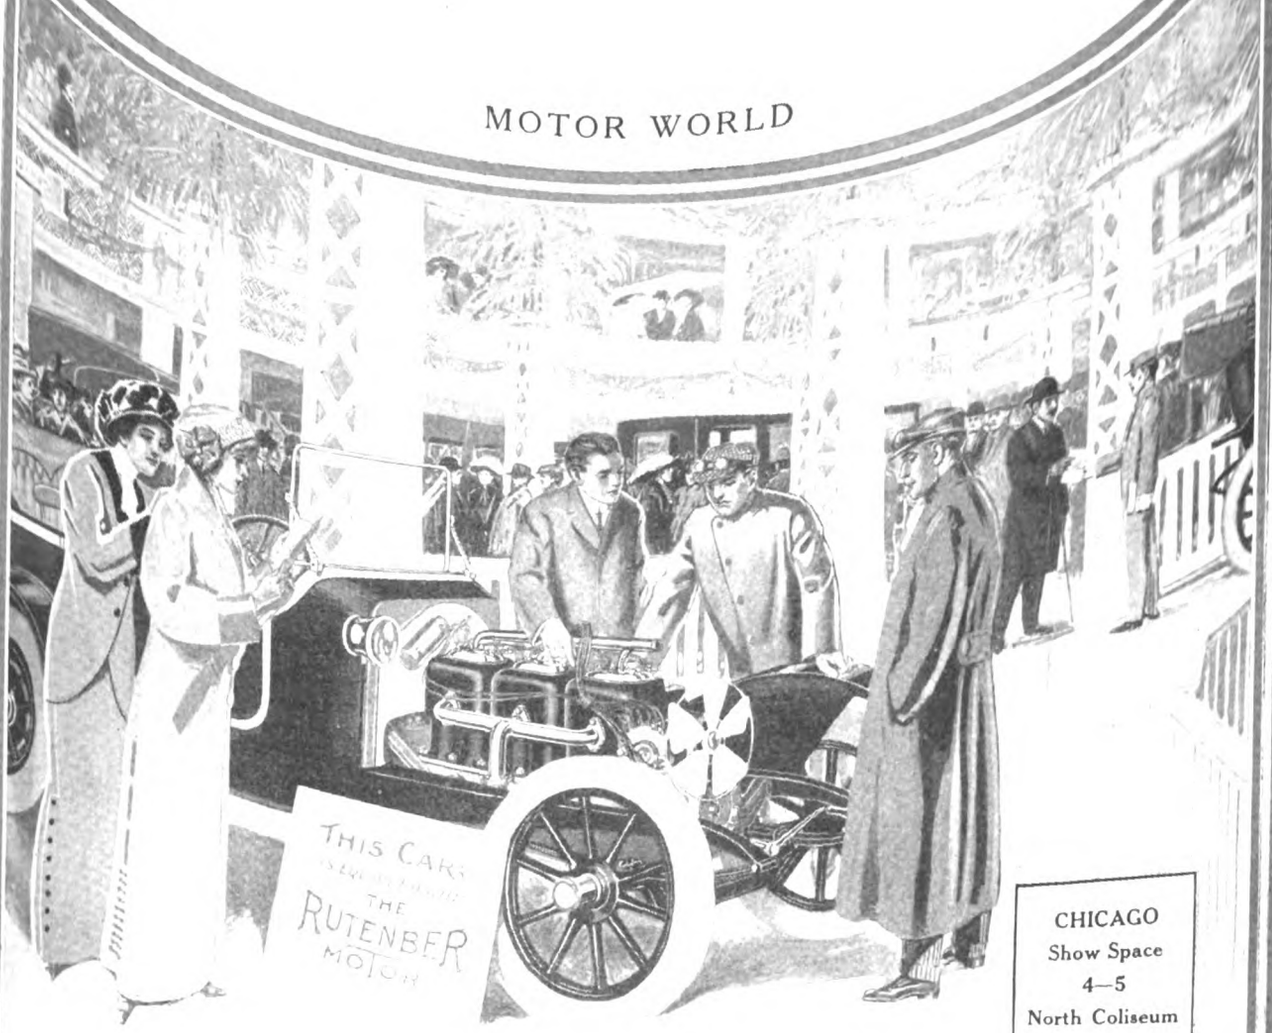
UNBREAKABLE

INSISTENT

LOUD

THE Junior Long Horn retailing for $11.00 is the biggest signal value ever offered the car owning public.

It is just a smaller edition of the well known regular Long Horn, shown at the top of this page, differing in size only and embodying all of the well known mechanical features of the larger type — same materials — same care in construction.



You, Mr. Dealer, can assure your prospective customer that the first cost of a Long Horn of any type, is the last cost, for this signal is mechanically operated on a high

The addition of the Junior Long Horn makes this the most complete line of signals manufactured, ranging from the Junior down to the smaller motorcycle type.

Dealers, investigate our proposition. Let us show you how immediately profitable the Long Horn line can be made to you and let us demonstrate through you to the trade its powerful, characteristic warning sound.

The Argument that Makes the Sale

THE consideration that determines which car your customer will ultimately select is no longer the superficial appearance of the cars he views. Showy bodies have sold many cars in the past but the cars that find readiest sale today are those which give in largest measure the assurance of motor satisfaction.

THE RUTENBER MOTOR

under the hood of any car, commercial or pleasure, is a guarantee of automobile efficiency. It has demonstrated by years of consistent performance that it will outlive the staunchest of bodies. It has a record unsurpassed for endurance, silent, uncomplaining service and economy of upkeep. It has made motor history and has built the reputation of many a car.

Model 28 Unit, Magneto Side.

The Rutenber Motor will be found in more than fifty of the leading cars during the coming year. Trucks, Ambulances, Fire Engines, Doctors' Cars, Touring Cars and all types of motor driven vehicles requiring the assurance of dependability place their reliance on Rutenber Motors.

Visit our exhibit, North Balcony (Coliseum) at the Automobile Show and talk with the representative of those manufacturers whose cars are Rutenber equipped.

Write for the Rutenber Book.

Warner AUTO-METER

The WARNER AUTO-METER

(Magnetic Type)

Is the ***"Dominant Speedometer"*** with both the makers and the owners of high priced American motor cars. Nearly all of the makers of high priced automobiles are now installing the Warner as "regular equipment" on their cars. In their catalogs and in their newspaper, periodical and magazine advertising you will find the name "Warner" displayed prominently in bold type. They want that name to catch the eye of the prospective car buyer. Makers of the highest priced cars specify the Warner in their advertising and install it on their product because they know that the class which purchases their cars—keen, well-posted, fastidious buyers—insist on the highest quality of equipment and will have none other than the Warner Auto-Meter. Owners of high priced cars are proud of the Warner Auto-Meter equipment because it has a reputation for highest excellence and in keeping with their standard of exacting requirement.

SPECIAL

We have arranged to place the splendid facilities of our Beloit factory at the disposal of automobile engineers for the purpose of designing new models of speedometers, with special installations and driving equipment adapted to meet the individual requirements of each special make of motor car.

For sale by leading dealers all over the world and at our branches listed below. The prices are never changed — never cut. They never vary. You pay the same price in one state as you would in another. Priced from $50 to $145, according to size and style.

The Warner instrument is ***made like a fine watch.*** It is a thoroughly jeweled instrument. The jewels used are ***select first quality Sapphires,*** accurate to 1-2000th of an inch and polished like a diamond. These sapphires insure absolute precision — for life.

INTERLOCKS

Prevent Blow-Outs, Punctures and

Double Your Tire Mileage

If you really believed this you would order a set of Interlocks for your car at once. We can prove our statements if you will give us the opportunity. Thousands of car owners are using Interlock Inner Tires with the most satisfactory results. A set of Interlocks will carry most any car one or two seasons (according to use) without tire trouble.

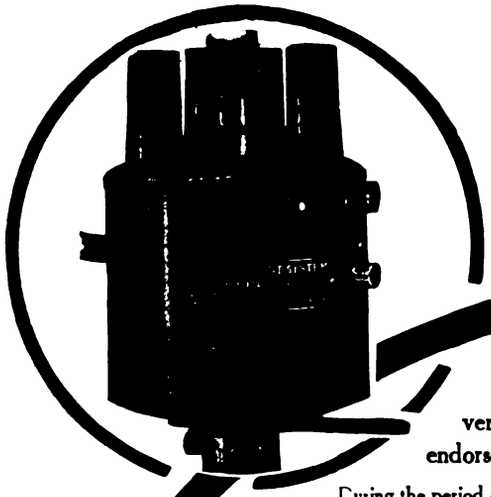
What Interlocks Are Interlock Inner Tires are complete endless inner tires (not inner shoes) quickly and easily placed between the outer casing and the inner tube. They strengthen the casing and protect the inner tube from punctures. The patented Interlock Flaps lock the Interlock securely, making it an integral part of the whole tire that flexes perfectly and cannot chafe, creep or heat. Interlock Inner tires will hold even if the outer casing is broken, and can be used in old or new tires. They double the mileage of new tires and add 1,000 to 5,000 extra miles to old ones. Interlocks have a fine gray rubber finish, are smooth outside and inside and have no troublesome ends, joints or edges to cement. Interlocks do not affect the resilience of your tires—are easy to insert and can easily be removed from one tire and placed in another.

Proved best by Road Tests Interlock Inner Tires have stood the exacting test of hard road work. Eight tires equipped with Interlocks have made over 7,000 miles each, a total of 56,000 miles, without a blow-out or any tire trouble. Interlocks used in tires that have gone 10,000 miles with the outer casings worn clear through have kept up with fast cars equipped with new tires and carrying extra tires. Interlocks have made a 4,500 mile cross country run—the last 1,000 miles over 20 mountain ranges without a blow-out or even carrying an extra tire. In the Four States Run Interlocks stood the test of hard fast road work under the critical observation of tire experts, without tire trouble. These and other hard public tests have proved the efficiency of Interlock Inner Tires beyond question.

90% of All Tires are Scrapped Before the Rubber Tread is Half Worn Out

because the fabric is not strong enough to resist hard road work, resulting in blow-outs, punctures, rim cuts, etc. The liberal excess fabric strength of tires equipped with Interlocks prevents blow-outs, punctures, etc., gives extreme long mileage, safety, and that freedom from tire trouble which every car owner desires.

Write for Our Booklet Send us your address and let us mail you our booklets, data and testimonials of users which are very convincing. Interlocks are sold by the best dealers everywhere. Ask your dealer about them.



To Dealers and Agents Any dealer can do a large business by telling car owners about Interlocks. We want a live dealer in every town, and give positive selling assistance. Write promptly for booklet and our dealers' proposition.

The Atwater Kent Ignition System

has been silently advertised from coast to coast by the best advertisement any product can have—the personal endorsement of over 100,000 satisfied motorists.

During the period of the magneto craze, we could have taken advantage of this fad and manufactured magnetos. Due to our facilities and prestige, we could undoubtedly have produced and sold large quantities of them. We knew, however, that the Atwater Kent System was fundamentally correct in principle and that it was better than any other ignition device. This opinion was also shared by thousands of our friends who discarded the magnetos on their new cars and installed the Atwater Kent, claiming they got much better results with much less trouble.

You can't equip your car with a more reliable ignition system than the Atwater Kent—no matter what amount of money you are willing or expect to pay for it. Why then take chances by investing in other equipment when by installing the Atwater Kent System you close every avenue to future regret?

Just a few of the many good features of the Atwater Kent System and its advantages over the magneto:

The spark is of constant heat quality irrespective of the speed of the engine, thereby enabling the engine to be run at a very much lower speed if desired.

The simplicity and accessibility of the different parts of the Uni-Sparker are much greater than in the case of the magneto.

The adjustment of the platinum contacts does not affect the timing of the spark.

Easy adjustment to lengthen or shorten the spark, thereby insuring the maximum economy of battery current.

Low maintenance cost and repair expense. Will start engine on spark. Duplicate ignition system not necessary. Light weight. No magnets to become demagnetized. Unlimited range of spark advance or retard. Low initial cost.

In connection with the standard Type F System, we are furnishing a new model—Silent Type K with automatic spark advance and insulated primary circuit, especially designed for use in connection with lighting and starting equipment.

PRICES OF THE TYPE F SYSTEM

	Standard Coil	Kick Switch Coil
1-cylinder	$17.00	
2-cylinder opposed	18.00	
2-cylinder distributor type	22.00	$24.00
3-cylinder distributor type	25.00	27.00
4-cylinder distributor type	25.00	27.00
6-cylinder distributor type	27.00	29.00

PRICES OF THE TYPE K SYSTEM

	Standard Coil	Kick Switch Coil
2-cylinder	$32.00	$35.00
3-cylinder	35.00	38.00
4-cylinder	35.00	38.00
6-cylinder	37.00	40.00

If you have an unsatisfactory magneto, or if your engine has no timer shaft, you can use the Atwater Kent System by means of a special "magneto gear mounting," the cost of which is $5.00 in addition to the above prices.

Possibly all that car of yours needs to give perfect service is an Atwater Kent Ignition System. Our booklet, "B," is as interesting as it's free—yours for the asking.

FEDDERS

Square Tube

Radiators

Water All Around

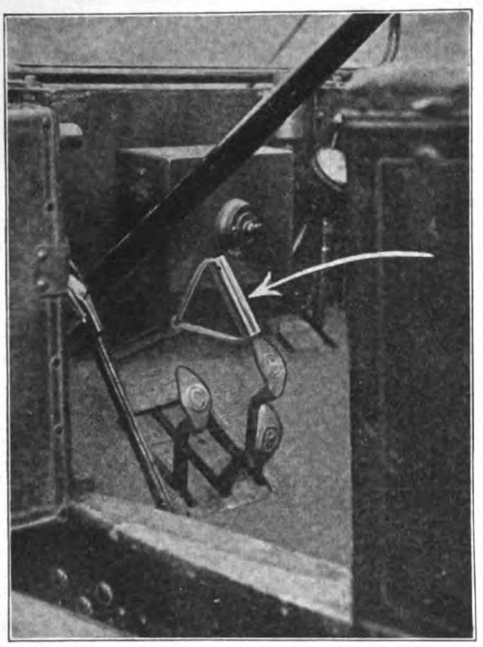
Repaired At Home

The water channels in Fedders Square Tube Radiators are vertical and horizontal, open on all four sides, guaranteed to give maximum cooling surface.

This form of construction is right and logical—a fact admitted and acted upon by engineers of many of America's best known cars—and in these days the wise manufacturer takes no chances of endangering the popularity of his car by gambling on parts of problematical value—more especially radiators.

Dealers who sell cars equipped with Fedders Radiators can repair broken tubes with a pair of tinner's irons. No expensive delays in returning to the factory.

Highest cooling efficiency, long life, easy repairs—this is the whole story of Fedders supremacy.



Note that while we specialize on Square Tube Radiators, we are also equipped to produce radiators of any type and in any quantity over specifications furnished. Get in touch with our engineering department.

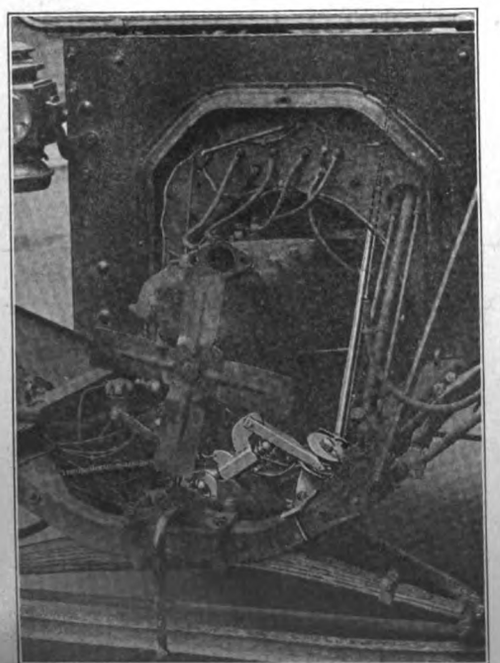
The Triplex Ford Engine Starter

How Are Your Ford Cars Started?

DO YOUR OWNERS STILL STRADDLE THE BUMPER AND CHURN THE CRANK?



You will give them this message if you appreciate the unequaled advantages of starting the Ford car with the TRIPLEX ENGINE STARTER.

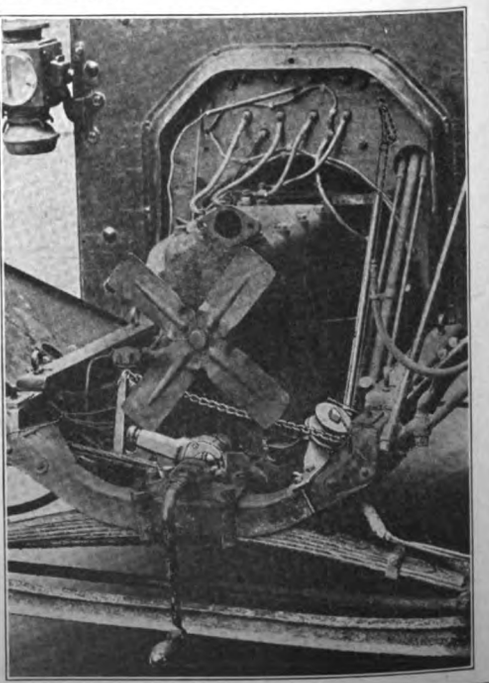
The TRIPLEX FORD ENGINE STARTER is a mechanical starter, which, of all types—compressed air, acetylene gas, electric and spring—is the only one on the market which at all times proves absolutely RELIABLE. In no respect is it a "Hit-or-Miss" proposition—working one minute and short circuiting or blowing out a cylinder head the next. It gives 100 per cent. uninterrupted service from the time it is attached. It comprises so few parts and is so simple and direct in application that it cannot get out of order, and it is as safe and durable as it is simple and effective.

You do not have to leave your seat to start the Ford Motor, WHEN EQUIPPED WITH THE TRIPLEX STARTER.

All that is necessary is to pull the lever. Will absolutely start the Ford 1,000 times out of 1,000.

Can be easily attached in one hour's time. Absolutely no holes to drill or mechanical work necessary to install same. Absolutely guaranteed to outlast the motor.

DEALERS: It doesn't require SALESMANSHIP to sell an ARTICLE for which every FORD OWNER is clamoring. Bring the TRIPLEX FORD ENGINE STARTER AND THE FORD OWNER together and a sale results.



Price $11.50

The Triplex GUARANTEE

The Triplex finishes the work the carburetor leaves half done.
The Triplex makes imperfect carburetion a mechanical impossibility.

Sixty Day Trial Proposition.

The Triplex is guaranteed to decrease fuel consumption 25%, increase power, prevent carbonization, prevent Back Firing, effect easy starting.

The Triplex will increase mileage, promote flexibility.

The Triplex will equalize the most uneven mixture that leaves the carburetor—make it uniform throughout.

The Triplex utilizes every drop of gasoline to its full capacity, making a saving of over 25% per gallon. It gives you five gallons of fuel at a cost of four. It makes high-grade gasoline out of low.

INSURE YOUR CAR Against Fire By Using a Triplex.

A back fire is impossible with a TRIPLEX, due to the fact that any flame is cut off before it reaches the raw fuel in the carburetor. Fire cannot pass through a TRIPLEX. The principle is the same as the non-explosive feature of the miner's gauze lamp.

The Triplex makes starting easier regardless of temperature or atmospheric conditions, and stops suction of live gasoline when the motor is cold.

The Triplex increases power proportionately. The full cylinder charge is ignited every time—the maximum power delivered at the point of highest efficiency. Because there is no fuel waste, there is no power waste. A TRIPLEX is a double economy—it INCREASES power at the same time it DECREASES fuel consumption.

The Triplex can be readily attached by anyone in one-half hour's time.

The Triplex is sold with the understanding that if it does not do as we claim we will gladly refund your money at the end of sixty days.

90 %
OF THE AUTOMOBILES DESTROYED BY FIRE ARE CAUSED BY A BACK FIRE IGNITING THE RAW GASOLINE IN THE CARBURETOR

The Gas Tank Patent Has Expired

The U. S. Circuit Court of Appeals, for the 7th Circuit, has just decided that the patent of the Commercial Acetylene Company has expired.

This leaves anyone free to manufacture and sell gas tanks of their own make.

But it does not give anyone permission to refill OUR Tanks. We have easily stopped this in many parts of the country, by order of the U. S. Courts. We shall now proceed to stop this practice everywhere.

Digitized by Google

Other companies are now free to get all the business they can legitimately on tanks of their own make, and free to re-fill their own tanks.

As to the future, it is evident that the whole gas tank industry settles down to the plain proposition of service.

You already know what Prest-O-Lite Service is.

CHICAGO ELECTRIC

The Chicago Electric

This luxurious equipage, without a peer in point of engineering excellence and classic beauty, answers a nation-wide demand.

¶ Here is an electric pleasure vehicle that commands the attention of every dealer in the United States, because of its superlative and distinctive qualities. It answers absolutely a nation-wide demand for an electric of the highest constructional efficiency and incomparable grace of body design.

¶ This Electric is the crowning achievement in the life of Frederick J. Newman, overshadowing all his past triumphs in electric car building.

¶ Behind this car stands an organization of noted Electric Car experts, each one of whom has attained notable success in this industry. These men have given their best thought and efforts to the Chicago Electric because they fully perceived the enormous possibilities of this perfect pleasure car. These same opportunities are open to the dealer who realizes the limitless field for an Electric of such pre-eminence.

¶ The Chicago Electric 1913 Models will be exhibited at the Chicago Automobile Show only. Our factory and sales organization are located here and we are thus enabled to do complete justice to our display.

The new cars are now ready for delivery.
We respectfully invite correspondence.

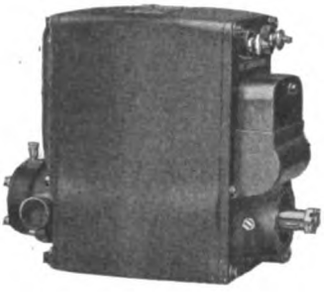
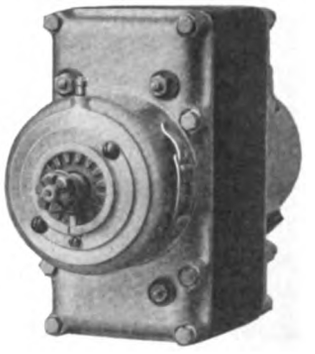
Westinghouse
Electric Starting, Lighting and Ignition



THE electrical starting, lighting and ignition systems on a number of the finest and best known cars this year will be Westinghouse built.

To be able to supply cars with electrical equipment that is backed by the experience of a long-established electrical manufacturer with large facilities like the Westinghouse Company has been the desire of every leading automobile manufacturer, and Westinghouse equipment will be one of the strong talking points of the new models.

Take a hint from the judgment of the manufacturers of these cars and see that the machine you purchase has Westinghouse equipment.



Combined Ignition and Lighting Generator

Lighting Generator

Starting Motor for High-power Cars

Combined Starting and Lighting Unit for High-power Cars

The equipments include: starting motors; lighting generators; combined lighting and ignition generators; and combined lighting and starting units; all standardized for different types of cars. All equipments are 6-volt systems.

Lighting and Charging

Westinghouse automobile generators automatically charge the battery without the use of any relays or solenoid-operated regulators. There are no adjustments to be made. The battery is at no time charged at an excessive rate.

The generator is slow speed, eliminating noise and wear.

Ignition

A high-power single-unit spark coil, acting in conjunction with timing and distributing parts on the generator, furnishes high voltage for the spark. The battery operating alone or with the generator supplies continuous power. The interrupter gives automatic spark advance. The spark is uniform, regardless of speed.

Starting

Minimum weight of motor and minimum discharge of the battery are features of the Westinghouse starting motors, permitting the use of a smaller charging generator.

A Westinghouse starting motor therefore means less weight to carry and fewer battery renewals.

Every Westinghouse Equipment is backed by the Westinghouse Guarantee

KLINE KAR

THE WAR IS ON CHOOSE YOUR WEAPON

FORTY $1,985

Mr. Dealer, will you enter the great automobile conflict that is sure to be waged throughout the whole country this year armored to meet and successfully repel all the thrusts and attacks of competitive concerns or are you satisfied to slide along the lines of least resistance and be a failure? Here is the secret of success—this wonder car, four cylinder, forty horsepower Kline, with electric starter and dynamo electric light, and four-speed transmission, at a price you would have named had you been the only one concerned.

The Boom of the Second Gun

FIFTY $2,585

A light six cylinder, fifty horsepower car, designed to meet and successfully negotiate all the requirements of six-cylinder construction. A car that is bound to leap into the good graces of the automobile buying public and remain there—a proven success. This car, electrically started and dynamo electrically lighted, with the economical four-speed transmission, now a feature of every machine in the Kline line, places Kline Kar dealers in the running no matter how strong the odds and allows them to emerge with colors flying.

Reinforced by the Thirty

THIRTY $1,750

You can flank your other movements and have a car of nominal horsepower—30 at 1200 revolutions—and with four cylinders excelled by none on the market at the price, with the past efficient Ever-Ready automatic starter as standard equipment. This car lacks in none of the details that have entered into Kline Kar success in the past and fortifies you and gives you prestige in the eyes of your prospect.

The Sixty Makes Victory Sure

The Kline Kar Master, Model 6-60, at $3500—a final word in motor car construction—seven-passenger capacity, big, roomy and comfortable; silent, speedy and reliable and excelled by none on the market in point of luxuriousness and beauty of design, completes a line that you cannot possibly pass without thorough investigation.

WE WANT MORE DEALERS TO SELL METALLURGIQUE

THE ARISTOCRAT OF EUROPE

The Car of Royalty

For Exclusive Americans

The Metallurgique propaganda is growing faster than we had anticipated—prejudice against the foreign car, just because it is foreign is disappearing, and our dealers are finding out that real European supremacy in matters of design, materials and lines is appreciated—and sought after.

Now, Mr. Dealer, we will be perfectly frank: The Metallurgique is the rich man's car. It is an automobile for the classes—for men of wealth and ability to discern the real difference in cash value between this swagger car of service and the very best American products.

It's just a question of steel versus steel—design versus design and appearance versus appearance. If you want strong, telling arguments on this controversy, write and we will put information into your possession that will help you sell the Metallurgique.

THE LARGEST AUTO SUPPLY HOUSE IN AMERICA

Our Name Is Your Guarantee

WHATEVER you buy from the house of CHAS. E. MILLER you may expect the fullest degree of satisfaction in every detail. Quality, quantity, material, workmanship, durability will be just right or we will make it right. Our name is your guarantee.

To buy from a house the size and standing of this one is the safest way to insure complete satisfaction in all your dealings. We handle goods of **standard quality only** and of course stand back of everything we sell.

No matter what you want in the line of automobile accessories or supplies, remember our slogan, "We Either CARRY IT IN STOCK, WILL GET IT—OR IT ISN'T MADE." One of the prize winners in MOTOR'S recent advertising contest selected this as the slogan out of the many shown. His reason was as follows: "This saying is the clearest possible statement of the Miller business policy which I have found to be a fact through several years of satisfactory relations with them."

Our Annual Catalog is the largest, most complete, up-to-date and authoritative dictionary of the auto supply market of any book published. It has come to be recognized as one of the standard reference works of the industry.

The total distribution of one hundred thousand copies of this catalog practically covers the world, at least wherever automobiles are used. Nearly all foreign as well as domestic automobile manufacturers and dealers, the offices of American Consuls, Public Libraries, Universities, Y. M. C. A. Schools, Publishers, Automobile Clubs, Engineers' Offices, Purchasing Departments—in all these places you will find a copy of the Miller catalog on file.

Fifteen branches spread over the United States, located in the principal motoring centers, bring Miller service within the reach of practically every motorist in the United States. Prompt delivery, perfect quality, honest prices—these are the things that distinguish Miller service and explain the marvelous growth of this pioneer establishment since its inception in 1896.

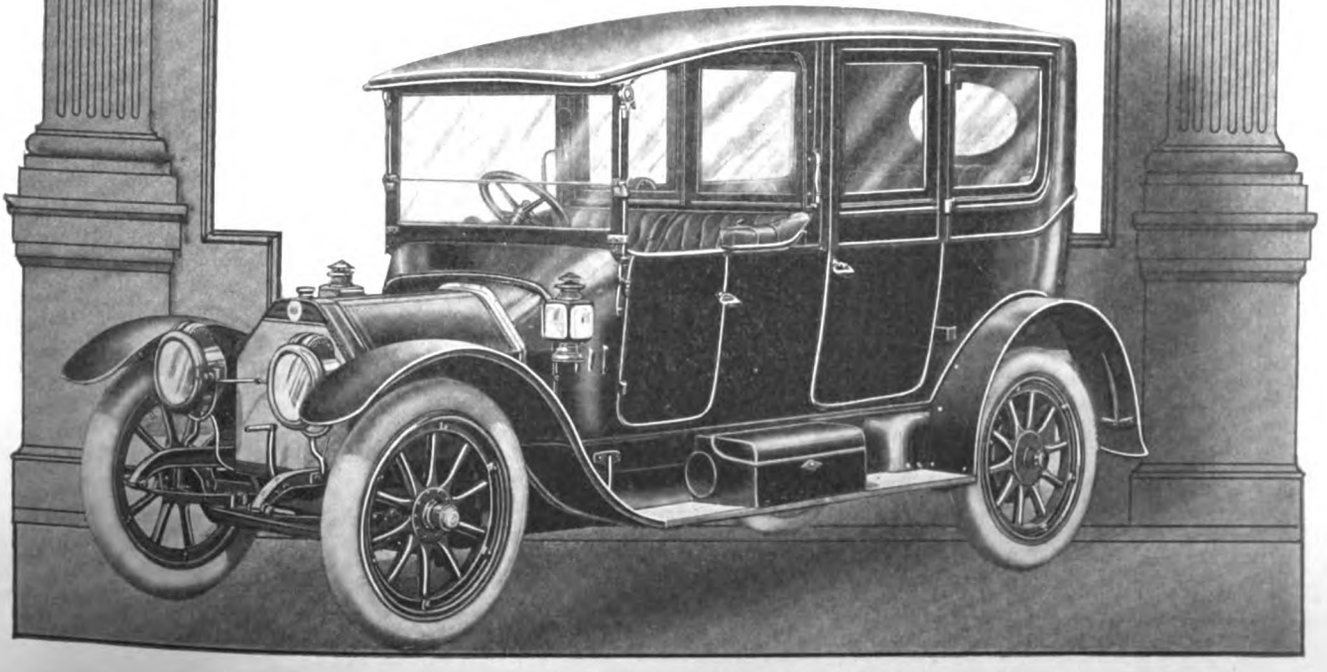
Lancia

AMERICA'S FAVORITE EUROPEAN CAR



LANCIA DEALERS KNOW

That there is a large and ever increasing buying interest developing in this country for the European car at American prices—but it is patent that the average foreign automobile is extravagantly priced on this side.

The Lancia is the one car to prove its actual European superiority over American cars of equal price—and this added value in strength, durability, silence and speed (coupled with its unusual lines) will make friends and customers for you, Mr. Dealer, among the elite in your territory.

We will show you, on demand, the finest selling arguments that ever surrounded a high grade car. Write and ask us to prove our contentions.

Women Influence the Sale of Your Car

VOGUE

Influences These Women

It is not surprising, therefore, that the leading automobile manufacturers should be using more and more space each year in Vogue to influence women of wealth and social position.

Is your advertising following the trend of the times as shown by the table below?

A new record making 2500 lb. Kissel truck

This new 2500 lb. KisselKar Truck is a distinctive innovation in commercial vehicles of this capacity. It is a genuine truck of solid and substantial construction from the ground up—heavy, high grade construction, such as has never before been put into a commercial truck of this capacity. It is the result of truck building experience and a careful correction of every known truck trouble. From the standpoints of design, construction, ability and price, **it has absolutely no competition.**

Motor—36 H.P., 4 cylinders cast in pairs, 4¼ x 5¼.
Unit construction, large, heavy Chrome Vanadium gears and shaft.
Frame of extra heavy pressed steel, the size usually found in 2-ton trucks.
Has foreign design spiral radiator which gives 50% greater radiation than ordinary types.
Radiator is protected by heavy aluminum casing and suspended on springs, greatly minimizing vibration.
Power plant supported at three points by spring suspension to give flexibility and further reduce vibration, and keep working parts in alignment.
Final chain drive and differential lock by which both drive wheels may be locked together on solid axle, preventing one wheel from absorbing power when spinning on ice, in mud or snow.
Speed controller which regulates the speed of the truck and not the motor.
Left hand drive and center control.
Big wheels, 38 x 5 tires, such as are usually used on trucks of double this capacity. This means economy and tire manufacturer's guarantee.
Demountable rims.
Extra large axles.
All levers, rods and joints of extra size.
Metal running footboard.
Two lengths of frames and wheelbase—8 x 5½ body and 10 x 5½ body.

DON'T FAIL TO SEE THIS TRUCK

In every point of design and construction this truck is superior to anything of like capacity ever built. It is the new, big feature of the truck field.

See These Dart Trucks
At The Shows

THERE'S a revelation in auto trucks awaiting you at the New York and Chicago Shows. The new 1913 Model Dart Trucks—triumphs of engineering skill and made to sell at exceedingly moderate prices—will be on exhibit for the inspection of truck users and dealers.

The money-making opportunities which these trucks offer to dealers and users are so tremendous as to be positively remarkable. If you intend to visit either of the shows let your attention center on the Dart exhibits and let us explain to you our 1913 proposition.

Prices That Shatter Traditions

We've shattered to atoms the tradition that a substantial, well-built truck with liberal specifications **had to** sell for $3,000 to $5,000. The new 1913 Dart Trucks at $1,100 and $1,800 include more *actual, tangible* value than can be found in any other truck of the same capacity in the entire world. They set a *new standard of value*. They embody all the meritorious points gleaned from twenty years of experience. The liberal specifications will amaze you.

A Remarkable Test

The wonderful performances of Dart Trucks are significant of their exceptional construction. In a recent hill climbing test a Dart truck carried a full load up Giant's Despair Mountain at Wilkes-Barre, Pa.—a grade of 37½%. This performance indicates the efficiency of the Dart—its wonderful durability and power.

Three Models for 1913

The 1913 line of Dart trucks comprises these three classes—each a remarkable value:

Model ED 1000 lb. capacity (2 cyl).....$ 750
Model B 1000 to 2000 lb. capacity (4 cyl.)..... 1100
Model C 2000 to 3000 lb. capacity (4 cyl.)..... 1775

Steel wheels with Goodyear, hard rubber base tires furnished on Models B and C for $100 per car extra.

Complete specifications and detailed information about our 1913 proposition can be obtained at our exhibits or by writing us at the factory.

Dart Trucks will be Exhibited at the Following Shows:

NEW YORK
Grand Central Palace—Section 42A

CHICAGO
Coliseum Annex—Space Q1

Quick Sales---Big Profits

For You Mr. Dealer

You know what it means to have a lot of slow selling accessories on your shelves. Then you will be interested in the money-making sales plan back of the MARVEL STEAM VULCANIZER, the easiest and best selling vulcanizer on the market. Many dealers are making big money selling the

Marvel Steam Vulcanizer

The Only Automatic Steam Vulcanizer Made

The Marvel is the only steam vulcanizer that is absolutely automatic in its work. It uses either alcohol of gasoline. Being the lowest priced steam vulcanizer made, it is therefore the best seller.

The Marvel Steam Vulcanizer can't burn or scorch the rubber. Steam heat **cures.** Dry heat **crystallizes** rubber. You know this. Your trade knows this. Vulcanizing that does **not** cure is worse than none.

The Marvel Vulcanizer embodies the same principle as that of the large vulcanizing plants. It's logical, right and saves tires. The Marvel should not be confounded with the ordinary electrical, alcohol or gasoline heated vulcanizers.

If you are interested in making money through quick, easy sales, fill out the coupon attached or write us a letter asking for our sales plan, terms and a sample vulcanizer. We'll send one free, express charges prepaid, so you can try it and see for yourself how easy the Marvel sells.

THE MARVEL AUTOMOBILE SUPPLY CO.,
Cleveland, Ohio.

Gentlemen: Without cost to me, please send me by express, charges prepaid, one Marvel Steam Vulcanizer to try for 30 days. Also send me your dealer's proposition, showing how I can increase my profits on vulcanizers.

CUBIT

ELECTRIC HORN

$3.00

A Good Horn at a Low Price.
In Black Enamel, very High Gloss.
Weighs Two Pounds and a Half.
Consumes very little current (1½ to 2½ amps.).
Emits high toned Musical Blast.
Has no working parts to get out of order.
Has no VIBRATOR, the diaphragm is the Armature.
Requires no Oil. Runs on SIX VOLTS.
Gets better with age as the "Bulging" of the diaphragm which is detrimental to other horns makes the "CUBIT" more efficient.

Hupmobile

Six Passenger "32"
$1175 F. O. B. Detroit, has equipment of two folding and revolving occasional seats in tonneau, foot rest, windshield, mohair top with envelope, Jiffy curtains, quick detachable rims, rear shock absorber, gas headlights, Prest-O-Lite tank, oil lamps, tools and horn. Four cylinders 3¾-inch bore and 5½-inch stroke; 126-inch wheelbase; 33 x 4-inch tires. Standard color, black. Trimmings, black and nickel.

"20" Runabout, Fully Equipped
$750 F. O. B. Detroit. Four cylinders, 20 H. P., sliding gears, Bosch magneto, top, windshield, gas lamps and generator, oil lamps, tools and horn.

"32" Touring Car or Roadster, shown at right of six-passenger "32," fully equipped, $975 F. O. B. Detroit.

The "32" Coupe

A distinguished addition to a distinguished line

First View, New York Motor Show, Jan. 11-18

In exterior appearance the Hupmobile Coupe is as unobtrusively unique and as well-balanced as the other models of the "32" type.

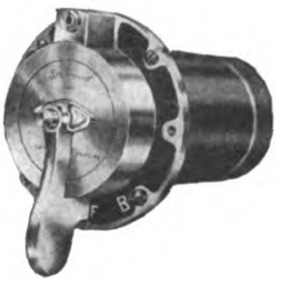
In interior finish and appointment, it is rich and luxurious—imported Bedford Cord upholstery, with side walls to match and ceiling done in heavy satin; with right-hand control and room for three adults in comfort.

The coupe rounds out the line of Hupmobile pleasure cars, which now includes two touring models and a roadster, all built on the same sturdy "32" chassis, and the well-known "20" Runabout.

The entire line will be displayed at the New York and Chicago shows.

Inspect the cars there, at any other shows or at the dealer's; and you will see why we believe the Hupmobile to be, in its class, the best car in the world.

Hupp Motor Car Company
1254 Milwaukee Ave. Detroit, Mich.



Three Passenger "32" Coupe
$1350 F. O. B. Detroit, including equipment of electric lights and 100 ampere battery, electric horn, speedometer with clock, extra wide seat for three passengers, 54 x 22 inches; quick detachable rims, 33 x 4-inch tires, rear shock absorber. 106-inch wheelbase. Standard color, black. Trimmings, black and nickel.

SPLITDORF

"Always There"

The non-vibrating "T S" SPLITDORF COIL—the latest and most finished of all types of coils, is notable in that it is equally effective with all the newer, as well as older models of the famous SPLITDORF low tension system.

Its neat appearance on the dashboard, with kick switch, ignition button for battery connection and lock and key for the whole operation, is only in keeping with its real effectiveness and durability.

Enclosed in a light waterproof case extending through the dashboard, it has an electrical construction that makes its firing qualities with any engine unsurpassed by any other coil. The coil proper being mounted on the base of the switch, the connecting leads from the switch contacts to the coil are very short while the terminal wires from the coil and battery and magneto leads are brought together in a neat and compact installation.

The SPLITDORFLITE electric lighting generator is the smallest, most compact and only self contained generator on the market. It specially lends itself to instalment on machines not designed for a lighting outfit and can be installed on any make of engine of almost any model.

A positive source of illumination, spotlessly clean, unaffected by weather conditions, the SPLITDORFLITE once properly installed ends an owner's lighting troubles for all time.

SPLITDORF IGNITION devices, including MAGNETOS, PLUGS, COILS, as a matter of fact, should be specified with every form of hydrocarbon motor. We will gladly shoulder all responsibility for any change over to our superior system and guarantee the greatest satisfaction.

If interested in any form of ignition for gasoline motors just write in for our free literature. Our new catalog, our "Racing Record" or our "New Lights For Old" is yours for the asking. Do it TODAY.

THIS is the non-skid tire that is given preference by tire users who have passed through the school of experience. The Federal Rugged Tread is a non-skid tire that effectively overcomes the difficulties of winter motoring.

FEDERAL
RUGGED TREAD
TIRES

The rugged build and extra thick tread of Federal Rugged Tread Tires make them unusually economical and lasting in service.

The heavy base studs firmly **grip the road**, giving full power traction under all conditions.

When you next purchase tires, specify Federal Rugged Tread.

Made in Clincher, Quick Detachable Clincher and Straight-Wall (oversize and non-rim-cut) types.

Federal Tires are procurable at leading dealers and auto supply houses.

A Steel Truck Body Is a Strong Truck Body

Steel is synonymous with strength. When man wants to build strongly, securely and well he fashions his product of steel. Thus we have steel bridges—steel buildings—steel cars.

Budd Motor Truck Bodies are made of steel. Hence they are strong bodies—practically indestructible bodies—proof against wear and tear. They represent business economy—sturdiness—stability—service and safety as well. They prove the truth of the slogan: "A Budd All Steel Body on your truck today eliminates body repair bills tomorrow."

BUDD All Steel BODIES

represent the last word in the art of truck body building—the height of truck body efficiency. They will not crack and warp. They cannot split and rot. They eliminate fire risk entirely and being light in weight are relatively easier on tires.

They are made of a special, patent, leveled, open hearth steel worked into shape by special machinery and made by the exclusive Budd process.

All joints are carefully welded. All seams are concealed. Thus a perfectly smooth surface is produced which guarantees a finish of the very highest character—a finish that is "oven baked on" at a higher temperature than is possible with wood—a finish that practically becomes part of the steel itself and insures the maximum wearing qualities.

All corners are round. No dirt can accumulate. Each type of body can be readily flushed with water, and—as absorption is impossible perfect sanitation is assured.

Yet with all its manifold advantages the Budd All Steel Body actually costs no more than a first class body of wood.

You may be a manufacturer of commercial vehicles or you may intend to purchase a truck—whatever your business, however, it will pay you to investigate the Budd All Steel Body today. We have some facts upon all steel body construction that will be of vital interest to you. Write for it now.

Budd All Steel Bodies can be made in any design and in any desired capacity. We'll gladly furnish estimates.

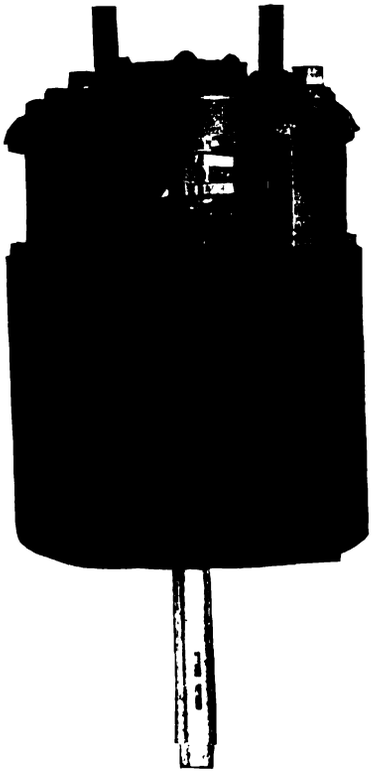
ELECTRIC STARTER



The Auto-Lite 6 Volt Electric Lighting and Starting System

EFFICIENT and SAFE

Has more torque and will crank your engine with more speed than any other system on the market of equal weight.

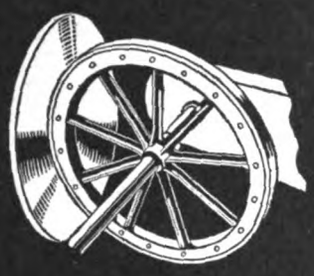
100 per cent. efficiency. Not a make shift for any car. But a distinctive application for each manufacturer, insuring positive results.

First---The system consists of a powerful 6 volt series wound motor.

Second---Of a simple lighting generator with large capacity. Of few parts and built rugged for automobile usage.

Third---A rugged simple starting switch operated by foot pedal.

Fourth---An ammeter which shows both production and consumption of current.



This system is not an experiment as there are thousands in use. We guarantee deliveries, efficiency and service. Insist upon an Auto-Lite system on your car.

The Gearless Transmission!

Cartercar's 10th Year Of Success

Model 5-A
Completely Equipped
$1700

Made Good—Under every possible condition the Cartercar has answered every requirement of the most particular drivers. No matter whether the roads have been hilly, sandy or muddy the Cartercar has always given service—the best service.

Few Changes—And during this long period of success and ever increasing popularity, the big feature of the Cartercar—the Gearless Transmission—has practically remained unchanged. It is the feature of the Cartercar which is largely responsible for the extreme reliability and greater efficiency.

Power Economy—This transmission utilizes the power so completely, that the Cartercar will easily carry a full load up a 50% grade—and through deep mud and sand. No gear car can give such valuable service. You take the roads just as they come.

Unlimited Speeds—Another splendid feature of this transmission is the unlimited speeds—all controlled easily and silently with a single lever. There is nothing to confuse the most inexperienced driver.

Greater Tire Mileage—Many Cartercar owners say that they get about twice the usual mileage from their tires. This is because there are no jerks nor jars. You can easily see that this must also mean the utmost comfort.

Electric Starting—A system of electric starting and lighting that has proven 100% efficient under all conditions is employed in the Cartercar. You merely press a small knob to crank the motor. Turn the same knob and you light all or as many of the lamps as you wish.

Compare Prices—When you consider the prices of the Cartercars you should also consider the much greater advantages which it offers. A Cartercar will give the most perfect service over all roads—for any driver—and every day in the year. See these splendid cars before you buy.

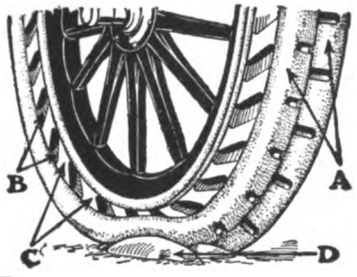
Owners of Pleasure Electrics:

Don't Let Tires Annoy You

No use of it—not a particle. You can have tires on your electric that will never bother you—tires that won't puncture, or blow out or skid—tires that make your car most comfortable and that protect its delicate mechanical parts.

And with these tires come greatly lessened upkeep—the end of tire repairs—the end of carrying a fifth tire—the end of frequent replacement. (The Motz Non-Skid Cushion Tire is guaranteed for 10,000 miles, one year.)

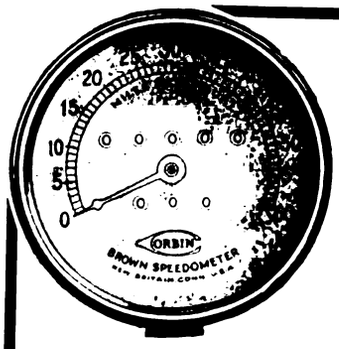
This tire is in no sense an experiment. Four years have proven its worth. It is far the most popular tire now used on electric cars. Every leading electric car maker now includes the Motz as standard equipment. In two years the demand for this tire has multiplied 10 fold.



All due to the extra quality and quantity of rubber and the patented construction (note the double, notched treads; the undercut sides; the slant-wise bridges).

USE TROUBLE-PROOF
Motz Non-Skid Cushion Tires

Whether you are buying an electric, or tires for an electric, be sure to investigate the MOTZ. Thus you'll end all tire annoyance and greatly reduce your tire bills.



These tires are easily applied to any standard clincher, universal quick detachable or demountable rim.

A postal, sent today, brings our latest Tire Book 58, by return mail.

THE MOTZ TIRES & RUBBER CO.
Akron, Ohio.

You can read it from the rear as well as from the front seat.

The clear and distinct marking of the dial, and the absolute rigidity of its pointer are invaluable features of the

CORBIN-BROWN SPEEDOMETER

insuring easy and accurate reading, no matter how fast your car may be traveling.

Absolute accuracy is assured by mechanical simplicity.

The entire mechanism practically consists of two compound governors.

There are no delicate or complicated parts to jar loose or to allow the instrument to grow inaccurate and worthless. Registers low mileage just as accurately as high.

Calibrated by hand. Built with precision of a high-grade watch.

On sale by leading jobbers and accessory dealers everywhere. Write today for catalogue.

They Add Little to the Cost—but Much to the Car

The valve stem is not an important item in the **cost** of the car.

The best valves cost, at most, only a few cents more than the inferior ones—and this means little to the man who makes the car.

But to the man who buys the car it often means the difference between a smooth running, powerful machine and a troublesome, unsatisfactory one.

Loss of power and consequent waste of gasoline and noisy, clattering motors are common troubles that are often traced back to cheap valve stems.

We have found in years of experience that there is a right way to make the valve stem for every motor. The heads are made from material which will not warp in the terrific heat and which the gases will not pit or corrode. The stems are made from stiff carbon steel which stands the action of the valve mechanism better than any other material.

Send blue prints of the valve stems you use and particulars concerning them. Let us tell you what they would cost, ground, finished and ready to seat.

The Electric Welding Products Co.
CLEVELAND, OHIO

BENZ

Since the introduction of BENZ cars to the motoring public of America no car has attained such world-wide supremacy as to its construction, standing up quality, and material. The new type of 35 and 50 H. P. BENZ models are the last word in automobile construction.

The noticeable features of this type of BENZ cars include the offset crank shaft, smokeless oiler, and SILENT CHAINS instead of timing gears.

The BENZ Carrosseries are noted for their beautiful lines and thorough comfort.

To those desiring AGENCY of this car the Benz Company will offer special terms. We want RELIABLE, ENERGETIC agents to further our interests for both BENZ pleasure cars and BENZ-GAGGENAU trucks, which today stand recognized by those who know, as the leading 6-ton truck. Wire or write us, no matter where you are.

Our PRICES compete with LEADING AMERICAN makes.

"In Exchange for your empty tank, accept only a genuine Presto-O-Lite Tank, filled with genuine Prest-O-Lite Gas."

This is the message that is going to Prest-O-Lite users everywhere.

In it there is a hint for the wise dealer, as well.

You know that no imitator of Prest-O-Lite has ever sucessfully imitated Prest-O-Lite Service.

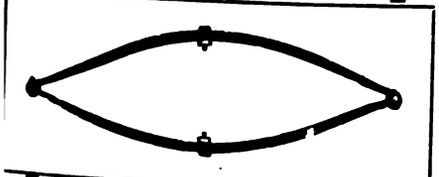
You also know that no imitator ever made good the large claim "more gas and better gas than Prest-O-Lite."

So does your customer.

Imitations are getting harder and harder to sell. There are now mighty few dealers trying it.

Most of those who yielded to the old but ever tempting claim "More Profits" have come back home.

To the dealer who is still trying to force imitations on people who won't have them, perhaps because he has money tied up in them, we can only say:



"The sooner you resume earning your good old Prest-O-Lite profit, the sooner you will make your income what it used to be."

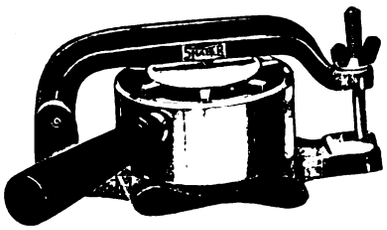
Penn Springs



Penn Spring Works

BALDWINSVILLE
NEW YORK

PENN SPRINGS are tested for resiliency and tensile strength far beyond any point that could be reached in every day service. They are guaranteed against fatigue and through the special grades of steel and methods of construction they will give service "plus."

Car manufacturers can make our engineering force part of their organization in the work of producing springs that are true in even load carrying, resilient and engineered to fit the particular car for which they are designed.

Digitized by Google

DEALERS: A million motorists will have tire trouble in 1913. There is a demand for a **reliable,** inexpensive vulcanizer that can be used by anyone, anywhere—a vulcanizer that will mend tube punctures as perfectly as the most elaborate plant.

VUL CANIZER REPAIR KIT $2

The only inexpensive vulcanizer that actually **vulcanizes** a repair clear through because it is the only one in which the vulcanizing temperature is maintained long enough to cure the raw rubber. Its ever-present fuel, gasoline, is converted into a gas by the patent generator which distributes the flame over the vulcanizing surface at just the right intensity

Other exclusive Shaler features are a handle that is cool enough to permit moving the vulcanizer the moment the repair is finished, asbestos plate inlaid in tube shelf to retain heat and prevent pinching tube, and universal clamp insuring even pressure to all parts of a repair.

A real SHALER Vulcanizer

Not an experiment, but the product of the largest exclusive vulcanizer manufacturers in the world. Sold under the Shaler guarantee which has made the Shaler line of vulcanizers for motorists and repairmen the standard throughout the auto industry.

Get our trade proposition

Write today and get full details and trade prices on this indispensable accessory. Sooner or later every motorist will get a VUL-KIT from someone.

C. A. Shaler Co.

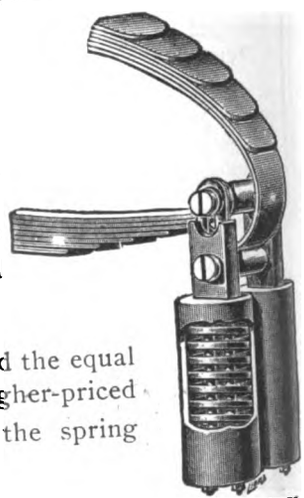
ALMOST UNIVERSALLY USED IN FRANCE — SHOCK ABSORBER — THE RAGE IN ENGLAND

TRADE MARK

50,000 sets sold in Europe alone

in two years after the J. M. made its debut!

United States girdled in one year—



you see the J. M. on high grade cars the country over.

Why?

Because the

J. M. Shock Absorber

has been silently advertised everywhere—by the best advertisement any article can have—personal endorsement of satisfied users.

Because the J. M. does really make riding a comfort; does really reduce tire expense; does really minimize engine wear—by holding the rear wheels on the ground, despite rocks, ruts, and "thank-ye-ma'ams."

The ***Ford J. M.*** makes a Ford the equal in riding qualities of much higher-priced cars—does not arrest or lock the spring action.

See the J. M. at the Madison Square Garden Show. Basement space 658.

Send for our new descriptive booklet "W," and state the make, model, weight, type of body and width of rear springs of your car—so that we may suggest the type of J. M. that is perfectly fitted to your needs.

BOYCE MOTOMETER PAT'S PEND'G

1913's TRADE SENSATION

Know the Exact Heat of Your Motor While Driving

(Front view ½ actual size.)

The Motometer is a watchlike instrument fitted to the radiator cap, protecting the motor from damage caused by improper lubrication, overheating, defective cooling, etc. By means of a red fluid indicator it warns you.

When the Radiator Needs Water

When Oil Supply Is Insufficient

In short, it tells whatever excessive heat tells—a broken water pump, a clogged pipe, a broken fan belt, etc., and tells before the damage is done.

Attached the same as an ornament, readily visible from the seat day or night. It will prevent frozen radiators in winter and cracked cylinders in summer.

Finished in black enamel with gold plated or nickel rims.

The Motometer Company, Inc.

904 U. S. Rubber Bldg.
Broadway and 58th Street, New York

Remy Magneto

Chosen by America's Leading Manufacturers

More Remy Magnetos are being used on 1913 American Automobiles than all other makes combined.

Our contracted sales for 1913 are Five Times Greater than in 1912.

We ship over 13,000 Remys monthly.

This is an expression of the confidence of this country's foremost manufacturers in Remy Magnetos and the facilities of the Remy plant in Anderson, Indiana.

See that a new Remy is on the car you buy.

Exchange your old magneto (any make) for a new 1913 Remy; it will cost you practically no more than repairs on your present ignition system.

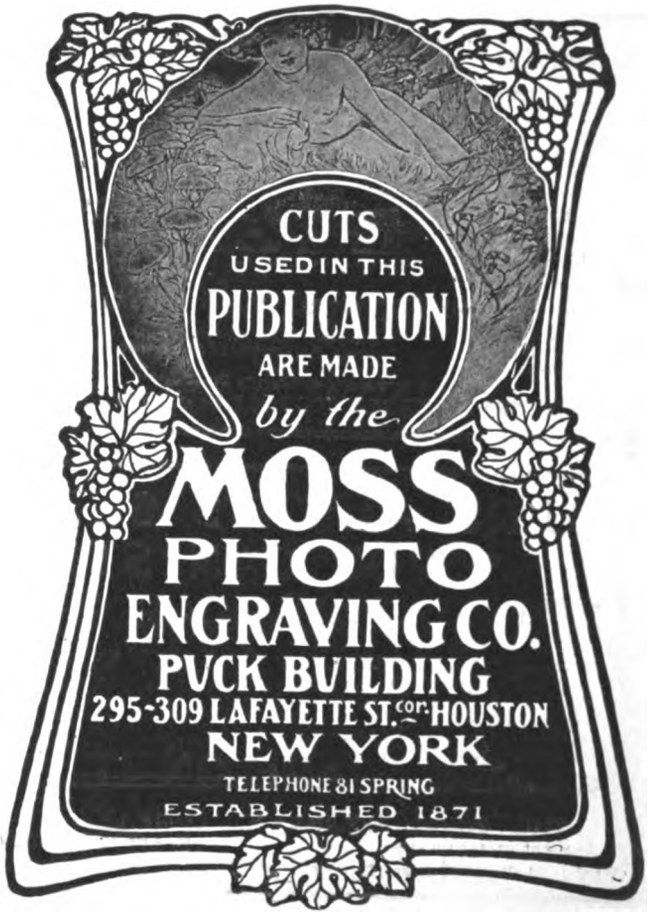
If You Need Motor Lamps



You Need This Catalog

We want you to write for the Solar Catalog before you decide on your motor lamps, for this is the most complete line of lamps on the market. Solar Lamps have been preferred by most motorists for the past fourteen years because of their brilliancy, their style, their strength and their several exclusive advantages—their special short focus lead glass lens mirror reflectors—the patented double ray light projection (in the Solarclipse), giving two distinct fields of light, for city and country use—the new black finish, the only such finish that's proof against heat and moisture—and other features that other lamps lack.

To fail to see Solars before you buy is to fail to include in your consideration the very finest lamps in existence. Solars are made for oil, electricity, gas and in combination, for pleasure cars, motor trucks, carriages, motor boats and airships. Write for catalog now—while you think of it. (136)

Weed Chains
The Great Anti-Skid DEVICE
Nine-tenths of all accidents to automobiles are caused by skidding or slipping.
Either you skid into the "other fellow" or the "other feilow" skids into you.
No matter how careful a driver you may be, you cannot prevent skidding or slipping on wet, muddy snow-covered roads or on icy, slippery greasy pavements unless you equip your car with Weed Chains.
Cannot Injure Tires
Because They Creep
An absolute necessity on both rear wheels and if you want to know what real steering steadiness means put them on the front wheels too.
For your own safety—for the safety of the public, fully equip your car with Weed Chains. Make it your business to get a set today.

STUDY the illustrations! They show how you can double the efficiency and profit of your heavy service truck.

The upper cut shows the "traction" wave always formed in the ordinary continuous tire under heavy load. This wave, caused by the bulging of the rubber, works into the base and tears the tire from its fastenings. It can't be avoided in any ordinary way. Then, too, this wave forms a constant hill—the tire is always climbing, retarding progress, reducing power efficiency.

Showing traction wave in ordinary continuous tire. (A) indicates where wave forms. (B) indicates base where roll and tread separation occur.

Contrast this condition with the profit-making worth of—

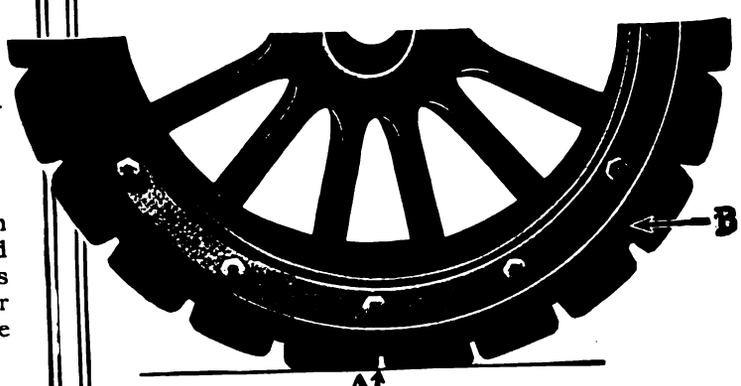
Firestone

Continuous Base—Notched Tread

Truck Tires

The lower cut shows how the Firestone Notched Tread overcomes the wave, by preventing its formation. This is *not* an individual block tire, with tread-tearing, metal-retaining plates. The Firestone continuous base is of the same tough, resilient compound as the tread. These tires hold the road, increase traction, absorb all vibration.

Get the full facts. They mean Economy and Increased Profits.



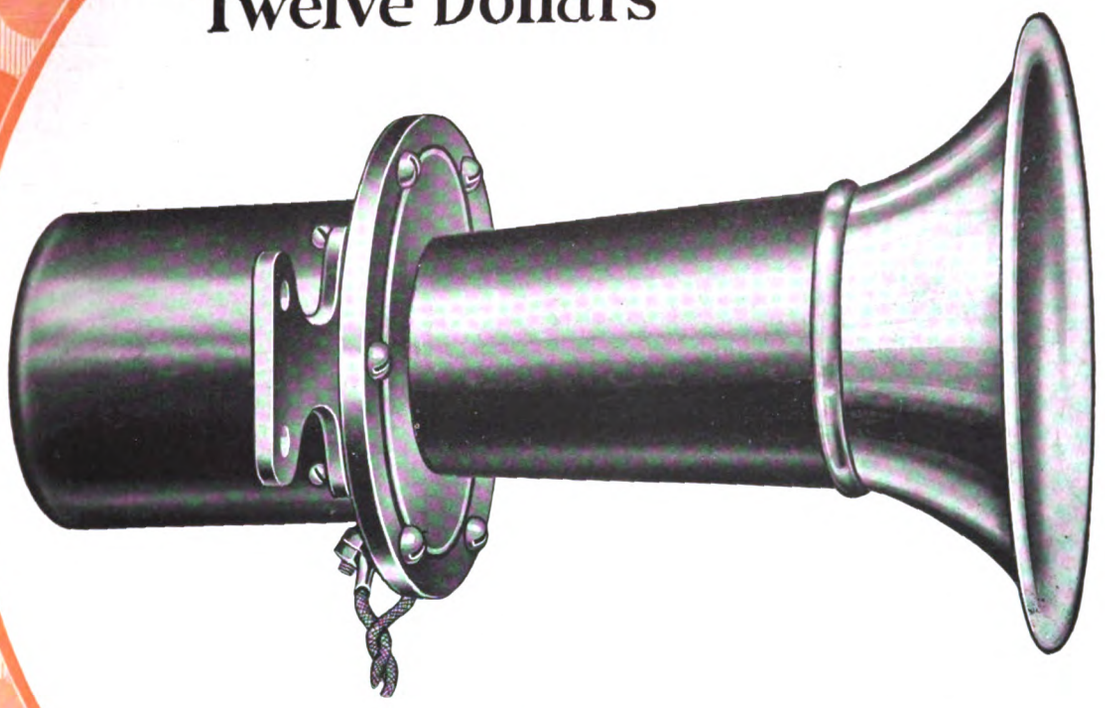
Firestone Truck Tires for Every Type of Car, Every Load, Every Road Condition

The Firestone Line of Truck Tires has in it the tire, solid or pneumatic, you need for your particular service. Get the books which tell the story. Ask, as well, for Quick Removable Rim facts. They are valuable.

The Firestone Tire & Rubber Co.

"America's Largest Exclusive Tire and Rim Makers"

Akron, Ohio—Service Stations Everywhere



Showing how Firestone Notched Tires overcome destructive traction wave. (A) indicates wave passing off into space between blocks. (B) indicates continuous base—assuring absorption of vibration in every direction.

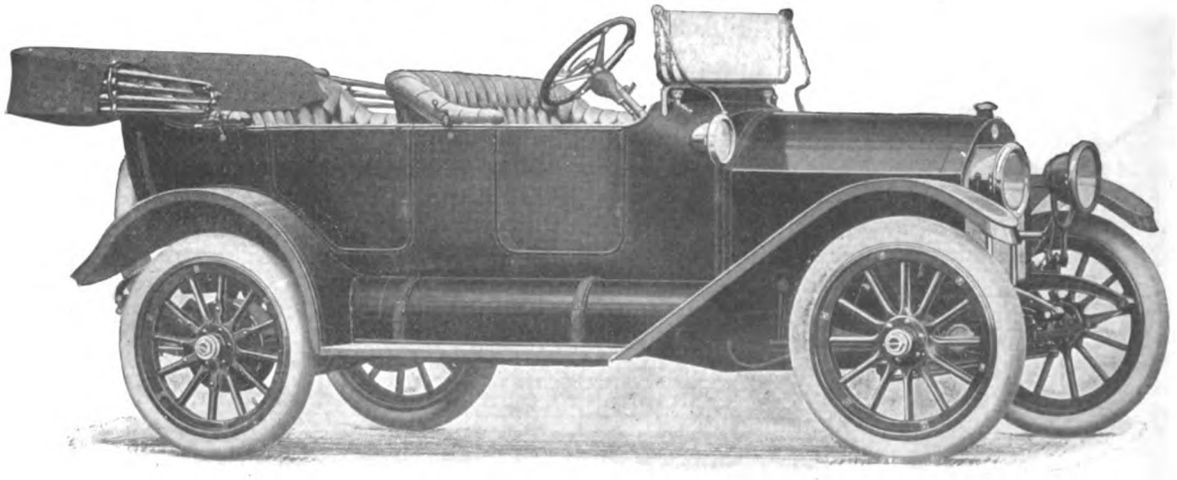
Marion



You Can Buy a Duplicate Of Any Marion Show Car

1913 Marion show cars are typical of the entire Marion product. You can purchase any Marion car on exhibition or get a duplicate of any model from any Marion dealer.

Every show in the 1913 circuit will have stock Marion cars, but in beauty of line and finish and in completeness of equipment, they equal any cars which are especially prepared for the show season.

This accords with the Marion policy of giving to purchasers and dealers the very best workmanship, attention and finish attainable. These cars are made in the largest automobile factory in Indianapolis, they have been built successfully for 10 years, and they are better now than ever.

Do not miss seeing Marion cars at the show—or see ones just like them in our dealers' show rooms. At New York they appear in the Grand Central Palace. In Chicago at 2450 Michigan Avenue.

Marion 37-A, Completely Equipped, $1475

1913 Marion cars are pre-eminent because of their graceful appearance, beautiful finish, class and luxury. They are powerful, sturdy and strong. The completeness of their equipment alone would make them notable.

There are four body models: 37-A, 30-40 h.p. five-passenger touring car, $1,475; 48-A, 48 h.p. five-passenger touring car, the Marion "de luxe," with electric self starter, $1,850; the famous Marion "Bobcat" speedster, 30-40 h.p., $1,425, and the latest Marion 38-A, 30-40 h.p. fore door roadster, $1,475.

These cars are built expressly for those who require reliability, comfort, style and full value for the money. Their position in the 1913 line-up is unique. For ten years they have been manufactured with unusual quality. In equipment they have no superiors. As to their standardization and success, there has never been a question. To produce and market the 1913 series, we have increased our capitalization one million dollars and have recruited experts from the oldest and biggest factories in the industry.

We cannot begin to enumerate all the points you will note and immediately like about the 1913 Marion. See them at the shows, or let us send you illustrated literature. We offer the fairest sales agreement ever written. If you are a dealer do not allow this opportunity to pass.

Big Features, Marion 37-A

Disco Self Starter.	Dynamo Electric Lighting System.	Ample Power.
Prest-O-Lite Tank.	Q. D. Demountable Rims, One Extra.	Long Easy Springs.
Warner Speedometer.	Mohair Top, Boot, Storm Curtains.	Comfort, Dependability.

A Trade Paper Giving the World's Motor News

Vol. XXXIV
No. 4

New York, January 23, 1913

Ten cents a copy
Two dollars a year

The Highest Endorsement Ever Given an Automobile Accessory

What the Automobile Manufacturers Say About the GRAY & DAVIS Electric Starter

"A real starter—not an experiment but absolutely the best that can be had—a starter that has proved itself 100 per cent. efficient in thousands of tests."

PAIGE-DETROIT MOTOR CAR CO.

"The Gray & Davis Electric Starter and Electric Lighting Dynamo are the best to be had regardless of price."

POPE-HARTFORD CO.

"More reliable and efficient than any other Starter."

PILOT CAR SALES CO.

"The Stearns equipment is absolutely complete. It includes Gray & Davis Electric Lighting and Starting system."

THE F. B. STEARNS CO.

"The most noticeable advancement for 1913 season is the adoption of the Gray & Davis electric self-cranking mechanism."

VELIE MOTOR VEHICLE CO.

"The most powerful Starter ever used."

PEERLESS MOTOR CAR CO.

"Admitted by authoritative engineers to be without a superior."

LOZIER MOTOR CO.

"It appeals to the man who is car-wise because it is easily operated and does not complicate ignition."

THE MOTOR CAR MFG. CO.

These statements answer the starter question; they offer the highest possible testimony regarding the efficiency of the GRAY & DAVIS Starter.

GRAY & DAVIS, Inc., 55 Lansdowne St., Boston, Mass.

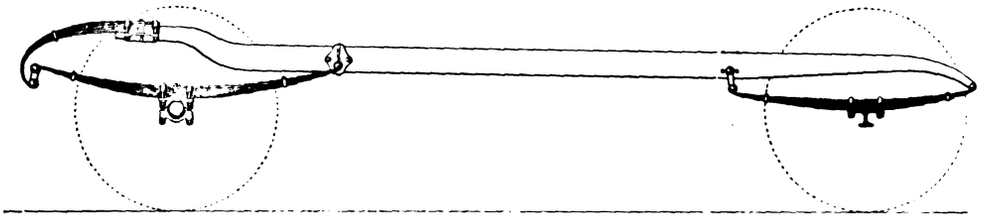
Truffault-Hartford SHOCK ABSORBER

Bigger and Better Sales for You

The owner---the manufacturer---the dealer---all are vitally concerned in the sale of a car.

Car owners---nowadays---are educated in motor-knowledge. They insist that the car they buy shall have certain standard equipment. And they have learned that Truffault-Hartford Shock Absorbers are standard. They demand them on the cars they buy---they want the assurance of greater comfort---greater efficiency---and the lowest possible upkeep cost.

Car manufacturers---27 of the leading makers---have recognized this demand. And they meet it by equipping their cars with Truffault-Hartford Shock Absorbers---at the factory.



YOU---the progressive dealer---owe it to yourself to insist that the car you sell shall be able to meet this demand. And by meeting it you pave the way for bigger and better sales for the car you represent.

The Fastest Train in the U. S. Beaten

In a novel and exciting race between Mr. Koenig, the daring but modest young motorist, driving his car over the frozen surface of the Hudson River at Tarrytown, N. Y., and the "Twentieth Century Limited," WEED CHAINS are victors.

"Although such great speed has never been attained before on ice by an automobile, and seems wonderful to the inexperienced," said Mr. Koenig, "the average motorist knows that high speed can be made on ice and snow, the same as under normal conditions, if chains are used on all four wheels.

The tire chains on the back wheels give traction and prevent the skidding that would be expected to be **dangerous** when driving under such conditions, and the pair **of chains** on the front wheels give steering steadiness.

I find that I can drive my car just as steady **over the smooth**, glossy surface on the ice, as any driver can pilot **his car** over a dirt course, and without the least bit of fear."

Weed ANTI-SKID Chains

Insure Perfect Traction—Absolutely Prevent Skidding

Motor Magazine very graphically says: "The actual operating conditions of a motor car are practically **reversed in winter.** Your problems are entirely different. Instead of worrying about punctures—you must **think about skidding.**"

Tire manufacturers have attempted to solve the skidding problem by the manufacture of almost every conceivable style and design of tread—possibly more or less effective when new; but it is no uncommon sight to see these so-called non-skidding tires fitted with **WEED CHAINS** when there is snow or ice on the ground, or when the roads are muddy and slippery.

WEED CHAINS are universally acknowledged to be the only Anti-Skid device that can be absolutely relied upon at all times and under all road conditions.

Forget your worries about snow and ice—slippery roads and pavements. Fully equip your car with **WEED CHAINS** and **feel secure.**

If you haven't a set of **WEED CHAINS,** or if you have a pair for the rear tires only, get a full equipment now. Delay is dangerous. Stop at your dealer's today and **WEED CHAIN** your car to safety.

For sale by all reputable dealers

¶ High flash and fire tests.

¶ High Baume gravity.

¶ Highly filtered and not acid treated.

¶ Proper "body" or viscosity.

¶ A "straight run" product.

¶ Made only from Pennsylvania crude.

¶ All these points are considered essential to a good automobile cylinder oil and are all found in

MONOGRAM OIL

¶ And what is really important to all dealers is that we protect the trade and refer inquiries and orders to those dealers who handle our product.

High-Priced Feature No. 12

The springs on the Overland Model 69T equal those on $1200 cars. They are of the highest grade, heat treated spring steel.

The front springs are semi-elliptic, 36 inches long and 1¾ inches wide.

The rear springs are three-quarter elliptic, 42 inches long and 1¾ inches wide—with scroll ends.

Model 69T springs each possess six sturdy leaves with steel bushing eyes. The shackles are drop-forgings; they are fitted with case-hardened bolts, working in special auto-friction bushings. The spring seats in the rear axle are left free to oscillate on their saddles, insuring great riding comfort.

Model 69T springs must finally endure a vibration test on a special testing machine with a capacity of 6,000 lbs.

We repeat again: $1200 cars have no better springs than the Overland for $985.

Write us for literature. Please address Dept. 50.

Vol. XXXIV New York, U. S. A., Thursday, January 23, 1913 No. 5

INVADER OILS TAKEN OVER BY TOMLINSON INTERESTS

Kellom Remains President But Tomlinson Will Manage New $250,000 Company—General Offices Removed to New York.

T. E. Tomlinson, one of the first men in this country to delve deeply into the development of special oils for automobile use, last week concluded negotiations with Chas. F. Kellom & Co. of Philadelphia, Pa., makers of Invader oil, whereby the entire business and good-will of that firm were acquired by a new corporation, styled the Invader Oil Co., of which Tomlinson will be vice-president and general manager.

Charles F. Kellom will be retained as president and the Kellom manufacturing and selling organization will remain intact. H. Dunthorn will become secretary and treasurer of the new company, which has been incorporated under the laws of New Jersey with an authorized capital of $250,000. The general office of the Invader Oil Co. will be located at 80 Broad street, New York City, but the factory will remain at 113 Arch street, in Philadelphia.

In addition to the Kellom sales staff, which includes D. A. Scheu, who for many years covered New England, Tomlinson has associated with him a number of the better known men who were identified with him in his previous enterprises, among whom are H. Dunthorn, A. A. Francesconi, Howard Plowman, Harvey Wilkins, E. Kalkhof, F. Menke and A. Rafelson.

Charles F. Kellom started in the oil business in 1881 and claims to have been the first man to introduce the light oil for automobiles which, since has come into general use. He is possessed of a ripe fund of experience and relates with no little amusement the suspicions with which his light oil first was received. In several instances, it required that he give a guarantee to cover any damage to the buyer's car which it was feared it might sustain. Tomlinson first engaged in the oil business several years ago and made his mark with the Havoline oil, which he created. Later he organized the Wolverine Lubricants Co., which he also built up to large proportions.

Berrys Now a $3,000,000 Corporation.

Berry Bros., the well-known Detroit varnish makers, who heretofore have done business as a partnership, have converted their business into a corporation, Berry Bros., Ltd., with an authorized capital of $300,000. The officers of the company are: President, Frank W. Blair; vice-presidents, Thomas Berry and E. W. Pendleton; treasurer, Geo. H. Russel; secretary, Edwin Lodge; assistant secretary, F. L. Colby; assistant treasurer, W. R. Carnegie; general manager, Jas. S. Stevenson. The business was established in 1855 by the late Joseph Berry and gradually attained its present huge proportions.

Sullivan Revives Tire Dating Bill.

Senator "Christy" Sullivan, who represents the Bowery district of New York City in the State legislature, and who is credited with possessing a keen scent, on Monday last, 20th inst., introduced a bill seeking to compel manufacturers of automobile tires to brand or otherwise state the date of manufacture on each tire produced. It was referred to the Committee on Miscellaneous Corporations. The bill is similar to the one which was introduced last year and which required the automobile tire interests to exert considerable opposition before it was killed.

Randolph Truck in Receiver's Hands.

The Central Trust Co. of Chicago has been appointed receiver for the Randolph Motor Truck Co. of Flint, Mich., the control of which rested with Chicago men. About four months ago the factory occupied by the Randolph company was sold over its head, so to speak, and since that time its affairs have been more or less "in the air."

WILLYS ACQUIRES INTEREST IN ENLARGED FISK COMPANY

Toledo Car Maker Becomes Heavy Stockholder in Massachusetts Tire Plant—Dunn and Fisk Remain.

When, in October last, the Fisk Rubber Co., of Chicopee Falls, Mass., then a $4,000,000 corporation, give up its Delaware charter and reincorporated under the much stricter laws of Massachusetts, with an authorized capital of $10,000,000, the fact naturally gave rise to comment and speculation, but its exact meaning was known to comparatively few.

It became more or less common property that men of influence were about to acquire an interest in the Fisk company, but until early this week the name of the chief figure involved, John N. Willys, president of the Willys-Overland Co., had not escaped. Immediately it was let fall, however, the report spread like wildfire that Willys had purchased the Fisk property, or, at any rate, had acquired control of the controlling Mayo interests.

Willys himself left New York before the report gained circulation, but Harry T. Dunn, president of the Fisk Rubber Co., states the time is not ripe to disclose the details of the plans in view. He admits that Willys had become one of the largest stockholders in the company, but states that he himself and H. G. Fisk, secretary-treasurer of the Fisk company and one of the representatives of the Mayo estate, will considerably increase their holdings and will remain in full charge of the company, which will continue to stand alone. Willys, he added, will neither become an officer or director nor be active in its management.

It is probable that the capitalization of the company will be increased, but to what extent Dunn would not say. He did say, however, that the new flotation already had been underwritten.

RUBBER GOODS INVOLVED IN NINE-YEAR-OLD BANKRUPTCY

Trustee of Munger Tire Company Seeks to Force Payment of $33,000 on Preferred Stock—"Angel" Who Backed Out.

Legal procedure often proves more lengthy than the litigant expected, but what bids fair to become a record for a long-drawn-out bankruptcy case is that of the once well-known Munger Vehicle Tire Co., which started on its way through the Federal court in New York City in 1904 and now has, through its trustee in bankruptcy, William A. Evans, filed suit in the Supreme Court for New York county against the Rubber Goods Mfg. Co., a United States Rubber subsidiary, in an effort to collect $33,124.25, its only available asset. Before the action is brought to a close the record of time elapsed is likely to be at least nine years.

The present suit has its beginning at the time Louis de F. Munger obtained patents on a tire and formed the National Wheel & Traction Co., with a factory in New Brunswick, N. J.; in 1899 the principals in this company interested William M. Ivins, a director and member of the executive committee of the Rubber Goods Mfg. Co., and the Munger Vehicle Tire Co. resulted. The National company had expended $16,000 in launching the Munger tire, and when the new Munger company was formed with a capitalization of $600,000 common and $100,000 preferred stock, the National was given $16,000 of the preferred, all the rest going to the Rubber Goods company with the exception of qualifying shares to the directors.

Of the remaining $84,000 preferred, the Rubber Goods was to pay in money as it was required for the operation of the business, and up to August, 1901, had paid in $50,875.75, when it decided it had been "angel" for long enough and quit. Shortly thereafter bankruptcy proceedings were instituted, and the report of the master in bankruptcy showed that there were claims of $19,286, with an added court and legal fee [illegible] $10,000, making a total indebtedness practically amounted to the money it already had paid for preferred stock up to the time of the failure of the company. The adjudication in bankruptcy occurred January 3, 1905, but since that time the Munger company has remained a corporate body for the purpose of clearing up the tag ends of the business. Just why the matter was permitted to drag along until now is not stated, but it is certain that the Munger trustee has determined to win or lose the $33,000.

After the complaint was filed the Rubber Goods demurred, the Munger company amended its complaint and various motions have brought the time for answering the amended complaint down to the present week, when several technical details are to be disposed of. One of these is that the causes of action be stated separately; meantime the case is moving toward trial.

Lozier and Baltimore Dealer Embroiled.

Albert J. Fleischman, former Lozier dealer in Baltimore, Md., through his assignee, Abe Rosenfeld, instituted a suit in the Supreme Court for New York county this week against the Lozier Motor Co., of Detroit, Mich., asking $5,128.32 as damages sustained by reason of acts of the manufacturing company while he represented it. His claims are: $1,100, commission on a car sold by the Lozier company in his territory to one of his prospects; $1,000, deposited at signing of contract and to be deducted from the price of the last of an order of ten cars, he not being able to sell the ten because the company discontinued the models he was selling; $1,028.32, price of parts returned to the factory; $1,000, company's share of loss on used cars taken in trade, according to agreement; $1,000, amount paid for agency and not returned to him.

Chanslor & Lyons Merge Their Interests.

The Chanslor & Lyon Motor Supply Co., one of the most extensive jobbing concerns on the Pacific Coast, has merged its various interests into what hereafter will be known as the Chanslor & Lyon Co. The change is in name only and does not in any way affect the personnel of the company, whose headquarters, as heretofore, will remain in Los Angeles. The established branches will be continued in San Francisco, Fresno, Port-

FINANCIAL EMBARRASSMENT FOLLOWS PATENT VICTORY

Bank Petitions Searchlight Gas Into Receiver's Hands—Patent Decision May End Prest-O-Lite's Relations With Licensor.

Ill fortune closely followed good fortune into the Searchlight Gas Co. After emerging successfully from the litigation which resulted in a "death sentence" for the Prest-O-Lite patents, the Searchlight company last week was thrown into the hands of a receiver on the petition of the Continental and Commercial National Bank, of Chicago, whose claims on notes aggregate $50,000

The petition was filed in the Federal court in Cleveland, the Searchlight's main plant being in Warren, O., although its headquarters are in Chicago, and also are included in the receivership. Horace B. Pearson, of Chicago, general manager of the company, was named as receiver, with authority to continue the business. His bond was placed at $10,000. The company, which had outgrown its resources, assented to the receivership.

According to the complaint in the case, the Searchlight liabilities amount to $200,000 and its assets to $400,000, which, because of their nature, are not easily convertible into cash.

The Searchlight Gas Co. of Delaware, a holding company, with authorized capital of $500,000, is not affected by the proceedings.

The Searchlight company set out to become an active competitor of the Prest-O-Lite interests, but on several occasions, it is stated, the Searchlight property was offered to its big rival, which, however, preferred litigation to purchase.

Incidentally, the overturning of the Claude and Hess patent in the Prest-O-Lite-Searchlight suit may cause an automatic dissolution of relations between the Prest-O-Lite Co. and the Commercial Acetylene Co., since the latter owned the patent and the former had obtained rights of manufacture. The Acetylene company, itself, has factories in Harrison, N. J., Atlanta, Ga., and one in Canada and is en-[illegible]ish

UNCLE SAM EXTINGUISHES FOUR NEVEROUT PATENTS

Federal Court Declares Invalid All of Much Exploited Bracket Rights—Uses Vigorous Language in Sweeping Decision.

In the opinion of Judge Cross, of the United States District Court for the District of New Jersey, if the Neverout lamp bracket discloses invention, "it is of a low order," so low that he has declared the patent on it invalid.

It is one of the four patents which the Rose Mfg. Co., of Philadelphia, has brought to bear against a number of manufacturers and jobbers, and while he was in the mood Judge Cross made a thorough job of it. He bowled out and declared invalid not only the lamp bracket patent, No. 883,973, and the license bracket patent, No. 962,220, but the two design patents covering license plate supports, Nos. 41,388 and 41,389.

He rendered the sweeping decision in the suit brought by the Rose Mfg. Co. against the E. A. Whitehouse Mfg. Co. and the La Compte Mfg. Co. of Trenton, N. J., which had been pending for nearly two years.

When the suit was filed, the defendants, who were sued jointly, entered a demurrer which not only attacked the validity of the patents but claimed that such jointure constituted multifariousness. The demurrer, however, was over-ruled by Judge Rellstab, who admitted that the Rose patents left his mind in "a state of dubiety" and he, therefore, ordered the case to trial.

Judge Cross, who just has decided it, employs vigorous language in declaring all of the patents involved without merit, and, so far as concerns the Neverout lamp bracket, declared that the idea embodied is of the "simplest character and of questionable patentability," and when considered in relation to the prior art, "it becomes manifest that the attempt further to dilute this simple idea and then protect it by means of a patent should not be fostered." He holds that E. M. Rosenbluth, the patentee, "merely took what was old and commonplace and applied it to a new use," his lamp bracket being akin to similar devices which have been employed for household lamps and for signboards and other things. In declaring invalid also the license tag bracket, covered by patent No. 962,220, granted to W. D. Hughes, the court stated that Rosenbluth's patent of itself was sufficient to defeat it.

The two design patents involved were held to be neither new, original nor ornamental. Judge Cross said that such a patent "must exhibit something which appeals to the esthetic faculty of the observer," and added that a valid design patent does not necessarily result from the mere filing a certified photograph of a manufactured article. Every feature of the Neverout design, he stated, "is mechanical and functional and not ornamental," adding that "even ordinary rivet heads are made to appear as beautiful circles in this scheme of ornamentation."

Klaxon Joins Issue With Sparton.

The Lovell-McConnell Mfg. Co. of Newark, N. J., has accorded a quick and warm "welcome" to the very newest motor driven horn, the Sparton, made by the Sparks-Withington Co. of Jackson, Mich., which they claim externally and internally closely resembles the Klaxet. The "welcome" took the form of the institution of suits for infringement against three New York dealers whose cars were equipped with the Sparton signal—i. e., the Jackson Eastern Distributors, the Haynes Automobile Co. and the Garland Automobile Co., the latter of which handles the Velie car.

The actions were instituted in the United States District Court for the Southern District of New York and allege infringement of the Klaxon patents No. 923,048, 923,049 and 923,122. The Lovell-McConnell people explain that they did not proceed directly against the Sparks-Withington Co. because of their inability to purchase any of the Sparton horns which were exhibited by their makers at the New York show.

"35%" Sues Maker of Aplco System.

The 35% Automobile Supply Co., of New York City, filed a suit Friday last, 17th inst., in the Supreme Court for New York county against Vincent J. Apple, trading as the Apple Electric Co., of Dayton, O., demanding judgment for $2,832.15 on an advertising contract; it alleges that Apple agreed to supply the "35%" with Aplco lighting systems to the value of $3,600 in the course of a year, in exchange for which the system was to be advertised in the more or less notorious monthly circular issued by the "35%," which caused several similar suits. It is alleged that Apple furnished goods to the amount of $767.85 and then broke the contract.

Sue Over Velvet Shock Absorber Deal.

John W. Blackledge, who is the principal part of the John W. Blackledge Mfg. Co., of Chicago, manufacturer of Velvet shock absorbers, has instituted suit in the Supreme Court for New York county against Geo. Sumner, Inc., who a short time ago undertook to act as metropolitan agent for the Blackledge product; failure to fulfil the terms of the contract is the basis for the suit; damages of about $1,000 are sought.

RECEIVERSHIP TO UNRAVEL FIRESTONE-COLUMBUS KNOTS

Old Buggy Company Embarrassed by Its Gasolene Cars—Friendly Creditor Averts Drastic Action to Assist Reorganization.

In order to forestall threatening and more drastic action on the part of less friendly creditors, Valentine & Co., the New York varnish makers, on Saturday last, 18th inst., applied for and secured the appointment of a receiver for the Columbus Buggy Co., of Columbus, O. The court named Daniel McLarin, of Cincinnati, to fill that office and fixed his bond at $100,000. He is a brother-in-law of Charles E. Firestone, secretary of the Columbus Buggy Co., and took charge immediately. The other officers of the company are C. D. Firestone, president, and O. H. Perry, treasurer.

The assets of the Columbus Buggy Co., which is capitalized at $2,000,000, are estimated to be $1,000,000; its liabilities slightly exceed $600,000.

In addition to horse-drawn vehicles, which it has manufactured for more than a quarter of a century, the company has been manufacturing the Firestone-Columbus gasolene car and the Columbus electric. It is stated that, while the production of horse vehicles and electrics has been profitable, the earnings have been more than eaten up by the manufacture of gas cars, which it is intimated may be discontinued when the reorganization, which it is expected will follow the receivership, is brought about. It also is stated that the reorganization will be thorough and may result in a general change of management.

According to the petition of Valentine & Co., whose claim amounted to $3,436.61, the Columbus company is doing a large business and has on its books orders to the value of $1,250,000, but its credit is so seriously impaired that a receivership was necessary to save the situation from more drastic action on the part of creditors who not only refused to extend further credit, but threatened to institute suits to enforce their claims. In all there are more than 280 creditors.

With a receivership in force, and with the business continuing without interruption, it is believed that all of the stock on hand will be converted into sufficient money to pay all obligations.

The company was organized in the late 70's and grew into one of the largest producers of buggies in the world, several other manufacturers have been merged with it, among them the Peters Dash Co. About a generation ago it became financially in-

Digitized by Google

volved and passed into the hands of a receiver, from which, however, it emerged successfully. At that time the Peters interests were deeded to C. D. Firestone, then one of the principal owners, and at present the principal owner of the concern, for the purpose of effecting a compromise with the creditors. Recently the common pleas courts, upon the application of the Peters heirs, declared that this deed was one in trust and not in fee simple. The effect of this decision, if sustained in the higher courts, will be, it is said, to compel an accounting to the Peters heirs for profits which have been earned since the compromise was effected.

Flames Wipe Out Buick Foundry.

An explosion in the aluminum foundry of the Buick Motor Co. in Flint, Mich., on Friday last, 17th inst., completely destroyed that structure and the machinery which it contained. The loss is estimated at $40,000. The foundry was the only frame building in the entire plant and proved an easy prey to the fire which followed the explosion.

Mohawk Acquires Stein Double Cushion.

The Mohawk Rubber Co. of Akron, O., which recently was incorporated with an authorized capital of $350,000, has taken over the plant of the Stein Double Cushion Tire & Rubber Co. in that city. It is stated that it will considerably enlarge the property.

ENGLAND TAKES FEWER CARS BUT EXPORTS KEEP GAINING

Shipments During November 32 Per Cent. Better Than in Same Preceding Month—Britain's Decrease 59 Per Cent.

The fact that shipments of American cars to Great Britain have decreased $524 559 during the last four months seems to have little effect upon the exports as a whole, for while the purchases of the United Kingdom for November last were 59 per cent. less than in the corresponding month of the previous year the total exportations to the twelve geographic divisions into which Federal statisticians separate foreign lands was 24 per cent. greater in number and 32 per cent. in valuation than in November of 1911. The shipments in November, 1911, were 1,364 cars, valued at $1,382,804, and in November, 1912, 1,689 cars, valued at $1,807,066, gains of 325 in number and $510,279 in valuation. The United Kingdom's comparative imports for Novembers of 1911 and 1912, respectively, were 397 cars at $334,151 and 164 cars at $139,222.

Of the twelve divisions all but three registered gains, and of these the heaviest gainer in numbers and value was Canada, with 215 more cars and an increase of $183,588 in valuation. In per centage of gain in valuation the ranking of the divisions was: Italy 566, Other Europe 423, France 395, Germany 389, Other Countries 130, Asia and Other Oceania 114, South America 112, Canada 50, and West Indies and Bermuda 48. The losses were United Kingdom, $194,929, or 58 per cent.; Mexico, $29,815, or 37 per cent., and British Oceania, $3,513, or 1 per cent.

The average value of cars shipped from the United States in the two Novembers was: All foreign countries, 1911, $1,014; 1912, $1,069; United Kingdom, 1911, $842; 1912, $848; American possessions, 1911, $1,566; 1912, $1,804. In the first 11 months of 1911 the average value of the cars shipped to foreign countries was $1,248, and in that period of 1912, $997, a decrease of $251, or 20 per cent. Parts exports aso gained by $86,017, or 41 per cent.

Of the non-contiguous American possessions Hawaii recorded the greatest gain in number, augmenting its purchases by 13 cars, or 30 per cent., but the Philippines assumed leadership in monetary gain, taking cars of an increased valuation of $20,034, or 109 per cent. Porto Rico fell behind by 45 cars, or 66 per cent., and $63,019, or 70 per cent., thus causing the possessions as a whole to lose by 30 cars and $21,785, respective percentages of 22 and 10. Since Alaska in November, 1911, took no cars and in that month of 1912 bought one, valued at $500, its gain per cent. is not expressible in figures. The statistics in detail follow:

	November				Eleven Months Ending November					
	1911		1912		1910		1911		1912	
	Quantities.	Values.	Quantities.	Values.	Quantities.	Values.	Quantities.	Values.	Quantities.	Values.

The Week's Incorporations

Toronto, Ont.—McKinnon Motor Vehicles, Ltd., under Ontario laws; authorized capital, $100,000; to manufacture and deal in motor cars.

Muskogee, Okla.—Kittto Garage, under Oklahoma laws; authorized capital, $1,000; to operate a garage. Corporators—A. L. Kitto, Harry Kitto, S. V. Kitto.

Springfield, Ill.—Reliance Supply Co., under Illinois laws; authorized capital, $2,500; to deal in motor car supplies. Corporators—C. M. Sutton and others.

Louisville, Ky.—Speedway Tire Co., under Kentucky laws; authorized capital, $250,000; to manufacture motor car tires. Corporators—H. L. Lewman and others.

Akron, Ohio—Mohawk Rubber Co., under Ohio laws; authorized capital, $350,000; to manufacture rubber goods. Corporators—R. M. Pillmore, J. K. Williams, S. S. Miller.

Columbus, Ohio—Park Motors Co., under Ohio laws; authorized capital, $30,000; to deal in motor cars. Corporators—Scott Van Etten, Charles Parkison, Amelia Van Etten.

Indianapolis, Ind.—Ray Harroun Co., under Indiana laws; authorized capital, $50,000; to deal in motor cars. Corporators—Ray W. Harroun, L. R. Townsley, U. G. Baker.

Cleveland, Ohio—Alco Motor Supply Co., under Ohio laws; authorized capital, $10,000; to deal in motor car supplies. Corporators—M. Kluger, C. K. Halle, Frank Butler.

Akron, Ohio—S. & M. Tire & Rubber Co., under Ohio laws; authorized capital, $20,000; to deal in motor car tires. Corporators—Alois Michler, Erwin S. Kintz, Charles M. Smith.

Jersey City, N. J.—National Welding Co., under New Jersey laws; authorized capital, $25,000; to manufacture motor car parts. Corporators—E. P. Hoyt, S. H. Culver, J. W. Phillips.

Quincy, Ill.—Machinery & Motor Co., under Illinois laws; authorized capital, $25,000; to operate an automobile repair shop. Corporators—F. H. Wilms, B. Kinsey, H. V. C. Tingley.

Jamestown, N. Y.—Peterman Garage Co., under New York laws; authorized capital, $5,000; to operate a garage. Corporators—Otto G. Peterman, August Peterman, Myrtle S. Peterman.

Albany, N. Y.—Kupke Auto Renting Co., Inc., under New York laws; authorized capital, $1,000; to operate a motor service. Corporators—Eugenie C. Kupke, Robert E. Male, Willard McCune.

Cincinnati, Ohio—Automobile Clearing House Co., under Ohio laws; authorized capital, $2,500; to deal in motor cars. Corporators—Thomas A. Reilly, Edwin P. Bernardi, Samuel D. Bromley.

Cincinntai, Ohio—Model Garage Co., under Ohio laws; authorized capital, $10,000; to operate a garage. Corporators—Edward Hine, Martin Fette, Carl Reichelman, Clara Heine, Della Cottrell.

Detroit, Mich.—Detroit Flash Curtain Co., under Michigan laws; authorized capital, $25,000; to manufacture motor car curtains. Corporators—Fred J. Schaffer, Wm H. Goodfellow, Harry M. Vaughn.

Indiana Harbor, Ind.—Harbor Garage & Machine Co., under Indiana laws; authorized capital, $7,500; to operate a garage and repair shop. Corporators—Gustave Jernberg, August Jernberg, Charles Saluski.

Buffalo, N. Y.—F. A. M. Auto Supply Co., under New York laws; authorized capital, $20,000; to deal in motor car supplies. Corporators—Frank A. Marburg, John B. Green, Richard H. Templeton, all of Buffalo.

Brooklyn, N. Y.—Hoyt Garage, Inc., under New York laws; authorized capital, $1,000; to operate a garage. Corporators—Louis C. Brooks, 354 Baltic street; Walter J. Kelly, 2063 East 14th street; Charles Blaken, 290 2nd street.

Utica, N. Y.—F. P. Miller Motors Corp., under New York laws; authorized capital, $5,000; to deal in motor cars. Corporators—Henry R. Beebe, 15 Avery Place; William T. Cantwell; 306 Bleeker street; Francis P. Miller, 333 Bleeker street.

New York, N. Y.—Co-Operative Used Car Co., under New York laws; authorized capital, $3,000; to deal in motor cars. Corporators—Joseph B. Bauer, 2031 Seventh avenue; Louis Ezechiel, 430 Columbus avenue; John Curtis, 600 West 139th street.

New York, N. Y.—Auto Buyers' Co, of America, Inc., under New York laws; authorized capital, $1,000; to deal in motor cars. Corporators—Julius Lichtenstein, 790 Riverside Drive; John P. McClellan, 646 Lenox avenue; Arthur A. Hill, Larchmont.

New York, N. Y.—Gas Saver Sales Co., under New York laws; authorized capital, $25,000; to manufacture motor car devices. Corporators—H. Clarence Fisher, Broadway & 86th street; John H. Miller, 61 West 108th street; Eugene Cable, 56 West 23rd street.

Brooklyn, N. Y.—Pratt-Hendricks Co., under New York laws; authorized capital, $1,000; to deal in motor cars. Corporators—William H. Pratt, 343 Willoughby avenue; William J. Hendricks, Jr., 223 Eastern Parkway; George L. Robinson, 76 William street.

New York, N. Y.—Miller Tire Sales Co., under New York laws; authorized capital, $5,000; to deal in motor car tires. Corporators—Harry C Miller, 608 Warburton avenue, Yonkers; Harrison C. Mills, 193 Woodworth avenue, Yonkers; Warren A. Schenck, 473 West 158th street, New York City.

Recent Losses by Fire.

Mason City, Ia.—Russell's Garage, stock destroyed. Loss not given.

Pen Arglye, Pa.—Arbogast & Bastian Co., garage damaged. Loss, $25,000.

Flint, Mich.—Buick Motor Co., aluminum foundry destroyed. Loss, $40,000.

Omaha, Neb.—Prest-O-Lite Co., 11th and Seward streets, plant damaged. Loss, $6,000.

New York, N. Y.—Auto Holding Co., 502-8 West 47th street, building damaged. Loss, $3,000.

Exeter, Cal.—Benjamin Smith, garage and machine shop damaged. Loss not given.

Lincoln, Neb.—P. C. Smalley, 12th and P streets, garage and 15 cars damaged. Loss not given.

Woonsocket, R. I.—Joseph N. Bonier, automobile and wagon paint shop damaged. Loss, $1,000.

Toledo, O.—Willys-Overland Co., one-story, frame shipping room, six freight cars and 18 automobiles damaged.

Van Wert, O.—Charles M. Smith, garage and 12 cars damaged by fire following gasolene explosion. Loss not given.

Cincinnati, O.—Fisher Automobile Co. and Cruse Auto Co., 808 Race street, building and contents damaged. Loss, $12,000.

METROPOLITAN DEALERS IN ANTI-THEFT ASSOCIATION

Seek to Prevent Fraudulent Securing of Cars and Accessories—Two Arrests—Loss $75,000 in Four Months' Time.

Although it was organized four months ago, the Automobile and Accessories Dealers' Protective Association of New York City has kept its existence a secret until now, that it might better accomplish the task for which it was formed, its object being to break up a system of obtaining goods under pretenses so questionable as almost to constitute outright theft; the dealers report they have suffered a combined loss of $75,000 within the last six or eight months, of which $25,000 represents the valuation of cars. More than $200,000 is said to have been mulcted from tradesmen and individual owners together.

As the result of the association's efforts there have been arrested Louis Kaplan, known as the proprietor of the East Side Trucking Co., of 336 East 27th street, and Abraham Vogel, whose real name is said to be Bogus, who represented himself as the owner of the Willoughby Street Garage in Brooklyn. The alleged swindlers are said to have followed the scheme of approaching a car dealer to whom they would show a garage filled with cars, many of them the property of confederates; the prospective buyer would then offer to purchase a car, saying that only a part cash payment could be made. The balance, the buyer would say, could not be paid until a week or two later and would be represented by notes. The sight of the busy looking garage generally served to allay suspicion. Then, after the car was delivered it would be sold for about half its value and the dealer's only remedy appeared to be a civil suit on the notes.

Tire dealers, for instance, were shown the car-filled garages and readily furnished supplies, as did accessory men. All the goods were sold at reduced prices. Each transaction, of itself, was so technically legal that it was necessary for the association to prove fraudulent intent by linking a han, Empire Tire Co., and Claude Pinney, Advance Rubber Co. Moos, Prince & Nathan are the association's counsel and are directing the legal end of the work. Detective Sergeant Talt has been detailed by Deputy Commissioner of Police Dougherty to assist.

Some of the losses sustained are: Kissel company, $5,000; Goodyear Tire & Rubber Co., $1,000; Century Tire Co., $800; Stein Laplock Tire Co., $700; Empire Tire Co., $600; Central Tire & Supply Co., $500; Akron Tire Co., $400; Brooklyn Tire & Auto Supply Co., $800; Abbott-Detroit Motor Co., $900. Indictments by the grand jury are expected, as are additional arrests.

New York Offices for "U.S.-Maxwell."

For their New York offices, the reorganizers of the United States Motor Co., which is to be renamed the Maxwell Motor Co., have leased extensive quarters in the United States Rubber Building at 57th street and Broadway. The main office, as already is known, will be located in Detroit. The building on West 62nd street, New York, previously occupied by the United States Motor Co., and in which it holds an equity of $100,000, shortly will be offered for sale. It has been appraised at about $600,000.

Oil Company Gets Judgment but no Money.

When the Borne-Scrymser Co., of New York City, sought to collect a bill for about $100 from the Progress Auto Storage & Supply Co., of 209 West 96th street, the same city, it received the information that the business had been turned over to the Progress Garage and the latter declined to pay any of the old company's bills. The oil company thereupon sued, and this week filed judgment in the New York county clerk's office for $106.31 against the Progress Auto & Storage Co.

More Money for Gurney Ball Bearings.

The Gurney Ball Bearing Co. of Jamestown, N. Y., has increased its capital stock from $120,000 to $200,000. Although comparatively little known to the trade at large, the Gurney company, of which S. Winsor Baker is general manager, has developed special machinery which has permitted the production of ball bearings of an impres-

FOSTER M. A. M. PRESIDENT; NEW MEN IN DIRECTORATE

Ohioan Elected to Lead Accessory Manufacturers' Association—Three Veterans Retire—Strong Box Now Contains $100,000.

J. H. Foster, of the Hydraulic Pressed Steel Co. of Cleveland, O., was elevated to the presidency of the Motor & Accessory Manufacturers, Inc., at the annual meeting of the directors in New York on Thursday last, 16th inst. Foster, who previously was first vice-president of the organization, succeeded Harry T. Dunn, who retired after two years of useful service.

To fill the first vice-presidency, the directors chose one of the newest members of their circle, F. Hallett Lovell, Jr., of the Lovell-McConnell Mfg. C. of Newark, N. J. The other officers elected are: C. E. Whitney, of the Whitney Mfg. Co., Hartford, Conn., second vice-president; F. C. Billings, Billings & Spencer Co., Hartford, third vice-president; L. M. Wainwirght, Diamond Chain & Mfg. Co., Indianapolis, treasurer; Alfred P. Sloan, Hyatt Roller Bearing Co., Detroit, secretary and assistant treasurer.

Previously, Whitney was third vice-president and Wainwright secretary and assistant treasurer. The third vice-presidency had been filled by Claire L. Barnes and the treasurership by H. W. Chapin of the Brown-Lipe Gear Co.

At the general meeting of the M. A. M. the day before, when the reports of the retiring officers also were presented, three directors for the three-year term were chosen, as follows: C. E. Thompson, of the Electric Welding Products Co; Alfred P. Sloan, F. Hallett Lovell, Jr., and C. E. Whitney. They succeed D. J. Post, of the Veeder Mfg. Co.; H. H. Chapin, Brown-Lipe Gear Co.; C. T. Byrne, of Byrne, Kingston & Co., and C. E. Whitney, of the Whitney Mfg. Co. The directors who hold over are Messrs. Foster, Duns, Billings and Wainwright, and E. Raymond, E. S. Fretz, W. H. Crosby and T. J. Wetzel.

During the year the membership increased from 151 to 263, and its surplus from $80,000 to $100,000 in round figures.

In the RETAIL WORLD

S. H. Arnold is about to build a garage in San Diego, Cal., at 645 30th street; the cost will be $5,000.

The Dillon-Goodwin Co. has opened up in San Francisco, at 345 Van Ness avenue; Moon cars will be handled.

Walter Hillier has opened a garage in Davenport, Ia., at Broadway and 6th street; he will feature repairing and vulcanizing.

Seymour Barr, of the Scott County (Ia.) Mercantile Co., has become a dealer; he has the Paige-Detroit agency for Scott county in Iowa and Rock Island and Mercer counties in Illinois. Headquarters are in Davenport, Ia.

Dwight I. Holmes and Arthur A. Lee have opened salesrooms in Los Angeles at 1231 South Flower street, where they will market Lancia cars and Speedwell trucks. Lee formerly was connected with the Mercer and Simplex agency.

The Holsman Sales Co., which recently was organized in Des Moines, Ia., has taken temporary quarters at 919 Locust street; the company has the Iowa agency for King cars; the president of the company is J. A. Holsman, formerly connected with the United Motor Des Moines Co.

Charles S. Marshall, for several years connected with the Minneapolis, Minn., branch of the United States Tire Co., has branched out for himself; he has established the Marshall-Racine Rubber Co., at 911 First avenue, south, and will handle the Northwestern distribution of Kelly-Racine tires.

H. C. McVey, former distributer of Little and Chevrolet cars in Indianapolis, having been assigned duties at the Chevrolet factory in Detroit, has been succeeded by the Salyers-Small Co. The latter comprises A. W. Salyers, former Buick commercial car representative in Indianapolis, and William Small, former Buick dealer in Marion, in the same State.

The Baltimore branch of the Franklin Automobile Co., of Syracuse, N. Y., has been taken over by W. F. Kneip, who will conduct it on a dealership basis; for six months Kneip has been associated with E. F. Williams in the Franklin Motor Car Co., of Kansas City, Mo. Prior to entering the retail trade Kneip was commercial car engineer at the factory.

A. R. Warner, J. Gross Beaver and I. D. Hawbecker have formed a co-partnership in Waynesboro, Pa., and will operate on South Patomac avenue under the style Patomac Garage; the firm expects to open up April 1. Warner is a contractor, while the other two are connected with the electrical department of the Landis Tool Co. Beaver will be general manager of the new business.

To handle the agency business of the Spokane (Wash.) Taxicab Co., the Spokane Taxicab Sales Co. has been incorporated with a capitaliation of $10,000; the officers are: President, Walter J. Nichols; vice-president, F. H. McCollough; secretary-treasurer, Lester P. Edge; general manager, G. E. Riegel. These and B. C. Riblet were the incorporators. Detroiter cars are handled.

E. Ross Davis, manager of the Davis Auto Co., of Little Rock, Ark., is forming an owners' corporation to be known as the United Motor Car Co. It will sell and repair cars; owners only will be stockholders, and it is designed that in this way the bills of those who possess cars will be lowered. Six per cent. interest with a division of two-thirds of the net profits anually is planned.

The Motor Vehicle Sales Co., a recent entry into the trade in Kalamazoo, Mich., is about to open salesrooms at 135-7 Farmers avenue. The concern comprises C. C. Dougherty, of Three Rivers, president; H. A. Worthington, of Kalamazoo, secretary and treasurer, and B. O. McElroy, also of Kalamazoo, sales manager. The company has purchased the Buick agency of David Reid and has as territory Kalamazoo and three other Southwestern Michigan counties.

Gus H. Grieger, formerly a member of the Indiana General Assembly from Laporte and Porter counties, is about to enter the automobile trade, his term as a legislator having expired. He has associated with E. H. Steinhart of the Cadillac Auto Co. of Indiana, located in Indianapolis, and the Cadillac Auto Co. of South Bend, a subsidiary concern. The new company's capitalization is $10,000. Grieger formerly resided in Hanna but will remove to South Bend.

The retail sales and service business of the Western Motor Car Co., of 10th and Hope streets, Los Angeles, has been turned over to a new concern, the Chalmers-Los Angeles Co. The latter occupies the premises on Olive street which were occupied by the Western company until recently; the Western company will handle wholesale trade exclusively. A. C. Lusby, for several years with the Western company, will manage the retail business; J. D. Fenton has charge of the service.

W. L. Tedford, principal owner of the Tedford Auto Co., of Little Rock, Ark., has given up all but the new car sales part of the business; he handles the Overland. The repair division of the company has been sold to F. L. Butler, the former foreman, who has styled it the Butler Repair Co. Accessories were taken over by J. B. Pearson, treasurer of the Tedford company, and will be styled Motor Car Supply Co. All three companies will remain at the present location on 9th street and Tedford will store his cars in the garage.

The entry of the Flanders Motor Co. into the reorganized United States Motor Co. will result in the amalgamation of the Landman-Griffith Motor Co., distributers of Flanders products in and about Toledo, O., and the W. H. McIntyre Co., which handles the United States company's cars in the same territory; members of the new company will be Charles P. Landman, W. E. Griffith and W. H. McIntyre, and the new incorporation will be styled the Landman-Griffith-McIntyre Co. The new concern will locate at Madison avenue and 14th street.

The Pan-American Motors Co., of San Francisco, has taken over the newly formed Inter-State Motors Co. and will remove to the latter's place of business on Golden Gate avenue, near Jones street; the line now consists of Dayton and Piggins trucks and Inter-State and Great Western cars, the three latter having been handled by the Inter-State Motors Co., and furnishing a reason for the combine, since the Pan-American wished to add pleasure cars to its line. In the Pan-American there is little change; C. T. Hyland remains president, Captain F. W. Cole vice-president and general manager, and W. A. Baxter, sales manager. A. McLaughlin, of the Inter-State, has joined the sales department of the new business.

WALPOLE TIRE PREFERRED STOCK OFFERED TO PUBLIC

Revenue To Be Used to Increase Volume of Tire Business—Business Triples in Five Years—Statement of Condition.

With additions to its plant in Walpole, Mass., under way which will permit of an output of 1,900 tires per day, the Walpole Tire & Rubber Co., which recently transferred its charter from Maine to Massachusetts, is offering for public subscription its new issue of 7 per cent. cumulative preferred stock; its authorized capital is $4,500,000, of which $3,000,000 is represented by preferred shares and $1,500,000 by common. All save $1,000,000 of the preferred is outstanding.

The present sale of preferred stock is designed to provide for the needs of the tire department, which was instituted about a year ago. Previous thereto the company had been producing a variety of other rubber goods. It claims to be the largest producer in the world of rubber heels and insulating tape.

According to its prospectus, a conservative valuation of the company's property in Walpole, Mass., and Granby, Quebec, exceeds $1,000,000. Its business has increased annually, having grown from $496,901 in 1907 to $1,508,911 in 1911, the greatest increase, however, appearing last year, when with the months of November and December estimated, its gross business amounted to $2,518,725. In that year its net profits aggregated $325,000, on which were paid preferred dividends amounting to $157,229, leaving a surplus of $167,771. With the last two months estimated, the condition of the Walpole company at the end of the year was as follows:

Resources.

Real estate and buildings.....	$545,466.66
Machinery	587,945.57
Water power and equipment...	53,482.35
Merchandise inventory	959,431.10
Accounts receivable	566,957.10
Notes receivable	22,922.18
Cash	122,815.22
Stock owned	755,620.25
Laboratory equipment and patents	750,000.00

There is no bonded or mortgage indebtedness on the Walpole property, nor can any such mortgage be placed without the consent of 75 per cent. of preferred shareholders.

Dividends on the preferred stock have been paid quarterly and for nearly three years dividends, at the rate of 4 per cent., regularly have been distributed to the common stockholders.

The new issue of preferred stock which is being offered to the public is of $100 par value and is redeemable at 120.

Minor Business Troubles.

The Hawley Motor Co., of Quakertown, Pa., has been adjudicated a bankrupt; Oscar O. Bean was named referee by the Federal court in Philadelphia.

The filing of schedules in bankruptcy by the Bates-Odenbrett Automobile Co., of Milwaukee, Wis., against which a petition was filed three weeks ago, discloses the fact that cash in hand amounts to but ten cents; other items are: Taxes due, $532.90; bills payable, $849.63, and debts due, $3,846.

Creditors have filed a petition in bankruptcy against J. J. Behan and S. Frank Behan, who have traded at 702 North King's Highway, St. Louis, Mo., under the style Behan Automobile Equipment Co. They are unincorporated. The six petitioners and their claims, totaling $533.17, are: Diamond Rubber Co., $193.06; J. H. Sager Co., $144; Stewart & Clark Mfg. Co., $24.12; United Rim Co., $25.74; Goodyear Tire & Rubber Co., $46.25, and B. F. Goodrich Co., $100.

Claims Treasurer Was Loaned Money.

How much Clifford M. Bouggy borrowed of the Speedwell Motor Truck & Service Co., of 205-13 West 36th street, New York City, between January 11 and August 25, 1912, while he was acting as treasurer of the company, is a matter in dispute in an action which was filed last week against him in the Supreme Court for New York county by the Speedwell company. It claims he borrowed $1,122.50 and paid back but $256.21, leaving a balance of $866.29, which amount is asked. He admits paying back $256.21 and denies he owes any more, and his only other admission of consequence is that he refused to pay the additional sum which is demanded.

PROMINENT MEN IN TRADE WHO ASSUME NEW DUTIES

Resignations and Promotions That Serve To Place Many Workers In New Places—Few Leave the Industry.

Charles Drum has been appointed production manager for the Keeton Motor Co. of Detroit, Mich. Previously he was connected with the Packard Motor Car Co.

Max Wollering has returned to the Studebaker Corporation in the capacity of production manager of the Detroit plant. He left the company about two years ago to become superintendent of the Flanders Mfg. Co. in Pontiac, Mich.

W. W. Austin, who for several years served as factory manager of the Garford Co. in Elyria, O., has resigned that position, after an association of 15 years with the various Garford interests. His plans for the future have not yet been made.

Charles A. Trask has resigned as factory manager of the Henderson Motor Car Co. of Indianapolis to join the Nordyke & Marmon staff. The vacancy caused by his resignation has been filled by the appointment of J. M. Smith, former factory manager of the Cole Motor Car Co.

John A. Nichols, Jr., has been appointed northeastern manager for the Franklin Automobile Co. of Syracuse, N. Y. During the past year, Nichols has been a Franklin dealer in North Yakima, Wash., but previously was connected with the Franklin company itself, first in its advertising department and later as superintendent of branches. Seattle will be his headquarters.

C. W. Stratford has been appointed chief engineer of the International Motor Co. of New York, maker of Saurer, Mack and Hewitt trucks. He succeeds E. R. Hewitt, who resigned about two months since.

R. K. Davis has been appointed sales manager of the Penn Spring Co. of Baldwinsville, N. Y. He, however, will make his headquarters in the Majestic Building in Detroit. Previously Davis was manager of the United Motor Detroit Co.

J. L. Wellington, one of the former vice-presidents of the United States Motor Co.

Entered as second-class matter at the New York Post Office, November, 1900

NEW YORK, JANUARY 23, 1913

STANDARD OIL AND OTHER PUBLICITY.

It is regrettable that none of the several trade associations which convened in New York last week took any action in respect to what has come to be known as the gasolene situation. It is a subject which strikes at their very vitals, and action by any or all of these organizations would strike a popular chord and convey to dealers and owners that the associations have an eye for more than the interests of the manufacturers alone.

However that may be, goading from many other directions has caused the Standard Oil Co.'s press bureau to undertake a defense of its action in advancing the price of gasolene 90 per cent. in the course of little more than a twelvemonth. The defense was given great prominence in the reading columns of practically all of the leading daily newspapers, but, despite the profound language and masses of figures which are brought to bear, the defense simply resolves itself into the "supply and demand" excuse which is repeated parrotlike in Standard Oil circles whenever inquiry is made or the subject is broached.

No attempt is made to explain the discrimination which prevailed in different parts of the country, which amounted in some instances to as much as four cents per gallon; and, as a matter of course, the Standard Oil employe who is made to appear its spokesman dares not comment on the great, glaring fact that, despite the much-mooted decrease of supply, Standard Oil profits on an abnormal capitalization continue to grow at an equally abnormal ratio. That one fact will stand against any defense which Standard Oil ever may undertake and will give the lie to any excuse with which it may seek to fool the public. It makes clear that Standard Oil, like nearly all other huge corporations, is not inclined to play fair with the public and that its every effort is bent toward the increase of its always enormous earnings.

The fact that the big corporation's publicity bureau now is employing the public prints in an effort to throw dust in the public eye suggests many things, but nothing so strongly as the extent to which the means of obtaining publicity have been developed and the ends which it may be made to serve, which in turn suggests that the responsibilities of those who have to do with public prints have been enormously increased.

The big corporation, the stock jobber, the get-rich-quick men and every other type of promoter and speculator is aware how easily publicity without cost is now obtainable and much devilish ingenuity is being exercised in the effort to obtain it and thereby favorably impress the public. Indeed, press-agentry has become such a fine art that the publication which does not exercise keen discretion and which is easily overpowered by the influence of its advertising department is likely to be made a tool of selfish interests whose chief aim is plucking the public, instead of remaining the advocate and defender of the public.

It is regrettable that the press agent, and the advertisement which is supposed to lie back of him, have been permitted to become so potent in the offices of so many supposedly powerful publications.

INCREASING DEPTH OF UPHOLSTERY.

Although the gradually deepening seat cushions which form one of the very prominent features of nearly all of the cars in the newer crop can be condoned, if not lauded, as a well-directed step to increase the comfort of passengers, it would seem that there is a logical limit to the increase in thickness and that the limit is not, as might be supposed, the floorboards of the car. In other words, the limit of thickness might be expressed in terms of durability. At any rate, the length, or rather the depth to which the thickening has been carried in some instances suggests a problem in which luxury and ability to withstand hard wear appear as factors of no little prominence.

Quite naturally, thick cushions can be expected to make for easier riding and greater bodily comfort than can thin cushions, provided, of course, that the thick ones are as resilient as their dimensions suggest them to be. But, on the other hand, a degree of resiliency presupposes a corresponding degree of vertical movement, which, in turn, results in an increase in wear which may be expected to reduce the natural life of the upholstery to an extent depending upon the quality of the materials and other influencing factors, such, for instance, as friction, both internal and external.

Hence, the limit of thickness becomes apparent and should be governed as much by durability as by luxury if the mental and financial as well as the physical comfort of the owner is to be catered to.

January 20-25, Philadelphia, Pa.—Philadelphia Automobile Trade Association's exhibit in the garage of the Automobile Club of Philadelphia.

January 20-25, New York, N. Y.—Automobile Board of Trade's 13th annual show in Madison Square Garden and Grand Central Palace. Commercial vehicles only.

January 21-26, Toledo, Ohio — Annual show in the Exposition building under the auspices of the Toledo Automobile Shows Co.

January 25-February 1, Montreal, Can.—Show in the Drill Hall under the auspices of R. M. Jaffray.

January 25-February 1, Providence, R. I.—Annual show of the Rhode Island Automobile Dealers' Association in the Providence State Armory.

January 27-February 1, Waterbury, Conn.—Waterbury Automobile Dealers' Association's second annual show in the Auditorium.

January 27-February 1, Ottawa, Can.—Annual show of the Ottawa Valley Motor Car Association in Howick Hall.

January 27-February 1, Detroit, Mich.—Detroit Automobile Dealers' Association's Show in the State Armory.

January 27-February 1, Philadelphia, Pa.—Philadelphia Automobile Trade Association's exhibit in the garage building of the Automobile Club of Philadelphia. Commercial vehicles only.

January 27-February 1, Rochester, N. Y.—Fifth annual show of the Rochester Automobile Dealers' Association in Exposition Park.

January 27-February 1, Rochester, N. Y.—Rochester Automobile Dealers' Association's fifth annual show in Exposition Park.

January 27-February 1, Buffalo, N. Y.—Buffalo Automobile Dealers' Association's eleventh annual show in the Broadway Auditorium. Pleasure cars only.

January 27-February 1, Scranton, Pa.—

February 3-8, Washington, D. C.—Washington Automobile Show Co.'s exhibit in Convention Hall.

February 8-15, St. John, N. B.—First annual show of the New Brunswick Automobile Association in the Drill Hall.

February 8-15, Youngstown, Ohio—Annual show of the Youngstown Automobile Show Co. in the Auditorium and Annex.

February 8-15, Hartford, Conn.—Sixth annual show of the Hartford Automobile Dealers' Association in the State Armory.

February 10-15, Minneapolis, Minn.—Minneapoils Automobile Show Co.'s show in the National Guard Armory.

February 10-15, Chicago, Ill.—National Association of Automobile Manufacturers' 12th annual show in the Coliseum and 1st Regiment Armory. Commercial vehicles only.

February 12-15, Geneva, N. Y.—Annual show in the State Armory, under the auspices of the Ottawa Valley Motor Car Association.

February 15-22. Albany, N. Y.—Annual show of the Albany Automobile Dealers' Association in the State Armory.

February 15-22, Newark, N. J.—New Jersey Exhibition Co.'s Sixth annual exhibit in the First Regiment Armory.

February 16-23, Richmond, Va.—Richmond Automobile Dealers' Shows Co.'s exhibit in the Horse Show building.

February 17-27, Kansas City, Mo.—Kansas City Automobile Dealers' Association's show in Convention Hall. First week pleasure cars; second week commercial vehicles.

February 19-22, Davenport, Ia.—Annual show of the Tri-City Automobile Dealers' Association in the Coliseum.

February 19-22, Oshkosh, Wis.—Oshkosh Automobile Dealers' Association's second annual show in Armory B.

February 20-22, Canandaigua, N. Y.—Motor Car show in Hawley's Garage, under the management of A. Blumenstein.

February 22-March 1, Brooklyn, N. Y.—Brooklyn Motor Dealers' Association's third annual show in the 23rd Regiment Armory.

February 24-March 1, Omaha, Neb.—Omaha Autmobile Dealers' Association's annual show

March 1-8, Paterson, N. J.—Second annual show of the Paterson Automobile Dealers' Association.

March 3-8, Pittsburgh, Pa.—Pittsburgh Automobile Dealers' Association's show in Duquesne Garden.

March 3-15, Des Moines, Ia.—Des Moines Automobile Dealers' Association's fourth annual show in the Coliseum. First week pleasure cars; second week trucks.

March 8-15, Boston, Mass.—Boston Automobile Dealers' Association's annual show in Mechanics' Hall. Pleasure cars only.

March 10-15, Dallas, Tex.—Annual show of the Dallas Automobile Dealers' Association in the Fair Grounds Coliseum.

March 19-25, Boston, Mass.—Boston Commercial Vehicle Association's annual show in Mechanics' Hall.

March 20-24, New Orleans, La.—Annual show of the New Orleans Automobile Dealers' Association.

Buick Reports Twelve Million Assets.

According to its annual statement, filed with the Secretary of State of Michigan on December 10th, the Buick Motor Co., of Flint, possesses assets amounting to $12,271,200, which represents an increase of $1,164,596. Its liabilities on the same date, exclusive of its surplus, totalled $5,676,882. Its surplus account, of course, figures as a liability—$6,594,318, an increase of $90,628. The details of the several items are as follows:

	1912.	Increase.
Assets—		
Merchandise	$4,581,629	$298,029
Cash and debts receivable	2,814,865	47,150
Investments	1,821,324	*1,219,760
Other assets	3,053,382	2,039,168
Total	$12,271,200	$1,164,596
Liabilities—		
Capital stock	2,500,000	.....
Accounts payable	1,430,915	760,077
Other indebtedness	1,745,967	313,891
Surplus	6,594,318	90,628
Total	$12,271,200	$1,164,596

Willys Contributes $150,000 for Highway.

John N. Willys has added his weight and $150,000 of his money to the trans-continental road projected by Carl Fischer and J. A. Allison of Indianapolis. Willys made his contribution while in New York one day last week. It is to be paid in three yearly installments of $50,000 each.

CAR INSURANCE RATES CUT 10 TO 30% FOR FIRST YEAR

New Schedule Effective February 1 Lessens Cost of Insuring New Cars—Second Year Rates Higher—Changes as Planned.

On February 1 there will become effective with practically all fire insurance companies in the East a schedule of automobile insurance rates which is considerably lower in certain respects than that which now prevails, the new schedule having been adopted last week at a meeting of the Automobile Underwriters' Conference, in New York City, and proving very much a surprise in that no inkling of the proposed revision had reached even many well-informed insurance brokers.

The rates as revised will be followed by all those companies which insure cars, with one or two exceptions, and are said to have been compelled to forestall competition in the car insurance line, which is looming up before the established insurance companies in the form of new corporations formed for this particular line of business The principal change is effected by the creation of two separate classes to replace the one at present in use—one for new cars in their first year of service and the other for cars which are being used a second year by the same owner, or used cars which are being used in either their first or second year of service. For used cars of greater service the actual value is taken into consideration, but for the first named the original list price is the basis of estimate. The figures disclose a lot of that fine hair-splitting peculiar to the insurance business.

Class No. 1 of the new rates is from about 10 to 28 or 30 per cent. lower than the old one-class rate classification. The tables are divided into twelve divisions, according to value, the lowest being $700, whereas the old table ran one division lower—namely, $500 to $699. Also the new Class 1 table does not permit so small an insurance as heretofore, for instance, where a $6,500 car previously might carry as low as $2,000, it will be able to take not less than $3,000 under the new rates. The changes vary and the amounts of insurance now run from $500 to $6,500 and up in 19 divisions, where previously there have been 18 graded from $400 to $6,500 and up.

Class No. 2 is graded as the same as the class which formerly was the only one in use, except the $500-$699 valuation has been dropped, but the rates have been slightly raised; on cars costing from $3,500 to $6,500 and up there is no change, but on cars listed between $1,500 and $3,500 there has been an increase of about 10 per cent., and on the $700-$1,500 class there are raises of from 9 to 13.6 per cent. To illustrate:

Under the old, or present, rules a car costing $2,500 could carry $2,500 of insurance for the first and second years for 2½ per cent., or $62.50. Under the new rules it can carry $2,500 the first year for 2 per cent., or $50—a reduction of 20 per cent. For the second year, under the new rules, it may carry this same amount of insurance at a rate of 2¾ per cent., or $68.75, an increase of 10 per cent.

Slightly different than under the old rules, if an owner desires to accept a policy in which the value of his car is not predetermined and in which the theft clause is not incorporated, he may secure a reduction of ⅛ per cent. on cars in Class No. 1 and ¼ per cent. on cars in Class No. 2. The old reduction was ¼ per cent. for the elimination of the non-value clause for all cars and ½ per cent. for the dropping of the theft paragraph on first year cars and ¼ per cent. on all other cars.

Several flat rates are included, as follows: Class No. 1, 2⅜ per cent. for cars under $700, with a minimum premium of $12.50; Class No. 2, 3⅛ per cent., with the same minimum of $12.50; electric cars, 1½ per cent., with reductions of ⅛ per cent. for the elimination of theft and value clauses. Commercial cars fall within Class No. 2.

Claims Five Tire Treads Are "Unfair."

Despite the fact that its application for a patent was not pressed to issue, the Batavia Rubber Co., of Batavia, N. Y., manufacturer of the "Security" tread, has inaugurated a movement to prevent general use of its design. Thus far the company has not gone into court, but last week served notice upon five tire makers, advising them that they were using imitations of the "Security" tread and that the Batavia company would wait a reasonable length of time for notification that the manufacturers notified will "cease further infringement." Action will be taken under the "Unfair Competition" law.

The companies notified are the Seamless Rubber Co., New Haven, Conn., maker of the "Safety" tread; Kelly-Racine Rubber Co., Racine, Wis.; United & Globe Rubber Cos., Trenton, N. J.; Stein Laplock Tire Co., New York City, and the C. H. Stoddard Rubber Tire Works, of Worcester, Mass. The notification states that the imitated treads tend to deceive the public and that the manufacturers "will be held accountable for any damages which the Batavia Rubber Co. may sustain because of unlawful infringement." The "Security" tread, which has been employed for several years, consists of depressions in the tread at each side of the center, in appearance like cuts.

S. A. E. BANQUET ASSUMES UNEXPECTED PROPORTIONS

Ballroom of New York's Newest Hotel Too Small and 25 Floors Separate Diners—Clever Skits in Print.

Almost, but not quite, drawing to a close the winter meeting of the Society of Automobile Engineers, the ninth annual dinner, which was held on Friday night, 17th inst., in New York's newest hotel—the McAlpin—proved all that its sponsors hoped it would prove, and more. Altogether, some 400 members and guests were seated, and not even the fact that the unprecedented demand for tickets caused a slight alteration of the original plans, which provided seats for all in the grand ballroom on the 24th floor, and necessitated that 20 tables be ranged 25 floors lower down, in the Grill Room, prevented the dinner from being a great big "get together" that afforded an opportunity for much jollification and a general renewal of acquaintance.

The principal section of the dinner was in the ballroom, of course, where the Council was seated at the first table. Although the first table nominally is styled the speakers' table, the designation scarcely was a good fit, for the few words that were spoken hardly could be called speeches. Howard Marmon, of Nordyke & Marmon Co., Indianapolis, Ind., newly elected president of the society, addressed the meeting very briefly and, after praising the work that has been done in past years, outlined the objects to be attained in the future. Professor F. R. Hutton and the retiring president, H. W. Alden, also addressed the gathering very briefly, both of their speeches, if they may be termed such, being tinged with the humor that everywhere was apparent .

Despite the separation that placed upward of 150 members and guests below the street level, it had no appreciable effect on their good spirits, as was evidenced by concerted efforts to out-sing a troupe of colored cabaretists and to have a good time in general, though it was not an altogether quiet one. Upstairs, where the newly elected officers were seated, jubilation was only slightly less apparent, and at both sections laughter loud and long followed the distribution of the latest issue of the S. A. E. BULLetin, a more than ordinarily clever skit on the bona fide bulletins issued monthly by the society, that was delivered to members and guests with the printed instructions that it was "loaned by the entertainment committee."

As for the dinner itself, it was a fearful and wonderful affair, according to the Eng-

Digitized by Google

lish meaning given to the names of the dishes as they appeared on the menu in French and even though menus, as a rule, are uninteresting, except to those who translate them with the ultimate object of satisfying their appetites or their curiosity, the entertainment commimttee evidently had little difficulty in making this particular menu instructive as well as interesting. Under the caption, "An explanation of what you have eaten," the various courses were described in the BULLetin as follows:

Hors D'Oeuvres Varies — Otherwise known as delicatessen with an expensive name.

Huitres — Bivalves-poppet—Smooth-sliding and some rotating, otherwise called oysters, generally scarce in a New York stew.

Veloutte Fanchonette—Soup made by a Frenchman and eaten by an engineer. (All that the name implies.)

Paupiette de Bass—Part of a fish. (Ask the man who owns one.)

Ris de Veau Sapho—Never mind the first, the last sounds reasonable. (We guarantee the service.)

Poussin de Hambourq—Perrigourdine—Ordinary stockyard meat. The Q is silent as in billiards.

Bombe Gismonda—Sounds like starting a Pierce.

Petits Fours—The sixes have been neglected.

Cocktails—(A little goes a long way and every drop counts).

Champagne a la Carte—See the accessory salesmen.

Among other things equally entertaining, including a number of really clever cartoons of men prominent in the trade, one of which depicted Henry Ford smilingly watch Ford "birds" hatch and fly off to England, with John Bull standing on the shore "shooing" them off, the BULLetin contained "advertisements" quite as a matter of course. And even though the "ads" were fictitious, that the humor displayed in them was subtle in more than one respect may be judged by the quarter page "announcement" of "W Flounders"

I will start you in Business

Build a big factory for you and tell you how and where to sell it

Room section repaired to the Ballroom, where the tables were cleared away and the engineers, were entertained in a body by a vaudeville show of six numbers that was "tailed off" by the "Farber Sisters—Just Out of a Show Limousine," who had no difficulty in extracting the square root of four with a slide rule, but who balked at extracting the cube root of Moscovic's nerve with the same instrument.

Those who were seated at the Council table were Howard Marmon, H. W. Alden, Robert McA. Lloyd, Howard Coffin, Henry Souther, E. T. Birdsall and Prof. F. R. Hutton. The first table was occupied by Secretary Coker Clarkson, A. B. Cumner, Merle L. Downs, A. L. McMurtry, H. C. Wilson and Axel Ames.

Two Injunctions for Weed Chain.

Although the W. E. Pruden Hardware Co., of 864 Eighth avenue, New York City, promised to "be good" when the Weed Chain Tire Grip Co. sued it two years ago for alleged infringement of the Parsons patent, No. 723,299, and persuaded the Weed people to withdraw the action, the hardware concern seems not to have kept within the straight and narrow path, for Friday last, 17th inst., the Weed company, in the United States District Court for the Southern District of New York, sued again and was given an injunction against the Pruden company; the order restrains it from selling cross chains and other parts, not licensed under the Parsons grant.

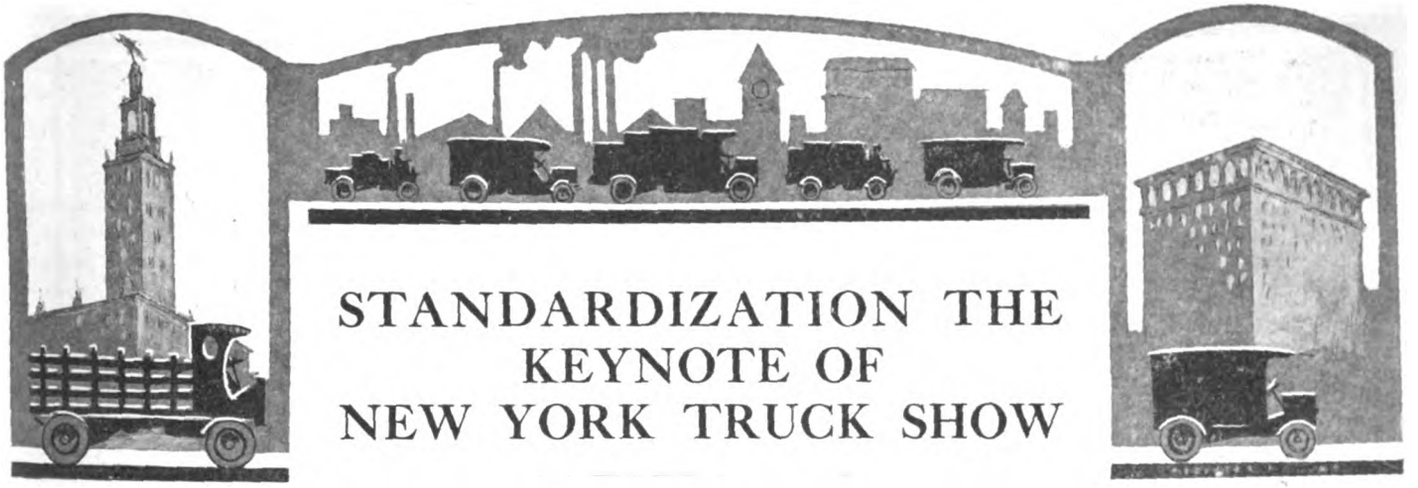
On the same day the District Court issued an order in the suit of the Weed company against the Q. D. Hook Co., Edwin S. Holmes, Jr., Randoph T. Warwick and others, enjoining them from manufacturing the Q. D. cross chain, cross chain hook and other parts, adapted and intended for the repair of chain grips. The Q. D. company is said to have been organized in Washington, D. C., for the purpose of manufacturing and marketing these parts under a patent granted to Edwin S. Holmes, Jr. The Q. D. company exhibited its goods in Grand Central Palace during the opening days of the present New York show.

"35%" Scores Point on Pedal Maker.

Despite the fact that the Personalty Liquidating Co. was victorious in its suit against the 35% Automobile Supply Co. in claimed came within the scope of payment on one of the latter's now famed advertising contracts. The Pedal company, however, claimed the goods, the value of which was the basis of the suit, were extraneous to the contract.

Unusual Turn to Used Car Transaction.

The used car problem has assumed for L. M. Rosenthal, a New York shoe merchant, an angle which is rather unusual, but he has secured a decision in the New York City Court which causes him to be fairly well satisfied with the problem's solution. His trouble began when he took a used Knox car to the Rodney K. Haines Co., a metropolitan used car concern, and asked that it be sold for him. The Haines company alleged that it did not take the car in to sell, but actually bought it, giving therefor a Marquette car and getting certain money "to boot." When the car was not sold Rosenthal demanded its return, and the suit resulted in an order to the Haines company to return to him his car or else pay him $500. Rosenthal is equally well satisfied either way. Also, the Haines people must pay the costs of the action, which amount to $118.93.



Dyer Settles with Six Defendants.

Six suits against alleged infringers of the Dyer transmission patents, Nos. 835,986 and 921,963, instituted in the United States District Court for the Southern District of New York by the Enterprize Atuomobile Co., holder of the Dyer patent, were discontinued this week, after having been practically ended by settlement several weeks ago; the defendants were the Palmer & Singer Mfg. Co., Ducasse & Co., C. A. Glentworth, Washington Garage Co., and two taxicab men named Comiskey and Cooper, all of New York City.

Trumbull Enters Hartford Auto Parts.

John H. Trumbull, president of the Trumbull Electric Co. of Plainville, Conn., was elected a director of the Hartford Auto Parts Co. of Hartford, Conn., at its annual meeting last week. He succeeds Thomas H. Brady, of New Britain. The directors re-elected are as follows: William H. Cadwell, Dr. J. J. Andzulatis and Charles Mueller of New Britain, and Andrew J. Broughel of Hartford.

STANDARDIZATION THE KEYNOTE OF NEW YORK TRUCK SHOW

Vehicles Disclose No Lack of Individuality But Trend Toward Certain Standards Is Plain—Notable Developments in Tractors, Dumping Mechanisms and Removable Units—Worm Drive Gains—Several Surprises.

Few of the nearly 200,000 persons who last week visited Madison Square Garden and Grand Central Palace to view the Automobile Board of Trade's display of pleasure cars and accessories witnessed the real "action" of the show; for the "action" occurred between 11 o'clock Saturday night and six o'clock the following Monday evening, 20th inst. There was lots of it, but it was not spectacular "action"; it was too heavy to be spectacular. It was contained in the moving out of the 325 cars and chassis and more than 100 exhibits of accessories, and moving in of 236 trucks and chassis, most of them big fellows, to say nothing of the rapid changes of signs and other appointments.

When the Big Doors Were Thrown Open.

The truck show—Part II, it is officially denominated—was formally inaugurated at eight o'clock Monday evening, but the heavy work had been so well performed that the display contained no suggestion of it to even the most interested visitor. Everything was in spick and span order, and though the effect is not so beautiful to behold as during the previous week, the vehicles on display are really more picturesque. There are big trucks and little wagons, huge dump carts, ambulances, hearses, fire engines and what-not, no two of them appearing alike, at least so far as external appearance is concerned; and though their surroundings—mirrors and white statuary, and crystal chandeliers and rose garlands in Madison Square Garden, and marble columns, lattice work, and poinsettias and scenic paintings in Grand Central Palace—though these surroundings are strange and suggest drawing rooms rather than a setting for dump carts and the like, the dump carts and most of the others care not at all. In fact, few of the spectators appear to notice the incongruity. And there were full houses in both buildings Monday evening, although since that time the numbers have been considerably diminished.

Plenty of Room and Some to Spare.

What most impresses those who witnessed Part I is the great increase of elbow room in Part II. There is more than room enough for all. In fact, in the Palace there are no exhibits whatsoever on the second floor. It is practically in darkness, and the comparatively few accessory exhibitors on the floor above have reason to be unhappy. Not many visitors are aware of their existence and few wend their way upward.

The outgoing of accessory exhibitors in both buildings amounted almost to an exodus. In the Garden, that beehive of industry termed the basement was depopulated, and but for the entry of less than a dozen machine tool exhibitors who occupy a very small part of the "lower region" it would be deserted. In the Palace, as stated, the second floor really has been deserted, and the top floor, previously crowded, is now but a shadow of its former self.

Standardization and No Freaks.

The dominant note of the double show is a note of unity—of getting together—of agreeing upon certain systems and methods that have been tried in former years. There is a mechanical sameness and an amount of repetition that would be monotonous if not relieved by variations in detail. Manufacturers who have settled down to a standard that has been unchanged, except in detail, in years, form a group that is increasing so rapidly that it soon will be difficult to say which is the "group" and which the others. All of which is directly in line with the "prophetic view" taken of the show in the Before Shows number of Motor World, and indicates, not that there is any falling off in the ingenuity of designers, or any lack of originality or initiative, but that the fittest is surviving and the rest is not.

What Makers Had "Up Their Sleeves."

Every show is livened up and "spiced," so to speak, by a few unexpected exhibits that manufacturers keep in the dark until the doors open. The present exhibition is no exception to the rule; it has its "surprises" and, by the same token, the surprise that has been sprung by the Studebaker people amounts almost to a shock. While it has been known for some time that the famous corporation has been quietly working on a gasolene commercial vehicle, the exact character of the design was unknown, and when the uncovering at the Palace revealed a final drive through internal gears and other details to match—and, further, when the gasolene car was flanked by a brand new electric with worm drive direct to the rear axle, the surprise was thorough and complete. And still further, the machines shown are not isolated models; they are merely representative of two complete lines, ranging, in the case of the gas car, from 1 ton to 6 tons, and in the case of the electric from 1 ton to 5 tons carrying capacity.

The gasolene Studebaker is a big, substantial machine in its general make-up, and the framing is particularly well braced by heavy end members and gusset plates. The most conspicuous feature of the machine, however, is its final drive, which is of the internal gear type that is so rapidly gaining

Digitized by Google

MADISON SQUARE GARDEN AS IT APPEARS WITH THE TRUCKS IN PLACE OF THE PLEASURE CARS

Digitized by Google

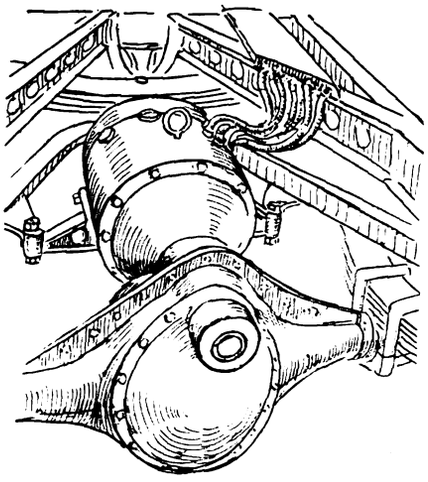
ground for commercial work. There is a live axle bevel-gear driven from the propeller shaft in the usual manner, and driving by means of pinions to internal gears enclosed in housings on the rear wheels; the driving shafts and their housing carry none of the weight of the car, which is supported by a separate "dead" axle of rectangular steel.

Another feature of the car is the clutch, which is designed, among other things, to wear about as long as its services are likely to be required. It is of the internal expanding type, bronze shoes, with grooved bearing surfaces, expanding against the interior of the extended flywheel rim, which is correspondingly grooved. The wear on the metal-to-metal surfaces is said to be extremely slight, in addition to which there is sufficient stock so that there is room for a total wear of ⅛ inch, measuring diametrically. After considerable experimenting with various types of clutches the Studebaker company, it is stated, decided upon this form not only because of its wearing qualities, but because of its extremely smooth working under all conditions.

The gearset has four speeds, selectively controlled, and is separate from the motor. The service brakes are on drums on the rear wheels, and the emergency brakes, on the driving shaft just forward of the bevel gear housing, consists of two bands contracting on a broad drum, actuated by cams which, when partially rotated by the operating rods, force the ends of the bands together. Adjustment for wear is effected by means of a large wing-nut on each brake, turning the nut shortening the distance between the ends. No tools are required and the nuts lock automatically in position.

In the worm driven electric the motor is mounted as a unit with the rear axle, the casings being bolted together, close-coupled, so to speak; the front end of the motor is supported by the converging radius rods, which come together at a cross frame forward of the motor and take the driving stresses. The control lever arrangement savors strongly of gasolene car practice; the emergency brake and controller levers both are in the center, and look much like the brake and gear levers of a gas car. There is an interlocking device whereby the controller lever automatically flies back to neutral if it should be in an "on" position when the emergency is applied, so that a sudden stop may be made with a single movement—a straight pull on the emergency brake lever.

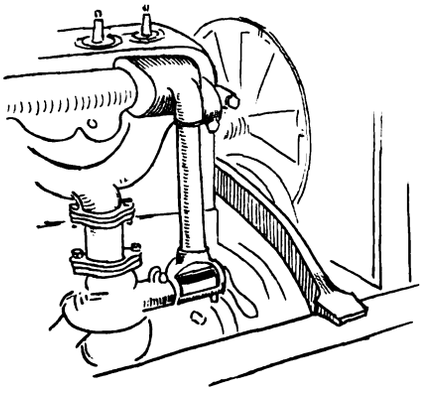
TWO OF THE HEAVIEST VEHICLES IN THE SHOW—SMITH WORM-DRIVEN CHASSIS IN THE PALACE



Surprises in the Light Brigade.

There were two other surprises, one of which, to use a Hibernianism, was not unexpected, while the other was quite unlooked for. One is the Buick light parcel wagon, which has been "on the stocks" for some time, but which hardly was expected to be ready for the show and was kept very much out of sight in the meantime; it is distinctive, as a Buick, in that it has an L-head motor, all other members of this family having valves in the cylinder heads. The wholly unexpected machine is the product of the International Motor Co., of New York, which embraces the Hewitt, Saurer and Mack concerns; the new car, a four-cylinder gasolene light wagon of 1,500 pounds capacity, is different from all three of these machines and bears the name International.

The most conspicuous feature of the new Buick, barring its solid and substantial construction, is the careful manner in which the accessibility of parts has been worked out. Thus, for instance, the propeller shaft is enclosed in a heavy torque tube hung at the front end to a cross chassis member in such a way that it quickly and easily is demountable without the necessity for disturbing other units. Similarly the clutch unit and the gearset unit can be lifted out integral almost instanter. The gearset, by the way, provides three forward speeds and reverse, selectively obtained, and the gear shift lever is "let into" the gear box through an ingenious ball and socket joint which precludes the possibility of dirt finding its way into the "works" and at the same time eliminates the necessity for a gate change. Another interesting feature which reveals substantial construction is the manner in which the steering column is braced to the dashboard; it may be used almost as a trapeze by the driver without fear of its derangement.

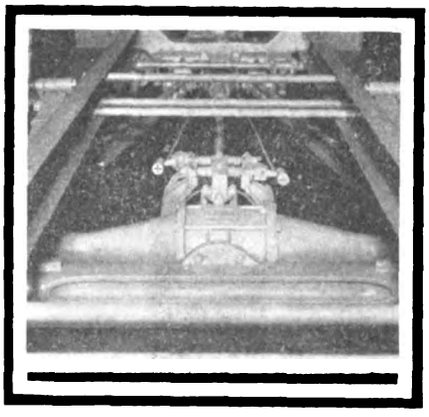


Digitized by Google

Not content with any half-way measures in the formal adoption of an L-head motor, Buick engineers have gone even further and have provided probably the maximum of internal accessibility by making the cylinder heads, or rather the cylinder head—for the motor is cast in a single block—detachable. The bore and stroke measure 3 x 5

STUDEBAKER MOTOR SUSPENSION

inches, and though the S. A. E. rating thus is comparatively low, the actual power developed is in the neighborhood of 23 at 1,500 revolutions a minute. A governor is fitted, quite as a matter of course, and though it is of the adjustable variety, once adjusted for the desired speed, it cannot be tampered with without the knowedge of the owner. Conforming to the natural tendency, he steering wheel has been placed at the left side with the control levers in the center

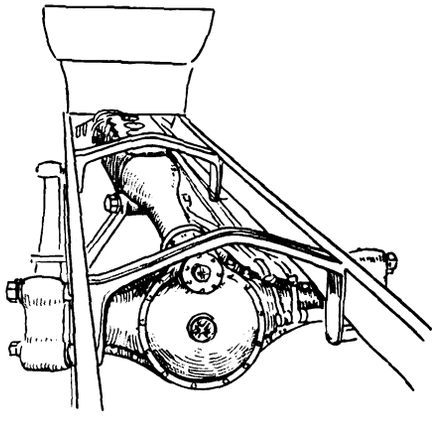


UNIVERSAL CARBURETTER ADJUSTMENT

of the footboard. Although but the one size is made at present—1,000 pounds—plans include the addition of another, rated at 1,500 pounds, in the very near future.

In the new International, the makers have attempted and achieved the production of a fairly light delivery wagon capable of high speed carrying comparatively heavy loads, and the most starting feature of the whole design is that there is nothing startling in its make-up—unless the use of a very long stroke motor and a four-speed selective gearset can be styled startling; in the fewest possible number of words, it is a standard vehicle throughout and is unusual only in the employment of cushion tires in the rear, where all of the load carried by the vehicle is supported, and pneumatic tires in front to permit a somewhat better cushioning of the shocks which otherwise would be transmitted to the motor. The motor is arranged forward under a hood, after the manner of the pleasure car, and therefore is conspicuously accessible; its bore and stroke are 3½ and 5½ inches, respectively.

Perhaps the most notable of the inevitable "tendencies" that are looked for at every show and that never fail to turn up, is the marked favor which is shown to left-side steering, which seems to have established itself even more firmly than was expected, inasmuch as some 55 per cent. of the exhibitors at the two divisions of the show in

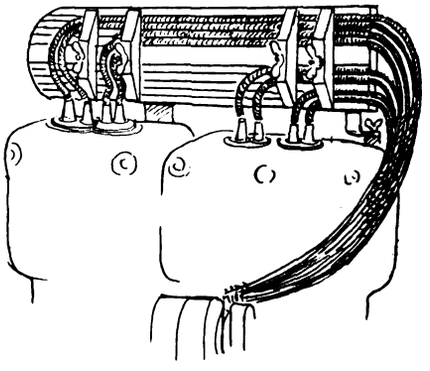


STUDEBAKER REAR AXLE

New York have steering wheels on the left side—and those who go to the left stay there. It is probable that the approaching Chicago show will include an even greater proportion of this type. As might be expected, the older and more conservative makers are usually the slowest about making such changes, while the less firmly established concerns cross the seat with little or no hesitation, once they are convinced; and the newcomers, as a rule, seem to favor left steering.

While there are a few instances of distinct and uncompromising individuality — by which nothing implied by the term "freakish" is meant—there is a much more marked inclination on the part of manufacturers to form groups, in a sort of involuntary way—that is, several makers will work along the same general lines, each working out some principle in his own way. Just what is meant by this is very well exemplified by the worm drive contingent, which includes seven manufacturers—Pierce, Studebaker, Smith, Rowe, Universal, Blair, and Schacht. All are gasolene cars with the notable exception of the Studebaker electric.

Flanking the new International delivery wagon, there is the usual formidable array of other International products, of course, the clean-appearing and business-like Saurers, which scarcely have changed at all in the past twelvemonth; a massive 10-ton Hewitt, which, as usual, is the largest vehicle in the show, and which certainly has not changed a bit since last it appeared, and the capable-looking Macks—a whole battery of them, including the familiar power dumping



SMITH-MILWAUKEE TRANSMISSION

truck that made its appearance at the last show.

But whereas the Mack dumping truck was one of only a few of the kind at the last show, at the present show it is one of a fairly large number. No less than eight makers exhibit vehicles of the kind, several of them being brand new, to say nothing of three or four more who show heavy trucks that are dumped by hand-operated mechanism.

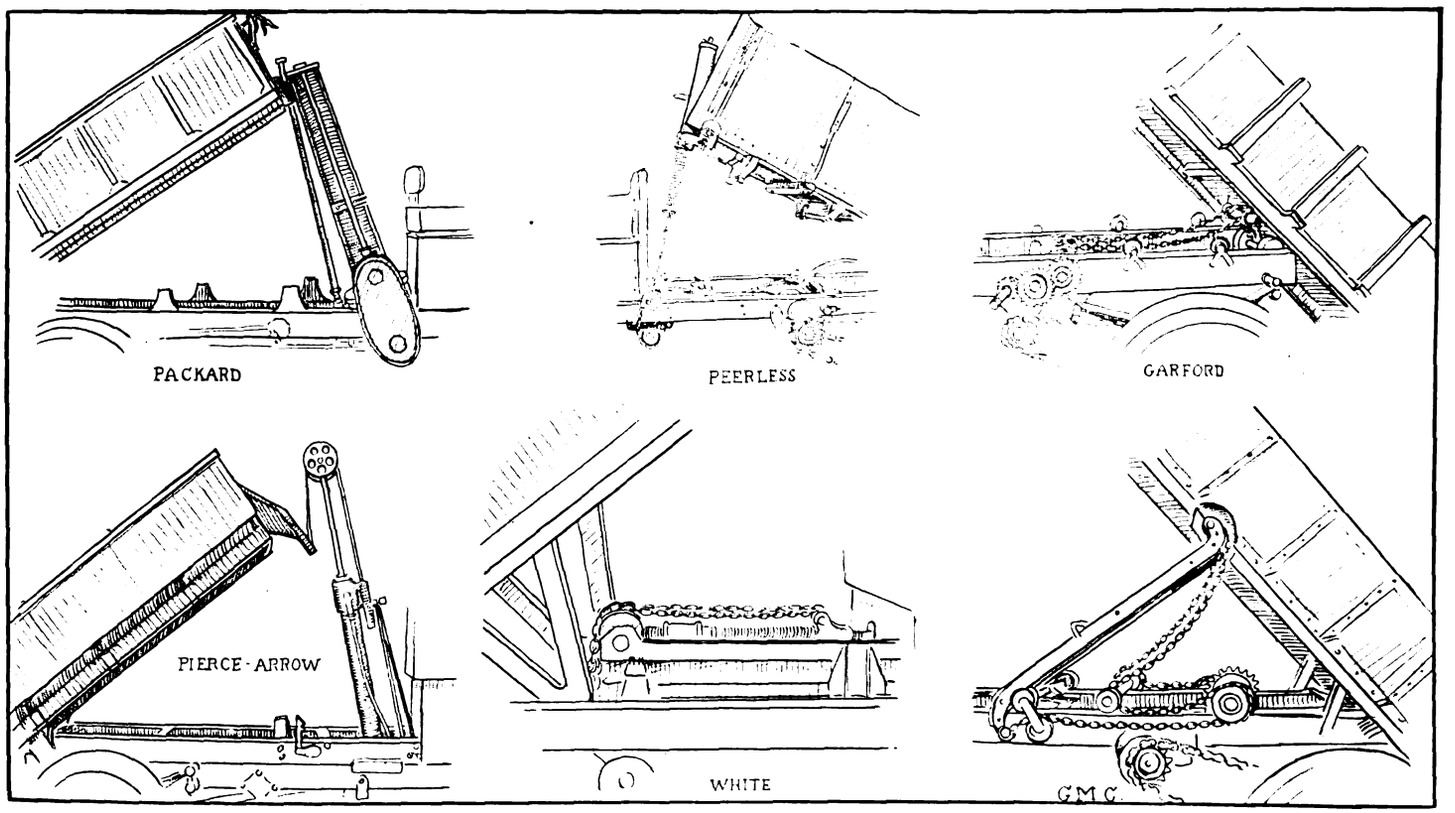
That power driven mechanism is much

VULCAN IGNITION WIRING

preferred, however, probably by reason of the fact that plenty of power for the purpose always is available, is evidenced by the Pierce-Arrow truck, for instance, which last year was dumped by hand but which this year has been equipped with an unusually simple and smooth-operating hydraulic apparatus which makes no bones whatever about hoisting up a five-ton load in a jiffy.

In working out the design of the Pierce-Arrow hoist, cognizance has been taken of the fact that it is undesirable for the hoist-

Digitized by Google



ing apparatus to protrude above the height of the driver's cab, if possible damage by collision with low-hung structures is to be avoided, and for this reason a system of leverage is employed which imparts to the body twice the motion of the elevating plunger. In its simplest aspect, the elevating gear complete consists of a hydraulic ram in which oil is used as a medium, the oil being contained within the cylinder of the ram at all times. When the driver pulls a small lever conveniently located at his right hand, a small but substantial rotary pump geared to the transmission through the intermediary of a chain, is set in motion and pumps the oil beneath the ram from above it, where it normally is contained when the body is lowered and at rest. The oil, under pressure, forces the piston up until the top of the stroke is reached, at which time a strike plate opens three valves in the piston, allowing the oil to escape freely into the top portion, thereby holding the body at rest. Needless to point out, the body may be stopped in any intermediate position merely by stopping the oil pump. Except for the addition of the power dumping model, and a few minor alterations such as the use of slightly heavier springs and a larger radiator, the Pierce-Arrow line is much the same as it always has been and, as usual, it is one of the few worm-driven vehicles on view. A new steel tool box has been added, however, that is unusually roomy and is calculated successfully to withstand the assaults of thieves of any or every variety.

Telescoping Type of Screw Dump.

Among the screw dumping bodies, the Peerless is unusual in that a double screw is employed—one screw telescoping within the other. The screw is turned by a set of bevel gears driven by chain and sprocket. The sprockets are in turn operated by another bevel gear driven from the transmission counter shaft. The mechanism is set in motion by a lever in the driver's compartment. The peculiar advantage of this particular construction, of course, is that when the body is lowered, the screw does not project above the cab; incidentally, except when the body is raised, when the screw is protected by the body itself, no harm can come to the hoisting gear for the reason that it is completely enclosed within a tight tube. Immediately the body reaches its limit of elevation, an automatic stop prevents damage to the mechanism. As for the other trucks in the Peerless exhibit, they reflect the familiar Peerless construction, which has solidity and simplicity as its two most conspicuous features. Scarcely a change worthy of note has been made since last they were exhibited.

Similarity in Two Different Makes.

The Packard hoisting mechanism, exhibited on a three-ton chassis, is not altogether unlike the Peerless apparatus in that it also is of the screw variety. It differs from the other, however, in that there is but a single screw, though like the other it is operated through enclosed gearing by the engine. In its simplest aspect, the mechanism consists of an enclosed screw upon which there is, for simplicity in explanation, a large nut connected to the front end of the body. As the screw is rotated by the engine, the nut worms its way upward, or downward, according to the direction of rotation of the screw, and carries the body with it. The operating lever is placed at the driver's left hand and the mechanism is equipped with an automatic stop to limit its travel.

STUDY OF TRUCK DUMPING MECHANISMS SHOWING SEVERAL SOLUTIONS OF THE PROBLEM

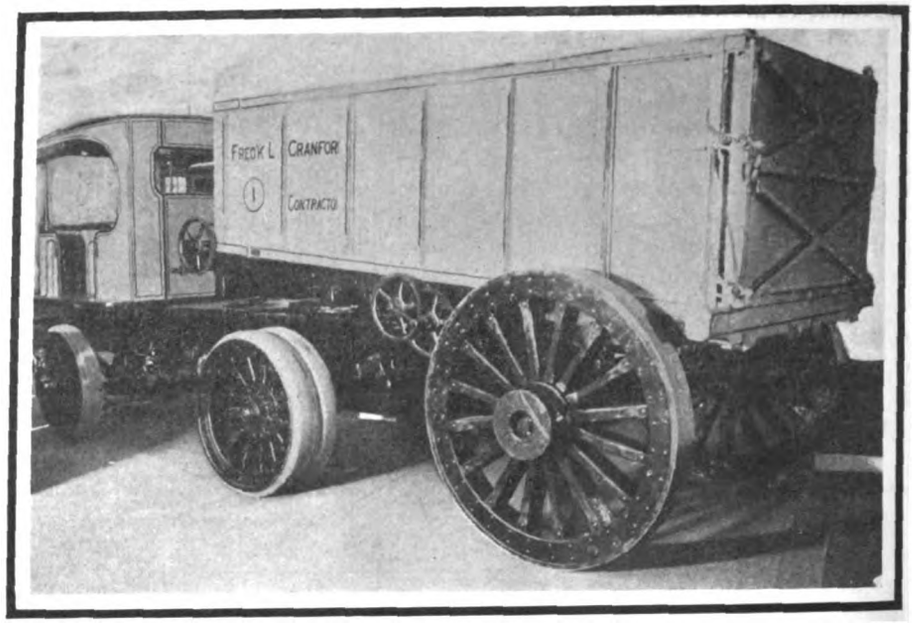
Although the Packard dumping mechanism is exhibited on a three-ton chassis, which, by the way, is almost exactly like its predecessors, ilttle room for improvement having been found, it may be applied also to the new five-ton vehicle, the first of which makes its initial appearance at the show. Contrary to any expectations which might have been engendered, the new Packard differs in no way from the two- and three-ton vehicles which in past years have established the Packard reputation for reliability and service. It is larger, of course, though there can be no mistaking the Packard earmarks. Another almost equally interesting exhibit at the Packard space is a large van constructed for the United Cigar Stores Co. It contains humidors.

The Alco dumping arrangement is entirely different from any of the others,

Digitized by Google

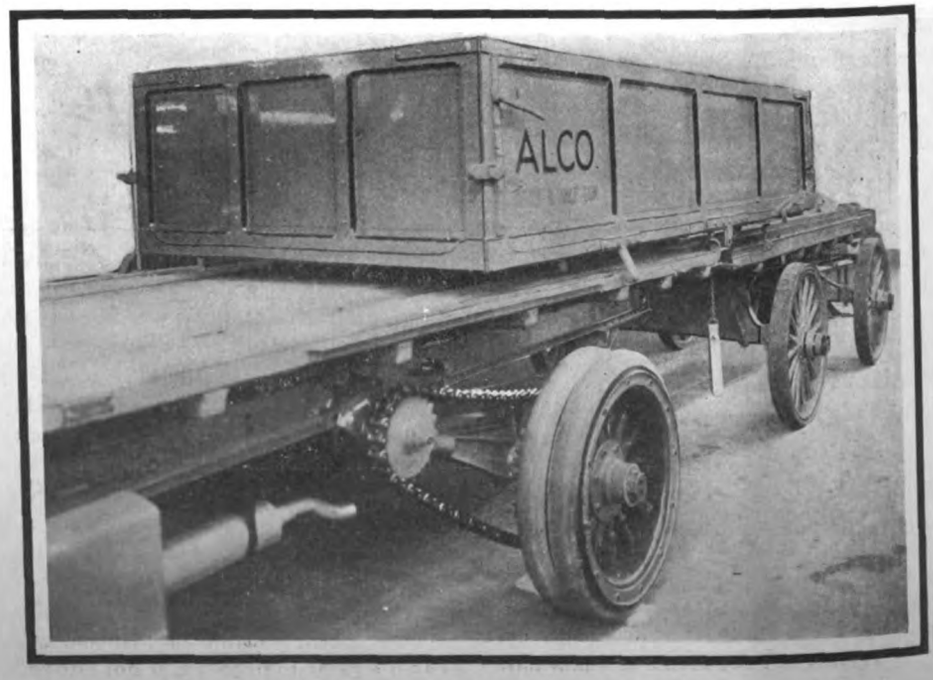
though its operation depends upon the rotation of a great, heavy screw. The screw, however, is placed beneath the body, longitudinally, and is operated by gearing from the driving shaft. Heavy chains which wind up on the worm as it is rotated hoist the body up into the dumping position—and the angle of inclination is sufficient to slide 'most anything from coal to wet sand or cement out of the body in a hurry.

Mechanically, the dumping Alco and all the others have changed but little, as was made plain in Motor World's Before Shows issue. The new dry-plate clutch which has been adopted is an uncommonly neat piece of work and quite appropriately it is calculated to reduce work. Hardly any pressure at all is required to release the clutch. Incidentally, the clutch is completely housed to prevent the ingress of foreign matter, though the housing is quickly and easily removable, leaving the clutch as "get-atable' as any one could wish.



Making the Motor Dump the Load.

The Garford company, of course, makes a variety of power dumping trucks, included among which there is one that rises straight up on its hind legs, so to speak, and discharges its load through a chute at the side. However, the one that is exhibited is of the more orthodox end-tipping type that is hauled into position by heavy chains from the motor. Changes in the construction of Garford trucks also are scarce, though the vehicles themselves are none the less interesting. In one of the three-ton models, for instance, there is a novel method of mounting the oil side lamps behind the dash, permitting only the fresnal glass lenses to show through, thus giving the idea that electric lights are used. As a matter of fact, electric lights, set in flush with the dash, really are used in another of the three-ton models; a storage battery feeds them.



Another of the battery of dumping trucks that is interesting is the White. In this truck, too, the body is tipped up endwise by means of heavy chains, the unusual feature of the arrangement being in the method of drive, which permits the body to be raised or lowered at four speeds; which means, of course, that the tipping mechanism is "aft" the gearset and operates through it. Despite this fact, however, the body may be raised to any angle—45 degrees being the limit—and stopped, when the tipping mechanism may be disengaged and the vehicle moved backward or forward until the gasolene gives out without affecting the angle of inclination.

There are other things, too, at the White exhibit which serve to draw crowds. There is an uncommonly "classy" white ambulance, for instance, that is complete even to a wash basin and appears so "comfy" inside as almost to invite sickness or accident. Also, there is a six-cylinder combined chemical and fire hose wagon which bears the distinction of being one of the two six-cylinder vehicles in the show. The reason for the six-cylinder motor, it is explained, is to permit real speed, and to further its accomplishment the vehicle is fitted with the regulation White electric lighting and engine starting system. There is a great high tower wagon, too, that is one of many delivered to street railway companies for the relief of broken wires and the rejuvenation of "dead" arc lamps.

The G M C line, produced by the General Motors Truck Co., also includes a well-thought-out example of the species dumping truck, the dumping mechanism being operated by the engine through an auxiliary shaft with its own gears, which drives a second shaft mounting a drum on which the chain is wound. The rest of the line, by the way, is distinctive by reason of the first appearance of two new models in which the motor is placed forward under a hood, in contradistinction to the older vehicles, in which the motor is placed beneath the floorboards. The two models are a 3½-ton truck and a 5-ton truck, though except for the change in the location of the motor they are almost exactly like the others. In the smaller models—namely, the 1¼-ton and 2-ton vehicles—a cone clutch with the familiar adjustable face is employed, and instead of four forward speeds there now are only three.

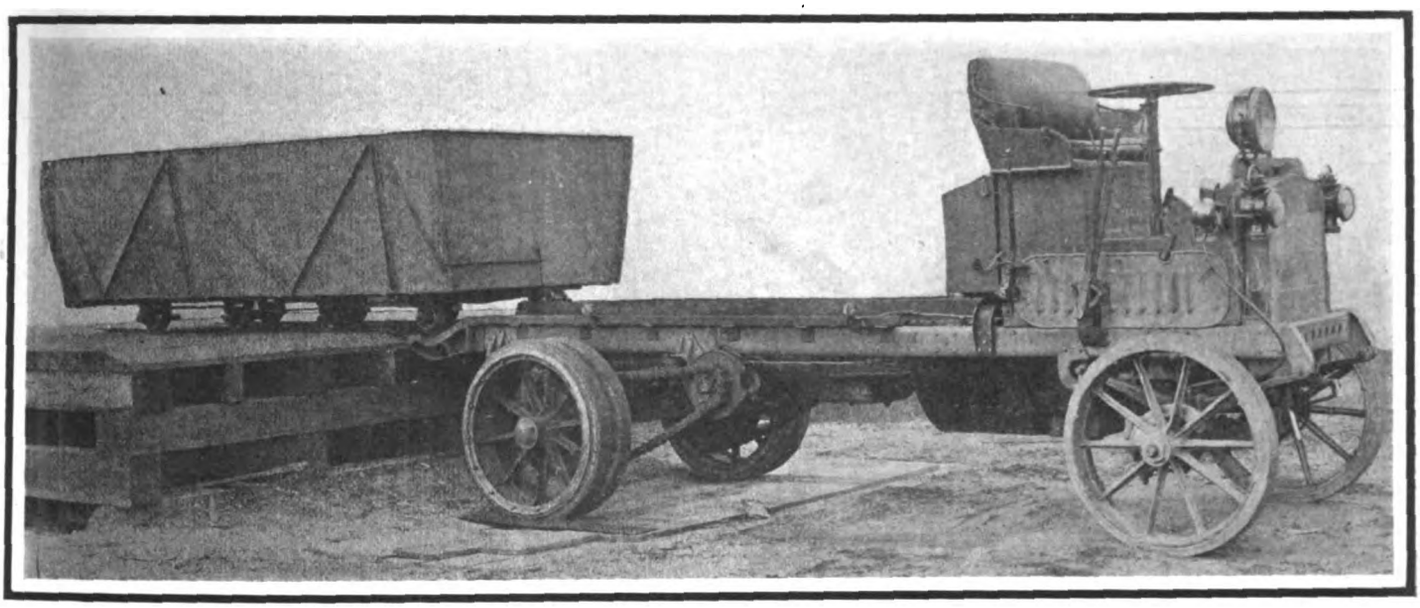
GARFROD TRACTOR AND DUMPING TRAILER—CAPACITY 12 TONS

ALCO DEMOUNTABLE BODY, SHOWING USE OF "DEAD" WAGON

Digitized by Google

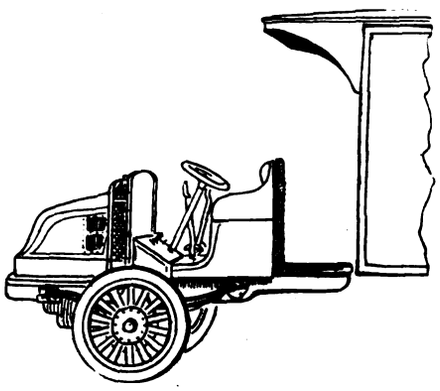
Among the three or four hand-dumped trucks exhibited, the Speedwell is an example of the simplicity which can be obtained in such construction, and as an indication of the efficacy of the method it is pointed out that a full load can be dumped and the body returned to position in the short space of time of a minute and one-half. In operation, a lever first is placed on one shaft a few turns of which suffices to raise the body about an inch, after which the lever is changed to another shaft and a dozen turns or so slides the body backward until it teeters and finally dumps itself.

Speedwell trucks always have been distinctive by reason of the location of their motors under a side-tipping combined driver's seat and cab, though now they have been rendered even more distinctive by reason of the improvements that have been worked out. The motor suspension, for instance, is brand new; whereas it was rigid before, it now is flexible, the power plant being mounted on a sub-frame which pivots at the rear end and is carried on double coil springs at front, permitting a degree of combined flexibility and rigidity that seldom is excelled. Also, there is a new style jackshaft anchorage with a separate mounting for the radius rods, and the brakes have been placed at the ends of the jackshaft; all the models now are equipped with governors and all of them have new carburetters in which the air is heated; the frames have been braced and strengthened and a new wood bumper continuous with the frame has been added.



Details of Dumping Mechanism.

Getting away from conventional practice in the design of power dumping bodies, the Locomobile company has killed two birds with one stone, so to speak, by providing a brand new type of body which is not only dumped by the power of the engine but which is demountable—also by the power of the engine—as well. The whole exhibit, consisting of but two vehicles, is a more than ordinarily interesting one that never fails to attract a big crowd that hangs over polished brass rails and just naturally gapes as a big five-ton truck alternately rolls backward and forward, dumps its body and "demounts" it on an elevated platform at the rear.

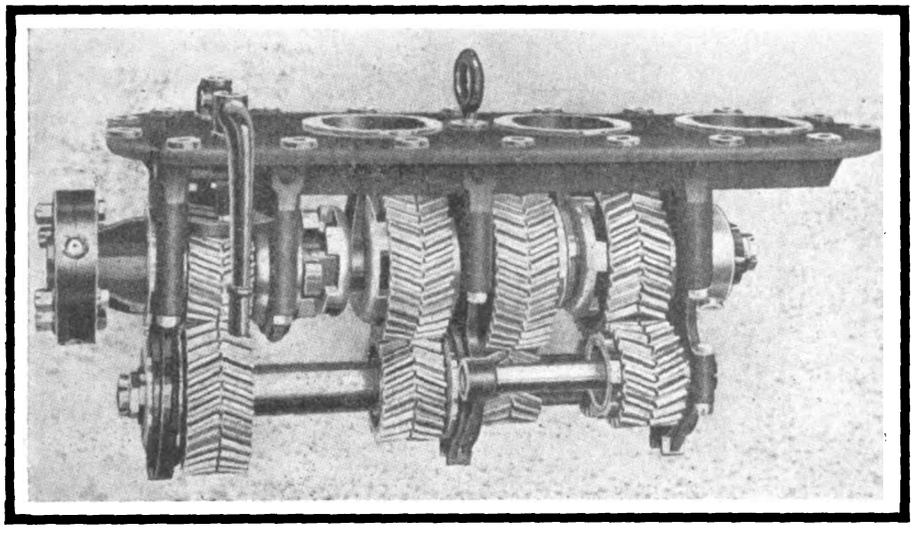


The operation of the whole mechanism is beautifully simple. A single screw the length of the chassis is mounted longitudinally and driven by gearing from the engine. The screw carries an arm attached at one end to the center of the movable body, which slides on metal ways provided with lips at the rear extremities. If the body is merely to be dumped, the screw is set in operation, thus moving the body backward until its rollers drop into the lips at the end of the chassis frame, when the action of the arm pushes the fore part of the body up, dumping out the load. When the body is to be dismounted, the truck is backed up to a loading platform of the proper height and the screw put in operation. As the body is pushed backward it naturally comes to rest on the loading platform and its running wheels do not drop into the lips in the metal ways. The body is pushed steadily backward until it is entirely free of the truck chassis, which then may be moved away to receive another loaded or unloaded body, as the case may be, the power of the engine being used to place the second body on the chassis.

The other Locomobile combination, which scarcely is less interesting, has been designed primarily for the handling of lumber in the most expeditious manner possible. It consists essentially of a Locomobile chassis—all of them are of five tons capacity, by the way—and an extra "dead" wagon. On the chassis is mounted a special body and by means of the same type of gearing as is used in the dumping truck, except that it is hand operated, the body may be slid off the chassis on to the "dead" wagon, the operation requiring but a few moments. Incidentally, by sliding the movable body backward until it projects several feet beyond the end of the chassis, it is possible to transport lumber in longer lengths than can be transported ordinarily.

Except for the addition of these two new body styles, the Locomobile chassis, which made its initial appearance at the last show, has undergone no changes in the interim, though a number of minor improvements have been made. One of them, which is calculated to encourage the stopping of the engine during the time the truck is loading or unloading, is the location of the ignition switch at the side of the dash-

LOCOMOBILE COMBINED DUMPING AND DEMOUNTABLE BODY TRUCK, SHOWING METHOD OF DISMOUNTING BODY



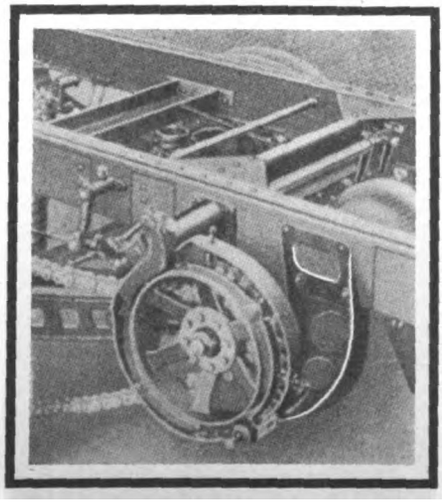
LATIL FRONT WHEEL DRIVE

Digitized by Google

board, where it may be reached conveniently when the truck is idle. The switch is enclosed in a neat aluminum housing to make it waterproof, and only the handle protrudes.

Alco "Dead" Wagon Construction.

Another interesting type of demountable body built along somewhat the same lines as the Locomobile, is the Alco. It differs from the former, however, in several respects. The body portion is mounted on wheels which run in metal ways and the "dead" wagon also is equipped with the same type of metal ways as are used on the truck. The modus operandi is to back the "dead" wagon up to the truck, when two small "gangways" may be let down and the loaded or empty truck body can be run off, permitting the use of the chassis for other purposes. In the Locomobile "dead" wagon the designers have obviated the necessity for obtaining perfect alignment between the truck chassis and the "dead" wagon by providing a swiveling arrangement on the latter which permits of the load being transferred, even though considerable discrepancy in alignment obtains.

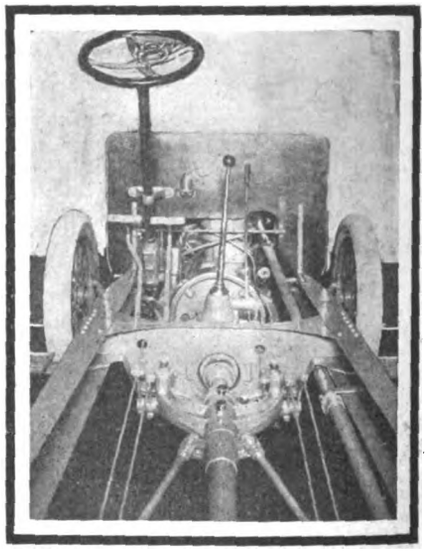


SMITH-MILWAUKEE GEARSET SHOWING WIDE-FACE HERRINGBONE GEARS

Use of Martin Tractor Illustrated.

At the Knox stand, the Martin tractor is exhibited for the first time in connection with a proper trailer. To those who have moderately long memories, it will not be difficult to recall the first appearance of the Martin tractor at the last show, when it was perched atop a heavy Knox chassis, where, though an excellent idea of its construction could be obtained, it was difficult to judge of its actual utility. As it is exhibited at present, however, properly "hitched" in one case to an open stake trailer and in another to a closed body similar to one already purchased for the collection of garbage in New York City, its possibilities loom large. For the edification of those who are unfamiliar with its construction, suffice it to say that it is a three-wheeled vehicle—the only "three-wheeler" in the show, by the way—in which the motor is carried forward under a hood and behind a radiator, the single front wheel being small and the rear wheels being large and shod with dual rubber tires.

Although no changes in construction are apparent in the Martin tractor, the other Knox vehicles exhibit several important alterations calculated to increase their efficiency and to render smoother their action. Thus, for instance, the main driving gears in the gearset now are spiral instead of spur; all of the chassis have new long-stroke motors and metal covered universal joints now are common to all; jackshafts and tires have been made slightly heavier, and another smaller change pertains to the cooling fans, which now have three blades instead of two blades.



POPE-HARTFORD BRAKES

The only other tractor in the show is the Garford, which naturally is of the four-wheel type; nominally, the chassis is the same as that used for the standard five-ton truck, though it is considerably foreshortened. Incidentally, the foreshortening brings to light another advantage of the tractor and trailer apparent in the extremely short turning radius which is possible. This Garford tractor and trailer, it is pointed out, is capable of transporting 12 tons with practically none of the load weight carried by the rubber tires of the tractor.

Truck of Tractor Characteristics.

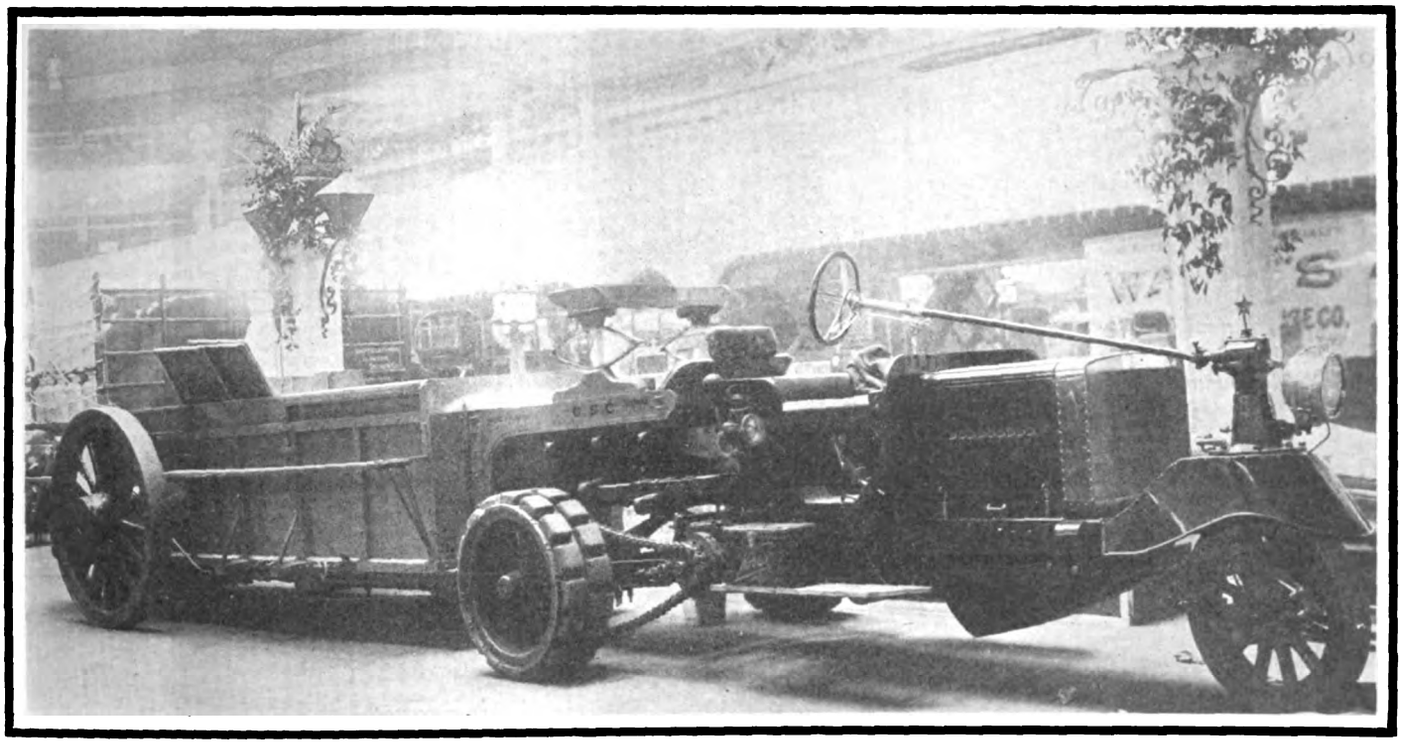
Although it is not a tractor, strictly speaking, the Walter Latil drive truck still partakes of some of the features of one, for the reason that the power unit virtually is separate from the load carrying unit and supports but a small proportion of the load. The other trucks at the Walter stand are distinctive by reason of the use of the Westinghouse individual clutch transmission, though its use is not new and has been featured by Walter products ever since their appearance, some time ago; this is the first time they have appeared at a public exhibition, however, and a critical examination of their construction reveals little or nothing that is not orthodox in pattern. One of the chassis exhibited, it is true, is equipped with the new Westinghouse air springs, though it is explained that they are not standard equipment and are attached to the chassis as much to test them out as to exhibit them to the gaze of the public. Apparently, only one material change has been made—the service brake has been placed on the jackshaft inside the chassis frame and is very nearly completely enclosed by means of a metallic housing.

BUICK TORQUE TUBE ASSEMBLY

Among the trucks that make their initial appearance at any show—the list including Willys, Utility, Hupmobile, Selden, a new model Reo, a new five-ton Pope-Hartford, a new light Kissel, and the rejuvenated Kelly-Springfield line—none is a real surprise nor contains anything of a really surprising nature, though in all of

Digitized by Google

them there are individualities which preclude the possibility of generalizing.



Many Machines for Light Loads.

The Reo, for instance, is the first four-cylinder Reo truck to put in an appearance, and is interesting for this reason, if for no other. There are several fine points in its design, however, which will bear close scrutiny, and among them the employment of a detachable tube radiator is a feature that should be appreciated by owners whose drivers are wont to act carelessly. Another feature which is calculated to suppress that brand of carelessness evident in fast driving, is the governor. It is a hydraulic device of the vehicle within the prescribed limit without affecting engine speed, thus permitting the use of any speed in the gearset for heavy pulling. It is a centrifugal device operated from one of the front wheels by means of a set of gears and a flexible shaft similar to that used in driving speedometers.

The Selden is another light truck that has been on the market for some little time, though it has not previously been publicly exhibited, and, like the others, its construction is perfectly rational and standard, though it incorporates a number of features that are all its own. The jackshaft, for instance, is mounted on the chassis frame in ball and socket joints, permitting slight it has been designed to provide a more than ordinarily wide margin of safety; as an example, it is rated at 1,500 pounds capacity, though it is pointed out that the safe maximum load may be 500 pounds more.

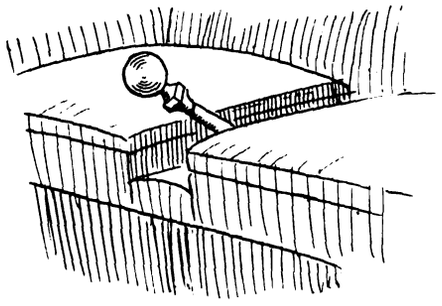
Some of the Detail Refinements.

By way of providing plenty of power, a four-cylinder vertical water-cooled motor with cylinders measuring 4 x 4½ is used; the rating is 30 horsepower. Power is transmitted to a jackshaft through the intermediary of a cone clutch and selective gearset, and thence to the rear wheels by means of side chains. Conforming to the general practice, the steering wheel is lo-

MARTIN TRACTOR ATTACHED TO GARBAGE COLLECTION WAGON WHICH FORMS PART OF KNOX EXHIBIT IN GARDEN

mounted directly on the intake manifold and operated by the pressure of the water in the cooling system. Appreciating that the comfort of the driver may have a decided effect on the efficiency of the vehicle, the designer has placed the gearshift lever between the front seats, where it is at once out of the way and perfectly accessible.

The Hupmobile delivery wagon that makes its first appearance at a show, though it has been in existence plenty long enough to make a reputation for itself, is essentially the pleasure car chassis, in which a few modifications have been made with a view to generally strengthening the structure. Though there can be no doubt that in its revised form it really is a commercial vehicle, the addition of a governor removes even the last suspicion of doubt. The governor is adjustable for any speed, and is unique in that it operates to hold the speed frame weaving without the danger of damage resulting; another interesting point is the manner in which the radius rods are attached to the chassis, also through spherical joints.

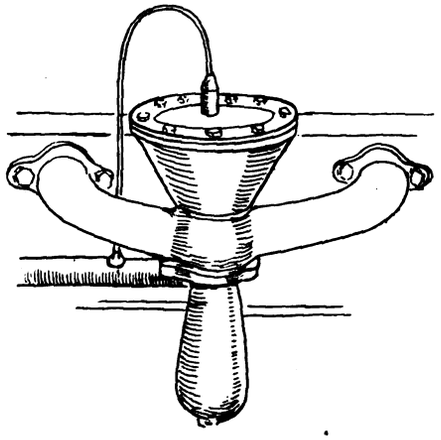


Surprise That Was Anticipated.

Exhibited side by side with the other and larger products of the Gramm Motor Truck Co., the Willys Utility wagon forms a sort of a mild surprise, for though it was known to be in active process of development, only its appearance made known that it is ready for the market. Though in its material aspects it appears slightly like a modified pleasure car chassis, if viewed from afar, closer inspection reveals that there really is scarcely one little thing about the truck which suggests pleasure car practice—that it is a real commercial vehicle designed primarily for goods transportation, and that cated at the left side with the control levers in the center of the footboard.

As for the other Gramm products, they are quite similar to their immediate predecessors, except that they are all fitted with governors. As is but natural, they have several individual characteristics, among which the accelerator, its position and its method of operation are enlightening as indicating a trend toward greater safety. Instead of operating by downward pressure, the accelerator swings sideways, so that no amount of instinctive bracing on the part of the driver in the face of impending trouble can precipitate an accident. Another point about the chassis which is interesting is the method of mounting the springs on rollers in slots carried by the chassis frame. In this way, the usual spring shackle is eliminated without impairing the latitude of movement of the springs.

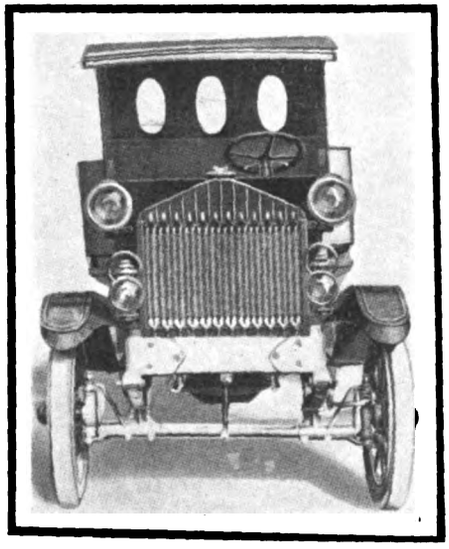
Digitized by Google



Although the Kissel 2,500-pound truck which is exhibited for the first time is new throughout and represents the most recent addition to the already extensive Kissel line, there is nothing in its make-up that is really radical in design. In the fewest possible words, it is a standard product. Its most distinctive feature is its low-hung appearance and the use of a radiator the top and sides of which are finned to facilitate the

REO GEAR SHIFT LEVER

dissipation of heat. Incidentally, the radiator is supported on springs, as is the whole plant, the latter being mounted in a subframe on the main frame. The motor is rated at 36 horsepower and measures 4¼ x 5¼ inches bore and stroke, respectively. By way of discouraging speeding while at the same time leaving the motor free for hard pulls on low gear, a governor limiting the speed of the vehicle but not the speed of the motor is employed.

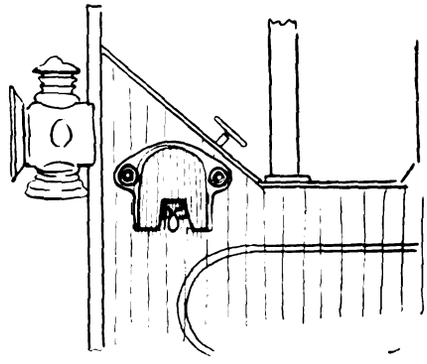


The most conspicuous feature of the new

REO HYDRAULIC GOVERNOR

five-ton Pope-Hartford truck that since last show has been added to round out the line is the brake mechanism, which almost truthfully is colossal; not inappropriately the new brakes are styled "locomotive" brakes; they are common to both the three- and the five-ton chassis, their incorporation in the former being about the only change that has been made, barring, of course, the adoption of a larger motor. Another new feature of both chassis is the manner of mounting the driver's seat and cab; in the new construction, the whole cab may be tipped backward, completely exposing the power plant without the necessity for disturbing even the control elements. One of the features of the five-ton chassis which scarcely can be overlooked, is the exceptionally liberal tire equipment—rear tires measure 42 x 6 and are dual and front tires measure 38 x 7, single.

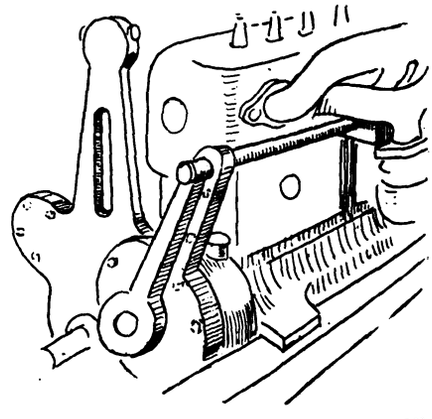
The Kelly-Springfield line is not new, of course, though to a casual observer it might well appear to be new, what with the slanting hoods and Renault type radiators that have come with the adoption of water-cooled motors in place of the air-cooled engines that served for so long to distinguish the line. The new motors, by the way, are exceptionally accessible, just one instance of the elimination of complexity being the mounting of the magneto and the water pump up front on a transverse shaft; the



REO DETACHABLE TUBE RADIATOR

oil filler cap also is up front, where it is instantly accessible, and the breather pipe is located between the two pairs of cylinders, where it is out of the way.

By way of housing the fan, which is placed behind the radiator, in contradistinction to the usual construction in which the Renault type of radiator is used, a dome-shaped metal casing serves also as part of the footboard. The fan belt adjustment is more than ordinarily simple, the fan being mounted on a transverse arm which serves also to provide a measure of protection for the radiator. One end of the arm is slotted and held in place by a large nut, which, when loosened, permits the arm to be moved a few inches in order to tighten the belt. Another clever adjustment is to be found in the radius rods, which are provided with means for taking up the slack in the driving chains.



Among the older cars that make their appearance perennially with scarcely any change to distinguish them from their forbears, there are the Autocar, the Velie and the Federal, the first and the last being made in but one capacity each. As usual, the Autocar exhibit is one of the most complete in the show, and quite as much as usual it requires a very high-powered magnifying glass to discover any material alteration in construction One very important change has been made, however, though it is a change in price and not in design—

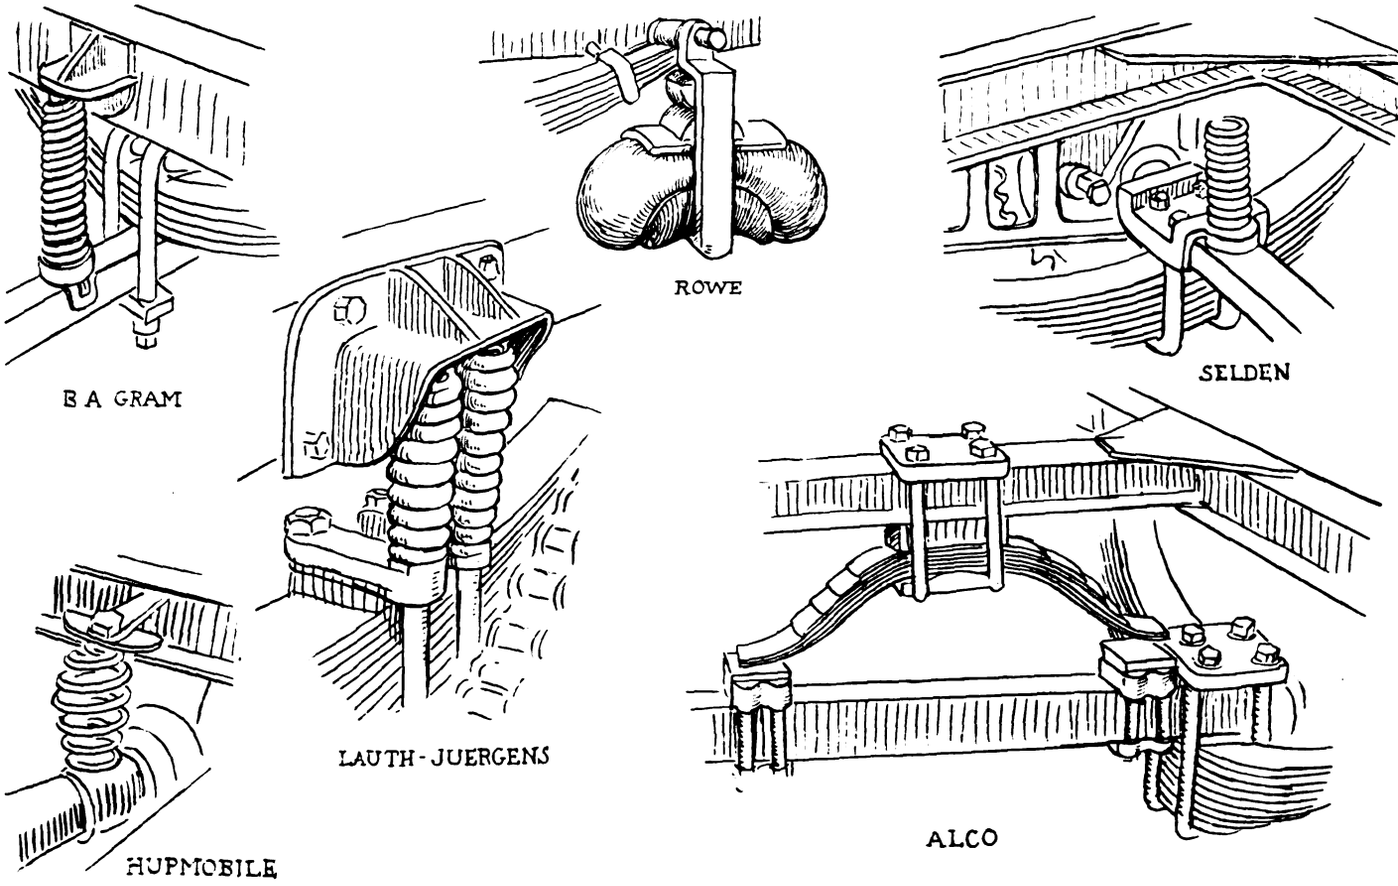
LOCOMOBILE SWITCH POSITION

hereafter the chassis will list at $2,000 instead of $2,150.

As for the Federal, there is even less change apparent in its construction, though it goes without saying that a number of improvements not visible to the naked eye, though nevertheless increasing efficiency, have been made. One point that is peculiar to the Federal is that the steering column is absolutely devoid of all devices; there is no spark control lever, for the good and sufficient reason that set spark ignition

STERNBERG GOVERNOR CONNECTION

is employed and the throttle is controlled by a pedal.



Representative of the Velie line, which is more complete than the exhibit presupposes, there is a three-ton chassis, a one-ton chassis and a two-ton vehicle complete, and in none of them is there apparent any material deviation from previous practice. Chiefly conspicuous is the method of hanging the springs outside the chassis frame instead of beneath it, as is the common practice; this construction, it is pointed out, permits of a lower center of gravity. Another feature which is most conspicuous

Digitized by Google

of course, is the method of equipping the radius rods with heavy spiral springs by way of lessening the road and driving shocks ordinarily transmitted to the chassis.

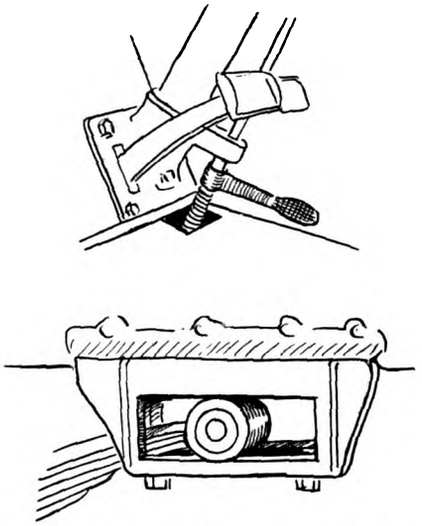
Final drive through live axle and gears, the weight of the car being carried by a separate "dead" axle, is the "tie that binds" another group together. Four makes of this drive are shown, one being the new Studebaker gasolene truck, another the Latil front drive machine, a third the big Mais, which has done much to make this drive familiar in the United States, and the fourth the Brown, an extremely neat machine and which cannot be classified, for the reason that the mechanism inside the casing is regarded by its inventor as a deep, dark secret—notwithstanding the fact that patents have been applied for, that trucks fitted with the governors are for sale and that anyone who wants to know very badly can buy or borrow a machine and take down the casing!

One of the bright little ideas of the show is the color scheme of the new Stewart chassis. At the first glance it might appear that the makers tried to see how many different kinds of paint they could get on

VARIETY DISCLOSED BY A COMPARISON OF AUXILIARY SPRING MOUNTINGS

the smallest car shown embodying the principle in question Manufacturers of this driving system lay great stress upon the remarkable results that have been obtained from internal gear drive in the service of the United States army and the favor with which it is regarded by military engineers.

While there has been an increase in the number of cars fitted with governors for preventing the attainment of excessive speeds, there appears to be considerable doubt as to the utility of the device, even on the part of some of those who fit it to their cars. Nevertheless—the governor is gaining ground, and there is good reason for it. Most of the governors are of the centrifugal type, the exceptions being one or two hydraulic devices and at least one one chassis; but a little investigation develops the fact that all the members of each system are colored alike in order to facilitate the following out of connections and functions. For instance, the foot brakes and all connections are blue and the hand-braking parts red; the transmission system, orange; the steering system, light brown; cooling system, yellow, and so on, throughout the chassis. While this is intended as a show "stunt," designed to enable visitors to understand more readily the construction of the chassis, the idea seems too good to be ignored after the shows are over.

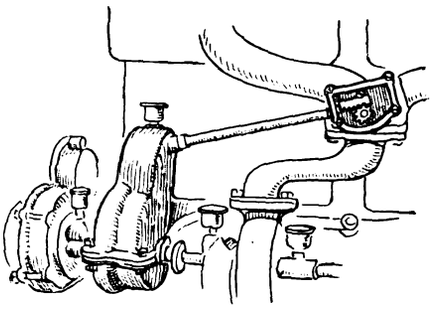


Not a few commercial vehicle makers are experiencing the delights of a truck show—or, at least, of a national function—for the first time, so far as their present exhibits are concerned. Some of the machines are quite well known through published descriptions and through cars in actual service—B. A. Gramm, Stewart, and Latil, for example—while the Croce and Maccarr need an introduction—and are getting it, if the interest of show-goers counts for anything.

A feature of the B. A. Gramm truck, and one that stands out like a good deed in an evil world, to revert to the vernacular, is the equipment of all models with the Gray & Davis starting and lighting system. While many makers—most of them, in fact —are waiting for someone else to "start something," the B. A. Gramm people have taken the leap and are confident that the starter is the right thing not only for the user but for the maker—in one case as an economy and a convenience and in the other as a getter of business.

The two models of the B. A. Gramm, of 2 tons and 3½ tons capacity, respectively, are practically alike except in dimensions. The same motor is used in both, with pair-cast cylinders of 4½ x 5½ inches bore and stroke. Both have dry plate multiple disk clutches and gearsets of the individual dog clutch type, the gears being always in mesh but not running when the direct drive is engaged; the smaller car has three speeds and the larger four. Motor and gearsets are sep-

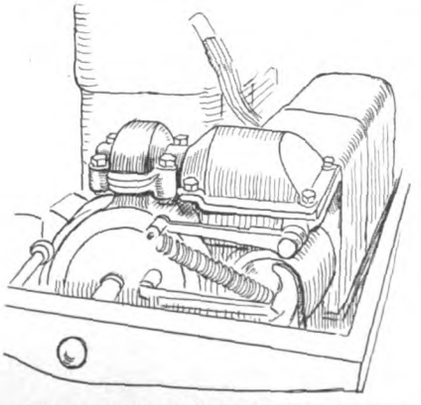
Digitized by Google



arate units; the jackshaft is of the full floating type and final drive is by side chains. A fine point in the motor suspension is that the sub-frame, to which the power plant is bolted, is carried on springs at each of the four supporting points, thus very effectually protecting the mechanism from the effects of the usual pounding. The driver's seat and the floorboards are placed directly over the motor; but they are lowered so that the top of the engine rises through the floor, which is provided with a shallow hood as a protection. Incidentally, this brings up the fact that there is a decided tendency toward this form of construction, there being five machines showing this arrangement. There are many points in its favor; the maximum loading space, with a given wheelbase length, is available without hoist-

GRAMM PEDALS AND SPRING MOUNT

ing the driver's seat high in the air; the motor is accessible both from the sides and from the top; the arrangement is compact and convenient and, last but not least, even if it is rather a negative virtue, there is apparently little of importance that can be said against it. The big La France hydraulic truck, with the Manly drive, is built with the motor sharing the floor with the driver; so are the Hewitt, the Garford, the Blair and the new Croce. Not that the idea is anything at all new; it has been used for years, notably by the Hewitt; but there seems to be an increasing appreciation of its advantages. Doubtless the fact that the once popular amusement of "crawling all over" a motor has gone into the discard has something to do with it.

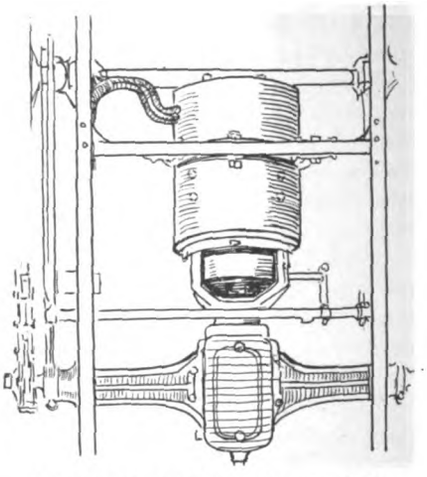


The Croce, which hails from Asbury Park, N. J., where it is built by the Croce Auto Co., Inc., has had local existence for two years, but is making its first real bow to the public. It is built in sizes from a 1,500-pound delivery wagon to a 5-ton truck. One of the first details of the Croce car to attract attention is the radiator, which is of the same construction throughout the line and consists of a large number of horizontal copper tubes expanded into front and back tube-sheets; the sides and top are riveted to the tube sheets and the whole riveted to and supported by a cast bronze base of great strenth. All joints are soldered more to ensure against leakage than anything else, though, of course, this process adds a certain amount of stiffness. All the Croce machines have four-cylinder mo-

SANFORD GOVERNOR POSITION

tors. In the smaller models the motor is under the floor, the hood coming up into the driver's space, and drive is through shaft and bevel gears. In the heavier cars the motors are in the usual front position and drive is by side chains.

Built throughout to standard specifications and embodying nothing that is at all radical, the chassis shown by the Maccarr Co. of Allentown, Pa., is a business-like "job." Two capacities are built — 1,500 pounds and 1 ton; the smaller car has shaft drive and the larger chain. In both cases



KREBS GOVERNING MECHANISM

the same unit power plant is installed; the motor has four block-cast cylinders of 3¾ x 5½ inches bore and stroke with an A. L. A. M. rating of 28 horsepower, and drive is through a dry-plate multiple disk clutch and three-speed selectively controlled gearset. Pneumatic tires are regular equipment on the smaller and solids on the larger model; all wheels are 36 inches in diameter front and rear; 4½-inch pneumatics are used on the smaller car and 3-inch solids in front and 4-inch in the rear of the 1-ton car. Speed is under the control of a governor and the steering wheel is placed on the left side of the machine.

Apart from its unique "color scheme," the new Stewart chassis of 1,500 pounds carrying capacity has many features that are of no little interest, stress being laid upon accessibility, simplicity and foolproofness. Briefly, the car, which already has been described in Motor World and has been in actual service for some months, is of the type in which the motor, under a sloping hood in front, is backed by the radiator; drive is through a multiple disk dry clutch, enclosed in the same housing with the three-speed selectively controlled gearset, forming a unit separate from the power plant and connected to it by a short shaft which is equipped with a double universal joint. Final drive is by bevel gears to the rear axle, which is of the full-floating type.

Not only does the position of the engine

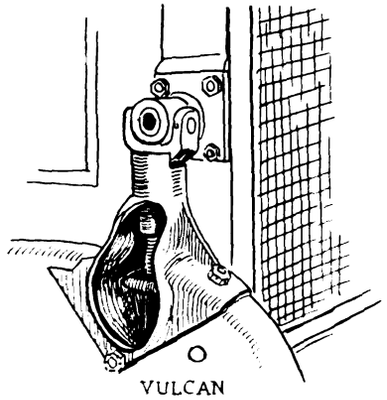
LANSDEN MOTOR SUSPENSION

permit its easy inspection from the front, the hood swinging upward and backward, but by removing the front member of the frame the timing gear casing can be taken off and, carrying the process a little further, the whole motor can be slid out with little difficulty.

Every unit in the car—power plant, gearset and clutch, steering system, rear axle system, and so on—is so arranged that it can be removed intact without in any way affecting other units. The motor is of the long stroke type, with block cast cylinders, and is conservatively rated at 30 horsepower; cooling is by forced circulation, and the usual radiator fan is replaced by a set of fan-blades projecting from the rim of the flywheel. Lubrication has been very closely studied, and there is not a frictional surface that is not provided with lubricating means, and not an oil-hole that is not fitted either with an oil-cup or a grease-cup.

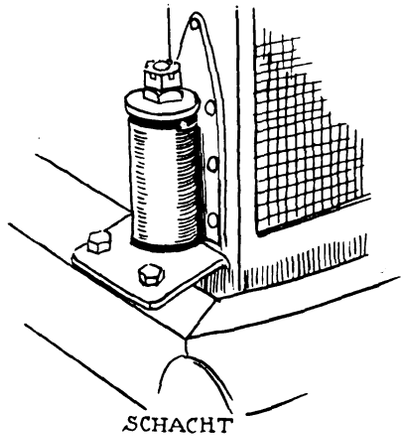
An interesting example of the increasing tendency to employ the tractor principle —that is, to pull the load behind the power

Digitized by Google



rather than push it ahead of the power—is found in the Latil front drive system, a French design, the American rights for which have been secured by the Walter Motor Truck Co., of New York, which company is exhibiting the machine at the Garden. Briefly, the Latil consists of a pair of rubber-tired artillery wheels carrying a four-cylinder motor which drives the wheels upon which it is mounted through a cone clutch, four-speed gearset, universally jointed shafts and spur pinions meshing with gears bolted to the wheels. The motor of the machine shown, which is rated as having a capacity of 2½ tons, is of 3⅜ x 5½ inches bore and stroke and has its cylinders cast in a single block. By means of suitable brackets and frames it is possible to adapt the machine to almost any body, which preferably is equipped with steel-tired wheels, thus saving the expense of a pair of tires subjected to the weight of the load. It has been found that the front drive system is particularly effective in pulling through deep snow, mud or sand, that skidding is very greatly reduced and that steering is rendered particularly easy by the application of power to the steering wheels—a fact that some are inclined to doubt, but which is a fact, nevertheless.

In the Heavyweight Class.



Among the distinctly big trucks of the show, and distinguished also by its unfamiliarity to show-goers—the current show marks its first appearance—is the Vulcan 7-tonner, the manufacturers of which, the Driggs-Seabury Ordnance Corp., of Sharon, Pa., are well known as manufacturers of truck parts but never before have shown a complete car. While the 7-ton machine is the largest of the line, which includes six models, the smallest having a capacity of three tons, the constructional features are practically alike throughout. Generally speaking, the machine is of standard type, with motor in front under a hood, cone clutch, three-speed gearset in the four smaller sizes and four-speed in the 6- and 7-ton, and final drive through side chains. There are, however, many details that are worked out with unusual care, and show a keen appreciation of the difficulties that must be overcome by trucks doing really heavy work. While the frame has been made exceedingly strong and substantial, care has been taken to avoid excessive rigidity; yet all parts that require accurate alignment are immovably held in line. On the other hand, the crankshaft, to cite a conspicuous example, is constructed with the rear journal exceedingly large—much larger than the other bearing sections—and the rearmost cheek is correspondingly strong. This is done because the rear end of the crankshaft has to transmit all the power developed by all four cylinders. The correctness of the principle involved is borne out by the statement that not a single crankshaft of the Vulcan type has been broken.

Small Things of Great Importance.

A very neat radiator suspension has been worked out, consisting of a pair of short, hollow sockets containing coiled springs which carry plungers pivoted to brackets bolted to the radiator. The spring sockets are mounted on the frames and the brackets on the radiator are placed near the bottom. The spring movement is sufficient to take

VULCAN

SCHACHT

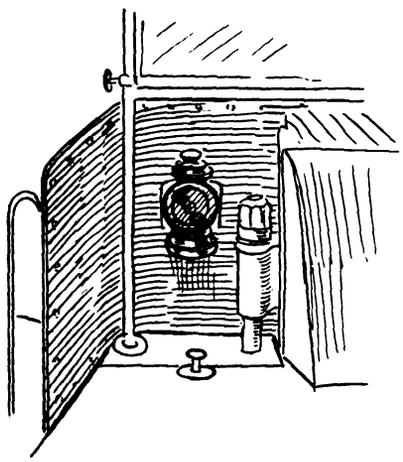
RADIATOR MOUNTING STUDIES

care of all road shocks, and is effective in both directions. Another detail, which is a solution of a problem that has bothered more than one truck builder, is a differential lock that permits the driving wheels to be driven together for pulling out of bad places, but which will automatically throw out of engagement if the truck is run on a curve—which means that the differential lock will lock the wheels only when such locking is unobjectionable. The gearset is of the constantly-meshed type, with solid dog clutches. In the gearcase is another of those features that abound in the machine. The cover is in two parts—or, rather, there are two covers, one small and the other large. The small cover, at the forward end, can be replaced by a special case carrying a gear which meshes with a special gear on the countershaft of the gearset, and a shaft, projecting from the superposed gearcase, carries a pinion for the transmission of power to hoisting mechanism, winches or anything else that it might be desirable to drive.

Worm Drive in a "Land Leviathan."

Another member of the "land leviathan" class is the six-ton Smith-Milwaukee, which is being shown for the first time in the East and is further distinguished by the fact that it is the biggest of the worm-driven contingent. The first impression of this machine is one of hugeness, due to the fact that the long gearcase and the extremely large rear axle housing are connected by a steel torque tube of large diameter and, further, the frame is of massive proportions, being no less than nine inches deep. Naturally, the most striking feature of the machine is the rear axle system, which, taken as a whole, is a triangular unit consisting of the axle casing, the torque tube and two radius rods of heavy construction which extend from the outer ends of the axle casing to the forward end of the torque tube, where they converge and are secured. This ensures rigidity and accurate alignment of the worm-driving system—a matter of no small importance. The motor, which is separate from the gearcase, drives through a very large universal joint. The various units are readily demountable separately, and, notwithstanding the size and massive proportions of the machine, it is a comparatively easy matter to take down or assemble one with few tools, even under conditions not altogether favorable.

The gearset, which provides three forward speeds, is of the individual dog clutch type, and the fact that the gears are constantly in mesh makes possible the peculiarity that the teeth are of the herringbone variety. That the gears are built for downright hard truck service is indicated by the fact that they have faces no less than three inches wide. Both main shaft and countershaft, which are located one above the other, are carried in bearings suspended from the top plate of the casing, as the bearings of a motor are carried on the upper part of the crankcase. The lower part of the casing is comparatively light and serves mainly as an oil reservoir and dirt excluder. The two models, 3½-ton and 6-ton, are as like as two peas, apart from general dimensions. The motor in the smaller is of 40-50 horsepower and in the larger of 50-60 horsepower. Both are of the T-head type, with pair-cast cylinders, and are located under hoods in front. Governors are fitted to limit maximum speed.

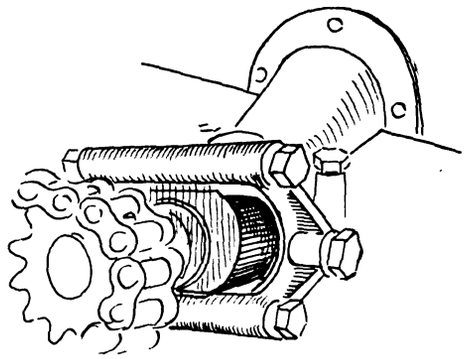


While the La France hydraulic truck is exhibited for the first time, its construction

Digitized by Google

and method of operation are so well known that description here is unnecessary. Suffice it to say that, though the machine is the most radical departure from standard practice at the show, it has been so well tried out that it cannot be regarded as either experimental or freakish in any way. The machine exhibited has its hydraulic transmission system driven by an electric motor, and the exceedingly simple single lever control shows to the best advantage. The least understood part of the transmission system—the mechanism for changing the stroke of the driving pumps—is shown separately, so that its seemingly intricate, but really simple, operation can be studied readily.

Universal Brings Out a Worm Drive.



One of the new models brought out by established concerns is the Universal Motor

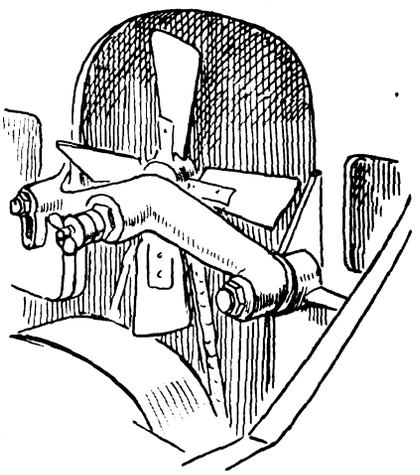
GARFORD LAMP MOUNTING

Truck Co.'s one-ton worm drive machine, which is an extremely business-like specimen of this very modern type of final drive. Drive from the gearcase to the worm is through a rather long propeller shaft with two universal joints; the rear axle is held in alignment and torque and driving stresses taken by heavy pressed steel channel-section rods running from the axle ends to the cross-member of the main frame. The motor, mounted as a unit with the gearcase, is of 30 horsepower, with block-cast cylinders and enclosed valves. The clutch is a dry single disk and the gearset gives three forward speeds with the usual selective control. While the machine abounds with interesting features, one example will serve to show the way in which the designers have gone at their work. The carburetter is supplied with hot air from a hood surrounding the exhaust pipe. Close to the carburetter, however, is a valve, operated by a little ratchet handle, which controls a large opening. This permits regulation of the temperature of the air going to the carburetter, for when the valve is wide open the amount of hot air drawn over the exhaust pipe is almost negligible, while when it is closed all the air taken in is heated.

Another worm-drive advocate is the Rowe Motor Mfg. Co., of Coatesville, Pa., which builds three worm-driven models, of 1, 1½ and 2 tons capacity, respectively. All three, however, are built alternately with side chain final drive, so that the purchaser can take his choice, the machines being exactly alike in other respects. The Rowe trucks have been standardized for some time; the changes made from year to year are only

KELLY CHAIN ADJUSTMENT

matters of detail that are suggested by experience.



Worm drive exclusively is employed by the Blair Mfg. Co., of Newark, O., in its three models of 1½, 2½ and 3½ tons capacity, respectively. The Blair power and transmission system is unusual in design in that it forms a separate multiple unit suspended within the main frame of the car. A narrow sub-frame extends clear from the rear axle housing to the front end of the car, carrying both gearset and motor and keeping them aligned at all times with the rear axle. The sub-frame is supported on three points, so that it is not possible to cause binding or disalignment of any of the parts that should be kept free; moreover, it is a simple matter to remove the entire driving system at once, or, for that matter, to take out any one of the separate units without disturbing any of the others. The Blair motor, which is of 4⅛ x 5¼ inches bore and stroke in the smaller car and 4½ x 5½ inches bore and stroke in the two larger, are under the control of sealed automatic governors.

Also Worm in Schacht Product.

The Schacht worm drive one-ton truck presents an example of simple, substantial construction, very much like other Schacht cars apart from the final drive. It embodies the latest ideas of the builders—large wheels, but nevertheless a low-hung body, which is permitted by the use of a special form of platform rear spring suspension. On the model in question, which is only one of a line of six ranging from 1,500 pounds to 4 tons, the wheels are 38 inches in diameter front and rear. The motor is of rather surprising power for the machine, being rated at 45-50 horsepower, and has block-cast cylinders of 4¼ inches bore and 5½ inches stroke. The gearset is separate from the motor unit. Westinghouse starting and lighting equipment is installed, when ordered, as an extra.

Two New Darts But Little Changed.

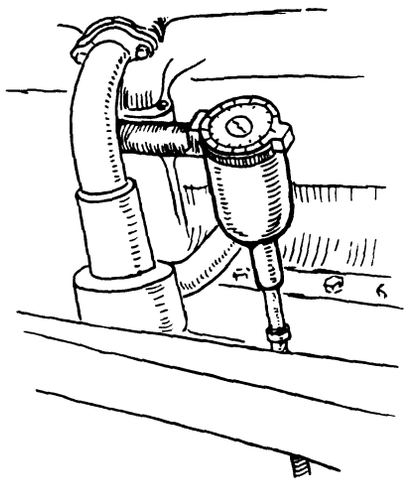
The Dart Mfg. Co., of Waterloo, Ia., whose little two-cylinder wagon has been a feature of other shows and still is "doing business," has brought out two new models, of 1,500 pounds and 3,000 pounds capacity, respectively, and which are of what may be termed conventional construction throughout. They are sturdy wagons, with four-cylinder motors, 25-30 horsepower in the smaller and 35-40 horsepower in the larger,

KELLY FAN ADJUSTMENT

driving through cone clutches, three-speed selectively controlled gearsets which are built as units with the jackshafts, and side chains to the rear wheels. No changes whatever have been made in the little car, its two-cylinder opposed motor and planetary transmission being "plenty good enough to let alone," in the words of the makers.

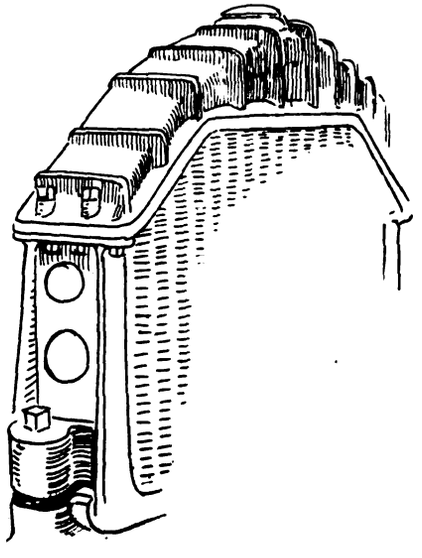
The most important change apparent in the exhibit of the Lauth-Juergens Motor Car Co., of Fremont, O., is the addition to the line of a 5-ton truck which, however, is built along exactly the same lines as the already well-known 1-, 2- and 3-ton machines. One of the interesting features of the new machine is that the bearing housings are so constructed as to be capable of taking either roller or ball bearings, so that either can be fitted at the option of the purchaser. A special Lauth-Juergens feature is the gearset, which is provided with three speeds in the two smaller models and four speeds in the two larger, including, of course, the new 5-tonner. Direct drive is on third speed in all cases; where there

Digitized by Google



are four speeds the fourth is an overstep. The whole gearset is substantial in the extreme, and it is the particular pride of the makers. The clutch is a very simple disk affair, there being a single disk which is pressed between two driving disks when the clutch is "in." Protection for the driver always has been a Lauth-Juergens feature, and standard construction still includes a completely enclosed cab, which can be tilted bodily, with seat and floorboards, to give access to the motor in extreme cases, though for all ordinary work there is ample accessibility through the side openings.

Light Wagons of Orthodox Pattern.



A new model has been added to the line of Krebs cars—a 1½-ton machine with a four-cylinder four-cycle motor. The designation "four-cycle" is necessary in this instance, because both the other Krebs machines—1,500 pounds and 1-ton capacity—have two-cycle motors with two vertical cylinders. Like the other models, the new machine has cone clutch and three-speed selectively controlled gearset; final drive is through side chains, like the 1-ton model; the smallest car has shaft drive. Left side steering is employed. A new form of governor is used, the details of which are not available, but which evidently is of the centrifugal type; the governor acts on the throttle and the ignition simultaneously and maintains a constant motor speed under all conditions. The governor is applied to all models, though in slightly different form in the new machine from that used in the older models. Provision is made for the installation of an electric starting and lighting system which, however, is supplied only on special order and at an extar cost over the list price.

If there is any virtue in a long name there ought to be something in the "Best" and the "Flint" machines, built by the Flint Motor Wagon Department of the Durant-Dort Carriage Co., of Flint, Mich. The little "Best" wagon of 1,000 pounds capacity with two-cylinder opposed motor and two-disk friction drive, is no new thing; the changes in its construction are almost negligible. The "Flint" cars, however, are new models, with a normal load capacity of 1,600 pounds. There are no radical features; the design is of the standard type, with four-cylinder, 22-horsepower motor, cone clutch, three-speed selective gearset in a separate unit and bevel gear final drive, the rear axle being of the full floating type. It may be remarked, however, that the frame is particularly well braced in the rear, and that the triangular torque system is very neatly worked out, the two rods from the axle casing ends coming together just back of the forward universal joint of the propeller shaft and the whole triangle being stiffened by a cross brace which extends from one rod to the other and is secured to the forward end of the bevel gear casing. With a wheelbase of 106 inches the Flint wagon has a loading space 82 inches long and 45 inches wide.

While the new Brown, built by the Brown Commercial Car Co., of Peru, Ind., is the smallest of the machines having final drive through gears direct to the wheels, it is none the less a machine of extremely attractive design. The rear axle is held in position by the popular triangular arrangement of torque rods, the rods being considerably longer than is usual, however, in addition to being of ample strength. But a single model is built, having a carrying capacity of 1,500 pounds; the motor, with block-cast cylinders of 3¾ inches bore and 5¼ inches stroke, is mounted as a unit with the three-speed gearset controlled by centrally located levers. Left side steering is adopted. Incidentally, the frame of the little Brown is unusually substantial for a car of its size.

HUPMOBILE ADJUSTABLE GOVERNOR

KISSEL "FINNED" RADIATORS

The Mais, the big, husky father of American internal-gear driven trucks, is entirely unchanged.

Standardization of Electrics.

All the electric cars are under one roof—that of the Grand Central Palace. Taken as a class the whole eight of them—Atlantic, Baker, General Vehicle, G. M. C., Lansden, Studebaker, Ward and Waverley—stand for stability in design and construction to a remarkable degree. As already has been noted, the Studebaker company has brought out a new worm-drive type, but the old line of Studebakers is continued unchanged. The General Vehicle and the G. M. C. lines remain just as they were in every respect. The Atlantic of course has not had much time in which to do any changing, this being its first big show. Its thoroughly up-to-date design and construction, conforming to generally accepted standards; it is propelled by a single motor, driving by "silent" chain to the differential on a housed jackshaft and by side chains to the rear wheels. The various models range in capacity from 1 to to 5 tons, but all are built on the same lines—a very common practice in electric vehicle building.

The Baker people are standing pat on their standard designs, having departed from standard practice only in the application of steel chain cases on the new model recently brought out, a four-ton machine. These cases are of heavy steel and not only enclose the driving chains but act as torque members, thus serving a double purpose. Otherwise the new model differs not at all from its companions. The smaller Ward cars, which originally were made with chain drive direct from motor to rear axle—single reduction—now drives through a double reduction, motor to jackshaft and thence by side chains to the rear wheels. The larger models, also with double reduction and single motor equipment, are unchanged.

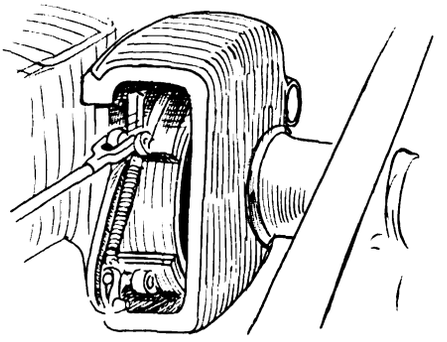
In bringing out its larger model, from 2 tons up to 5 tons, the Waverley company has abandoned its former two-motor system and has adopted a single motor drive of an extremely neat type. The motor is hung from the main frames by steel brackets, with its shaft fore-and-aft; its location is back of the rear axle and above it, and drive is through a propeller shaft with two universal joints to a housed jackshaft forward of the axle. Final drive is by side chains.

The new Lansden models, which differ considerably from the old familiar Lansdens with their long side chains, are built with single motor drive to countershaft

Digitized by Google

and thence by side chains to the rear wheels. The motor casing is bolted to the jackshaft housing, forming a unit that is rigid and unaffected by vibration. The weight of the motor is carried by a heavy cross member of the frame. The Lansden control lever, which is mounted on the steering wheel column, is provided with means for locking up with a padlock when the car is standing, absolutely preventing the current being turned on.

Bigger Motor in Lippard-Stewart.

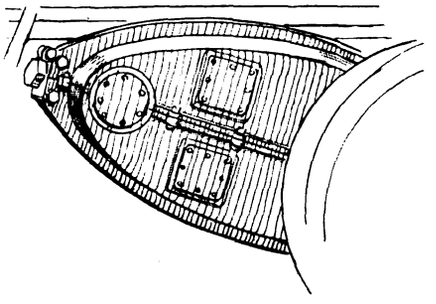


A bigger motor—30 horsepower instead of the former 22 horsepower—is the chief change in the Lippard-Stewart 1,500 pound delivery wagon, though a cone clutch has been substituted for the older disk and the motor and gearcase have been separated into two units. A feature of the exhibit is a hearse—cheerful subject!—which can be converted into a casket wagon by the addition of carved ebony panels to cover the windows and a horizontal partition to provide room for more—well, more load. The Sanford people have experienced a change of heart and abandoned the former two-cycle air-cooled three-cylinder engine for a standard make of four-cycle, four-cylinder water-cooled motor with centrifugal governor. This leaves the Chase truck the sole representative of the two-cycle air-cooled type, and it may be said that the representation is all that could be asked for. The Chase trucks remain practically unchanged, except in the inevitable minor details. The latest and littlest Chase, the 500 pound $500 car, is shown for the first time and attracts its share of attention.

"Assembled" a Standard Talking Point.

"Yes, it's an 'assembled' truck, and that's the best thing you could say about it." is the way the Standard people talk of their vehicle. Built wholly of components made by various specialists, it is a comparatively new machine that is wholly without frills or feathers. The Stegeman, in which a special point is made of fitting removable bronze bushings at every point where wear occurs, so that lost motion can be taken up easily and cheaply, also goes over without anything new. The Durable Dayton is another machine the makers of which take pride in pointing to the fact that the component parts are purchased and assembled into complete cars; and it also is an unchanged machine. The 1,500 pound and 1 ton Sullivan machines have heavier axles and are generally strengthened; the brakes are bigger and the gearcase and jackshaft have been brought together in unit form. Otherwise they are the same sturdy machines.

Detail improvements have been made in a number of machines which, however, retain all their well-known features intact and, in fact, are to all intents and purposes exactly as they were. The Sternberg, Atterbury, Modern, the Koehler, remain up-to-date without necessity for "tinkering."



A post entry, so to speak, was that of the Harwood-Barley Mfg. Co., of Marion, Ind., builders of the Indiana truck. The

WALTER ENCLOSED BRAKE

complete line consists of three machines—1½ tons, 2 tons and 3 tons capacity respectively; of these the two smaller are shown. The chief characteristics of these trucks are unchanged. The I H C cars, which are designed especially with a view to simplicity and ease of operation—which naturally includes durability, the lack of which would make the matter of operation a difficult one—are shown in horizontal water-cooled motors only, though several air-cooled models are built.

Though a number of slight changes have been made in the Grand Rapids Motor

BAKER CHAIN CASE

Truck Company's Decatur truck, the favorite "talking point" of the company's representatives is the matter of service. Arrangements have been made to have every owner of a Decatur truck visited by an expert once every 30 days, and this man inspects and advises and instructs on mechanical matters as well as helping very materially in other matters in connection with motor trucking.

Fire Apparatus Lends Dash of Color.

No motor truck show would be anything like a motor truck show if it did not include something striking in the way of motor-driven fire apparatus; and this touch of the spectacular is furnished at the Palace by the Webb Co., of Allentown, Pa., which exhibits a big pumping engine with a six-cylinder motor under the forward hood for driving the car and the pumps, and also a combination chemical and hose wagon with a four-cylinder motor. In the pumping engine the pumps are located back of the driver's seat, and power is transmitted to them through the same mechanism that drives the rear wheels. The Croce exhibit also includes a combination chemical wagon that looks extremely well able to stand the hard service to which such machines are subjected.

There is nothing new, of course, in the use of auxiliary springs designed to come to the assistance of the main rear springs of a truck when the load is in place; but there is an increasing tendency to fit these springs to trucks, and a number of examples of different types are in evidence. The Alco presents a good example of the inverted semi-elliptic spring clipped to a cross-member of the frame directly over the rear axle; the ends of the spring are clear of the axle when there is no load on the truck, and when the load is on they come down and rest on pads clipped to the axle just inside the main spring clips.

Prevalence of Auxiliary Springs.

Spiral springs are even more in evidence for this class of service. B. A. Gramm uses a single cylindrical coil on each side of the truck, resting in a socket on the rear axle, a bracket on the main frame coming down in the top of the coil when the truck is loaded. Selden also uses a single cylindrical coil which, however, is directly under the frame, which rests on the spring when under load. In the case of the Hupmobile the arrangement is the same as in the B. A. Gramm, except that the spring is of large diameter in the middle, tapering toward the ends. Peerless uses a conical coiled spring, with the small end up. In the case of the Lauth-Juergens there are two springs on each side, cylindrical coils, resting on the main spring clips; the upper bearings consist of hooded brackets riveted to the main frames.

In the Rowe exhibit there is a truck fitted with pneumatic cushions—the Klenke pneumatic suspension. Air cushions of fabric-and-rubber are interposed between the spring ends and their brackets, so that the weight comes directly on the cushions and the whole car is suspended on air. Curved plates press on the cushions, and the curvature is so worked out that the pressure per square inch of plate surface is at all times equal, regardless of the air pressure in the cushions, which are pumped up in the usual manner through a tire valve.

Digitized by Google

Summary of Trucks Comprising New York Show and Their Price Ranges

In the Garden.

American Locomotive Co., Providence, R. I.—Four Alco trucks: One 2-ton, two 3½-ton, and one 5-ton; one each 2- and 3½-ton chassis. Price range $3,160-$5,525.

Autocar Co., Ardmore, Pa.—Ten Autocar two-cylinder opposed Autocar trucks; one chassis. Price range: Chassis, $2,000; bodies from $275 to $750 extra.

Buick Motor Co., Flint, Mich.—Two Buick trucks, both 1,000 pounds capacity: One each open and panel delivery; one chassis. Price range, chassis, $975-$1,100.

Federal Motor Truck Co., Detroit, Mich.—Three Federal trucks, all one-ton capacity: One each express, panel delivery and combination chemical and hose; one chassis. Price range: Chassis, $1,800; bodies from $100 to $150 extra.

Garford Co. Elyria, Ohio—Eight Garford trucks: One each 3-ton furniture, mail, express and tank trucks, one 5-ton brewery truck, one each 6-ton power dump and coal trucks, one 12-ton tractor-trailer on 5-ton chassis; one 6-ton chassis. Price range, chassis, $2,850-$4,850.

General Motors Truck Co., Pontiac, Mich.—Four G M C trucks: One 1¼-ton, two 3½-ton trucks and one 5-ton dump truck; one each 2-, 3½ and 5-ton chassis. Price range, chassis, $2,075-$3,700.

Gramm Motor Truck Co., Lima, Ohio—One 3-ton Gramm truck and one each 2- and 5-ton chassis; one Willys 1,500-pound delivery wagon. Price range, chassis, $1,750-$4,500; price of Willys, $1,250.

Hupp Motor Car Co., Detroit, Mich.—One Hupmobile 800-pound capacity delivery wagon and one chassis. Price, chassis, $875; with body, $1,075.

International Motor Co., New York City—Five Mack trucks, one Hewitt 10-ton truck, one International 1,500-pound truck and one each 5½- and 7½-ton Saurer chassis. Chassis price range: Hewitt, $1,800-$5,500; Mack, $2,100-$2,300; International, $2,000; Saurer, $5,000-$6,000.

Kelly Motor Truck Co., Springfield, Ohio—Three Kelly-Springfield chassis: One each 1-, 1½- and 3-ton chassis. Price range $2,000-$3,400.

Kissel Motor Car Co., Hartford, Wis.—Four Kissel trucks: One each 3-, 4-, 5-ton and 1,500-pound trucks; one 1¼-ton chassis. Price range, chassis, $1,500-$4,350; bodies $125 to $150 extra.

Knox Automobile Co., Springfield, Mass.—One 3-ton Knox truck and two Martin tractors, one from 5 to 8 tons capacity and the other from 8 to 20 tons capacity. Chassis price range, Martin tractor, $3,250-$3,750; trucks, $3,000-$5,000.

Locomobile Co. of America, Bridgeport, Conn.—Two 5-ton Locomobile trucks: One combination dumping and demountable body truck and one lumber truck with "dead" wagon. Chassis price, $4,800.

Packard Motor Car Co., Detroit, Mich.—Four Packard trucks: One each 3-ton enclosed van and open express and two panel express trucks; one 5-ton chassis. Chassis price range $2,800-$4,500.

Peerless Motor Car Co., Cleveland, O.—Two Peerless trucks: One 3-ton furniture van and one 5-ton dumping truck. Chassis prices $3,700-$4,500.

Pierce-Arrow Motor Car Co., Buffalo, N. Y.—Two 5-ton Pierce-Arrow trucks: One dumping truck and one stake body truck; one chassis. Chassis price $4,500.

Pope Mfg. Co., Hartford, Conn.—Two Pope-Hartford trucks: One 3-ton stake body truck and one combination chemical and hose wagon; one 5-ton chassis. Price range $3,550-$4,675.

Reo Motor Truck Co., Lansing, Mich.—Two single cylinder Reo delivery wagons and one four-cylinder 1½- to 2-ton truck; one 1½- to 2-ton chassis. Chassis prices, with driver's seat, $700-$1,800.

Selden Motor Vehicle Co., Rochester, N. Y.—Two one-ton Selden trucks: One each express and stake body trucks; one chassis. Chassis price $2,000.

Speedwell Motor Car Co., Dayton, Ohio—Three Speedwell trucks: Two 4-ton open trucks and one 6-ton dumping truck; one 2-ton chassis. Price range, with standard bodies, $2,950-$4,500.

Velie Motor Vehicle Co., Moline, Ill.—One 2-ton Velie truck; one each 1-ton and 3-ton chassis. Chassis price range $1,650-$3,350.

Walter Motor Truck Co., New York City—Two Walter trucks: One 3½-ton furniture van and one Latil drive 2½-ton truck; one 3½-ton chassis. Price range, not including Latil drive chassis, $2,800-$5,000; Latil drive chassis, $3,200.

White Co., The, Cleveland, Ohio—Nine White trucks: One six-cylinder combination chemical and hose wagon and one each four-cylinder ambulance, 1½-ton truck, 1½-ton tower wagon, 1½-ton van, 3-ton truck, 5-ton power dumping truck and two 1,500-pound delivery wagons; one taxicab. Price range $2,250-$4,700.

In the Palace.

Atlantic Vehicle Co., New York City—One 5-ton Atlantic electric chassis. Price, $4,000.

Atterbury Motor Car Co., Buffalo, N. Y.—Four Atterbury trucks: One each 1,500-pound delivery wagon, 1-, 2- and 3-ton trucks. Price range, $1,250-$3,600.

Baker Motor Vehicle Co., Cleveland, O.—Four Baker electric trucks: One each 500-pound delivery and 4-ton truck and two 2-ton trucks; one 1-ton chassis. Price range, $1,800-$3,500.

Bessemer Motor Truck Co., Grove City, Pa.—Two Bessemer trucks: One each 1,000-pound delivery wagon and 1½-ton truck; one each 1,000-pound and 1-ton chassis. Price range, $1,200-$2,700.

Blair Mfg. Co., Newark, O.—One 2½-ton Blair truck; one 3½-ton chassis. Price range, $3,000-$3,750.

Bowling Green Motor Car Co., Bowling Green, O.—One 1,000-pound Modern delivery wagon; one 1,500-pound chassis. Price range, $1,325-$1,625.

Brown Commercial Car Co., Peru, Ind.—Two 1,500-pound Brown delivery wagons; one chassis. Chassis price, $1,650.

Chase Motor Truck Co., Syracuse, N. Y.—Three Chase trucks; One two-cylinder, two-cycle, 500-pound delivery wagon; one each three-cylinder, two-cycle, 1- and 2-ton trucks; all air cooled. Price range, $500-$2,200.

Croce Auto Co., Inc., Asbury Park, N. J.—One Croce 1,500-pound delivery wagon and one combination chemical and hose

Digitized by Google

wagon; one each 1,500-pound and 3-ton chassis. Price range, $1,850-$4,500.

Dart Mfg. Co., Waterloo, Ia.—Three Dart trucks: one each four-cylinder, four-cycle, 1,500-pound and 1½-ton trucks and one 1,000-pound, two-cylinder delivery wagon. Price range, $750-$1,790.

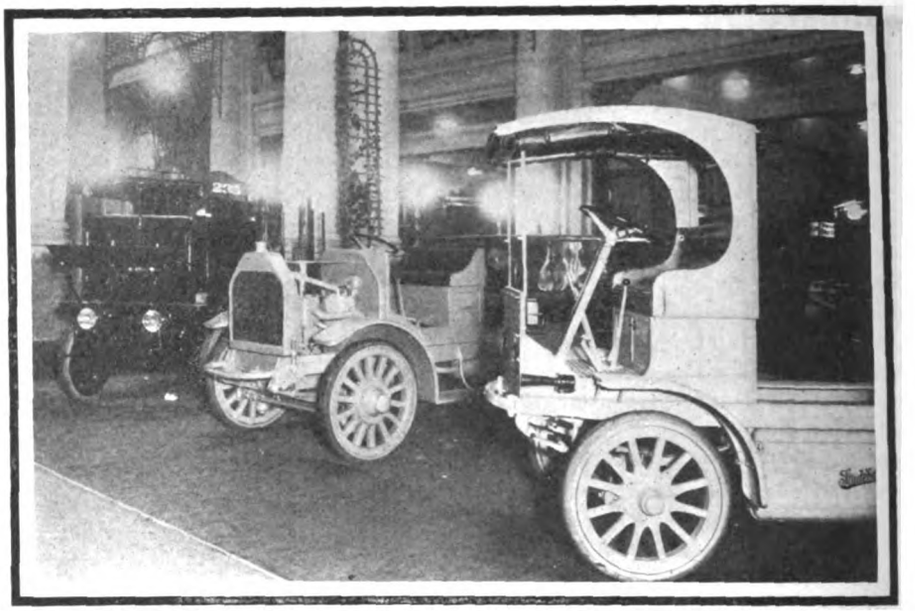
Driggs-Seabury Ordnance Corporation, Sharon, Pa.—One 4½-ton Vulcan truck and one 7-ton chassis. Price range, $3,600-$5,600.

Durant-Dort Carriage Co., Flint, Mich.—One each Flint 1,600-pound delivery wagon and chassis and one two-cylinder Best 1,000-pound chassis. Price, Flint, $875; Best, $840.

Dayton Auto Truck Co., Dayton, O.—One 3-ton Dayton chassis. Price range, $2,650-$4,500.

General Vehicle Co., Long Island City, N. Y.—Eight General Vehicle electric trucks: One each 1,000-pound, 1-ton, battery crane and industrial, 3- and 3½-ton trucks, two 5-ton trucks; one chassis.

Two G M C electric trucks: One each 1,000-pound and 5-ton; one each 1- and 3-ton chassis. Price range, $2,075-$3,700.



Gramm-Bernstein Co., Lima, O.—One Benjamin A. Gramm 2-ton truck and one 3½-ton chassis. Price range, $2,750-$3,600.

Grand Rapids Motor Truck Co., Grand Rapids, Mich.—Two 1½-ton Decatur delivery wagons. Price range, $2,200-$2,500.

Harwood-Barley Mfg. Co., Marion, Ind.—Two Indiana trucks: one each 1½- and 2-ton trucks. Price range, $2,000-$3,200

Hydraulic Truck Sales Co., New York City—One 6-ton La France truck with Manly hydraulic drive.

International Harvester Co.—Three I H C two-cylinder, 1,500-pound delivery wagons; one chassis. Price, air-cooled, $820; water-cooled, $935.

STUDEBAKER PALACE EXHIBIT WITH NEW GASOLENE TRUCK IN CENTER

Koehler Sporting Goods Co., H. J., New York City—Two two-cylinder, 1,600-pound delivery wagons; one chassis. Price range, $750-$900.

Krebs Commercial Car Co., Clyde, O.—Three Krebs trucks: One each two-cylinder, two-cycle, 1,500-pound and 1-ton trucks, and one four-cylinder, four-cycle 1½-ton truck. Chassis price, $1,375.

Lansden Co., Newark, N. J.—Six Lansden electric trucks: One each 1-ton gas wagon, 750-pound delivery wagon, 1,000-pound ambulance, two 1-ton trucks; one 3½-ton chassis.

Lauth-Juergens Motor Car Co., Fremont, O.—Three Lauth-Juergens chassis, one each 1-, 3- and 5-tons. Price range, $1,950-$3,300.

Lippard-Stewart Motor Car Co., Buffalo, N. Y.—Four Lippard-Stewart 1,500-pound trucks: One each hearse and undertaker's wagon and two delivery wagons; one chassis. Price, $1,650.

Maccarr Co., Allentown, Pa.—One 1,500-pound Maccarr truck; one chassis. Price range, $1,650-$1,900.

Mais Motor Truck Co., Indianapolis, Ind.—One 2½-ton Mais chassis. Price range, $2,750-$3,400.

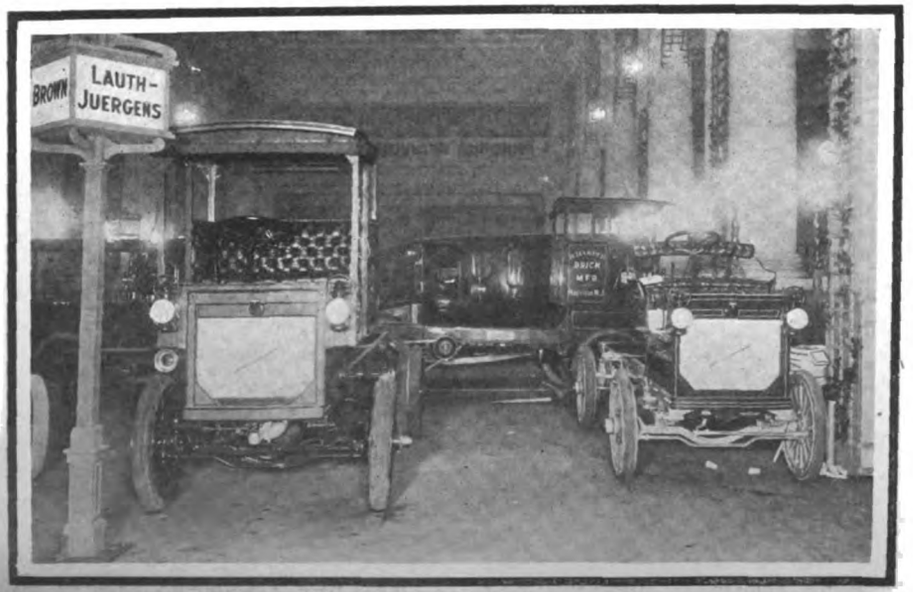
Rowe Motor Mfg. Co., Coatesville, Pa.—Two Rowe trucks: One each 1- and 2-ton trucks. Price range, $1,800-$4,800.

Sanford Motor Truck Co., Syracuse, N. Y.—One 1-ton Sanford truck and one chassis. Chassis price, $1,600.

Schacht Motor Car Co., Cincinnati, O.—Two Schacht trucks: One each 1,800-pound delivery wagon and 3-ton truck. Price range, $1,600-$3,300.

Service Motor Car Co., Wabash, Ind.—Four Service trucks: Two 1-ton express trucks, one each 1½- and 3-ton trucks; one 1½-ton chassis. Price range, $1,350-$1,675.

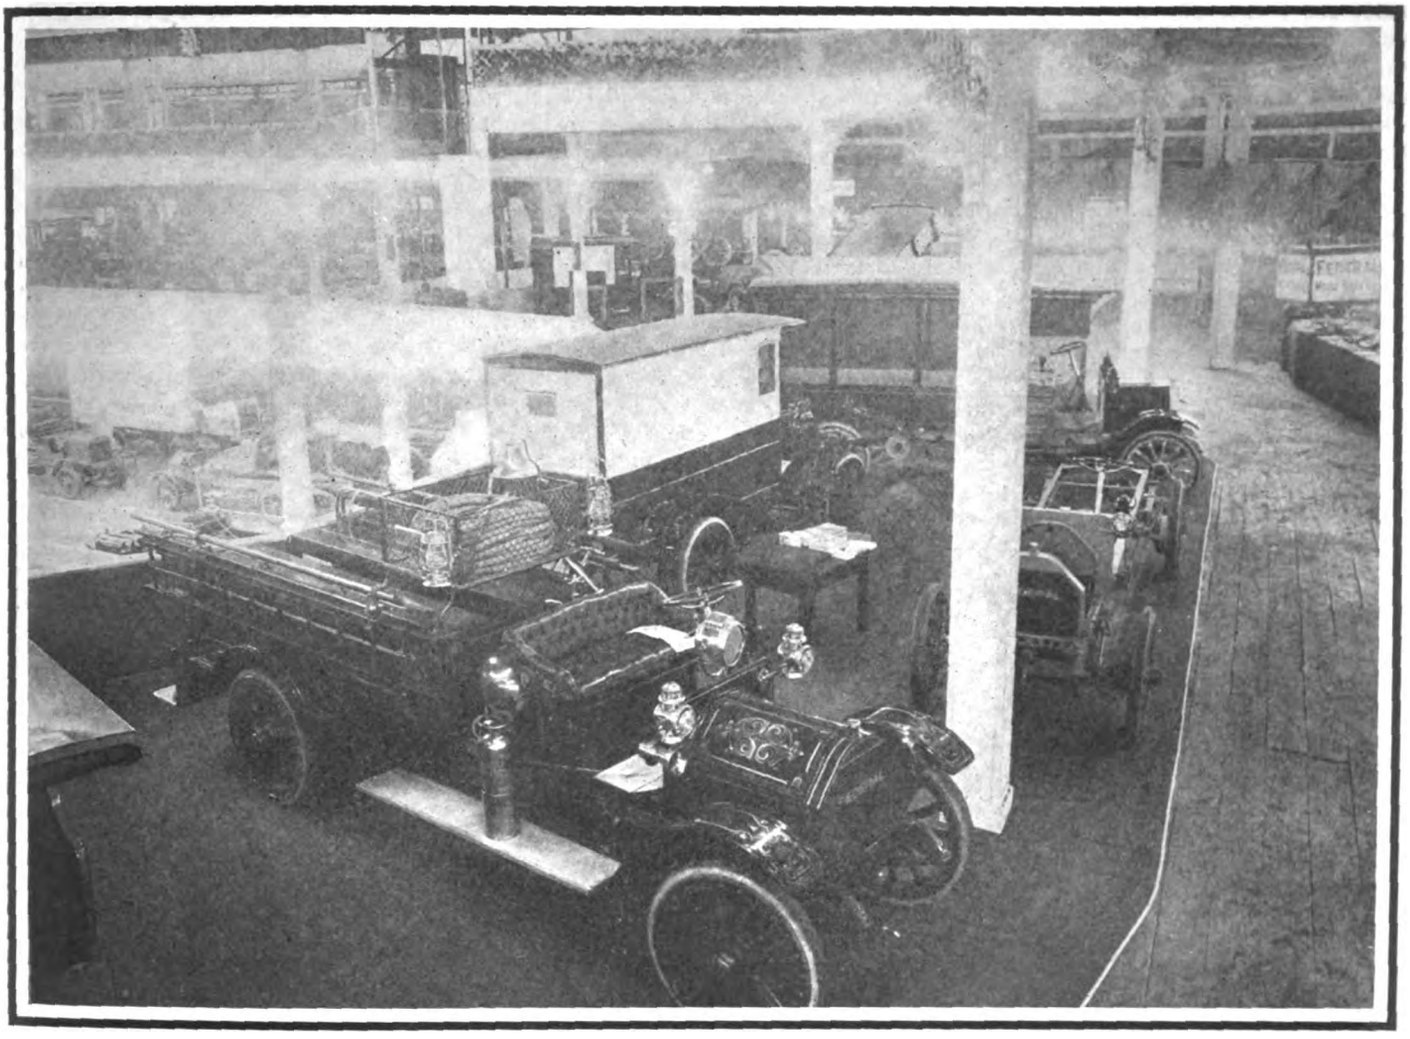
Smith Co., A. O., Milwaukee, Wis.—Two Smith-Milwaukee chassis: One each 3½- and 6-ton chassis. Price range, $3,750-$4,750.



Standard Motor Truck Co., Detroit, Mich.—One 3-ton Standard truck; one chassis. Chassis price, $2,750.

Sternberg Mfg. Co., Milwaukee, Wis.—Two Sternberg trucks: One each 3- and 4-ton; one 5-ton chassis. Prices, $2,800-$4,500.

Stewart Motor Corporation, Buffalo, N. Y.—Three Stewart 1,500-pound delivery wagons; one chassis. Chassis price, $1,650.



Studebaker Corp., Detroit, Mich.—Two Studebaker gasolene trucks and three electric trucks: One each gasolene 1,000-pound and 3-ton; one each electric 1,000-pound, 1-ton and 1½-ton. Price range, eelctric, $1,500-$3,000; gasolene, $850-$3,000.

Sullivan Motor Car Co., Rochester, N. Y.—

LAUTH-JUERGENS DISPLAY AS IT IS ARRANGED IN THE PALACE

Digitized by Google

FEDERAL EXHIBIT ON THE GARDEN ELEVATED PLATFORM OVERLOOKING THE "ARENA"

Two two-cylinder Sullivan trucks: One each 1,000-pound and 1,500-pound. Price range, $925-$950.

Universal Motor Truck Co., Detroit, Mich.—Two Universal trucks: One each 1-ton and 3-ton; one chassis. Price range, $2,750-$3,400.

Ward Motor Vehicle Co., New York City.—Three Ward electric trucks: One each 1-, 2- and 4-ton trucks; one 1,000-pound chassis.

Waverley Co., Indianapolis, Ind.—Two Waverley electric trucks: One each 1,000-pound delivery and 5-ton truck; one chassis; and one roadster pleasure car. Price range $1,800-$4,000.

Webb Co., Allentown, Pa.—Two Webb fire apparatus vehicles: One 6-cylinder combined pump, chemical and hose wagon and one four-cylinder combined chemical and hose wagon.

Truck Tire Development Disclosed in Accessory Department

In the matter of accessories, but little that is new, and only one that approaches the radical was revealed by the shifting of the scenes. One new cast steel wheel makes its appearance, the product of the Johnson Steel Wheel Corporation, Boston. In common with the several steel wheels which cropped out during the first week, Johnson wheels are cast with hollow oval spokes by way of reducing weight to a minimum and eliminating strains due to unequal cooling. Spokes, rim, hub, brake drum and seat for the driving sprocket are cast integral and all machine work is done at one setting of the boring mill, resulting in a perfectly concentric finished product. For lighter trucks, the rims also are cast hollow. The wheels are made of crucible steel alloyed with vanadium and titanium, acid open hearth steel or electric refined steel, according to conditions.

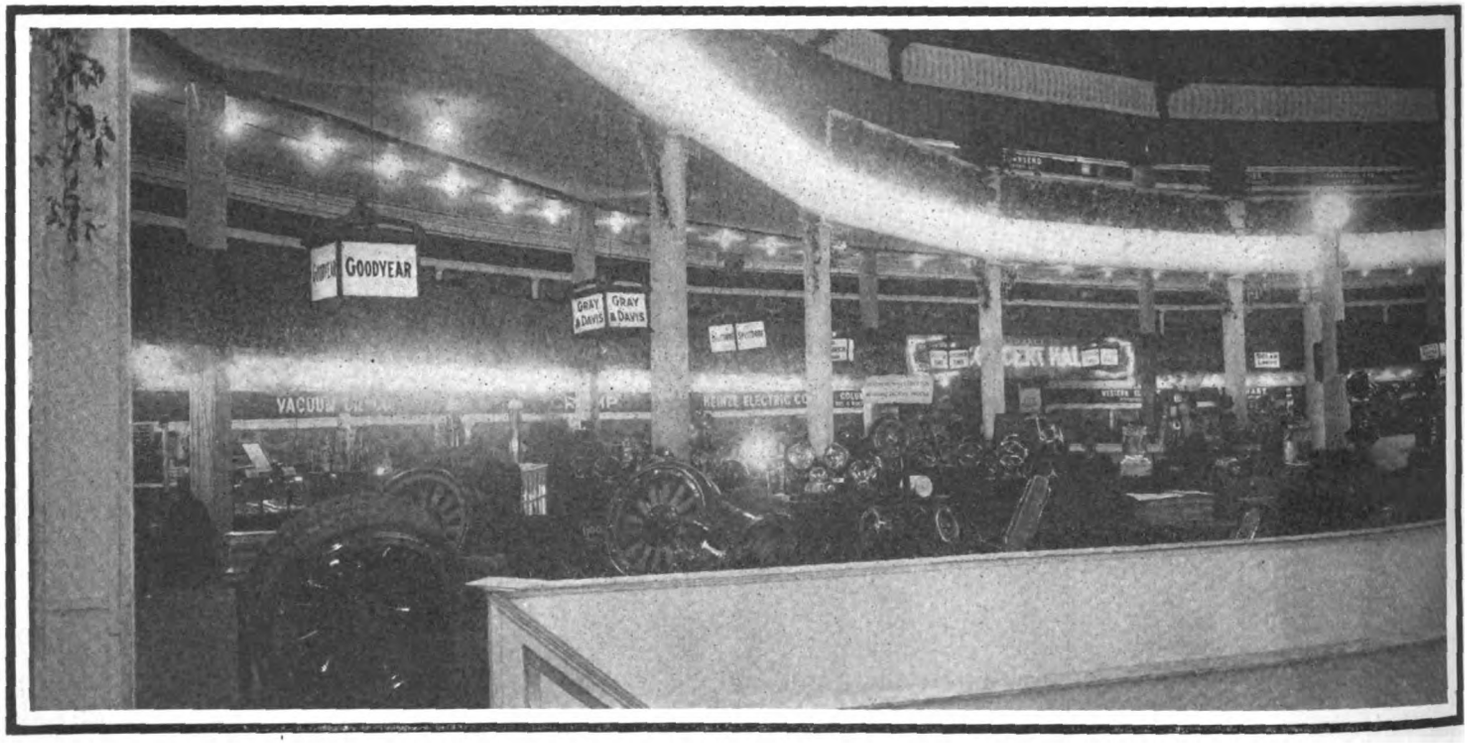
It is in the tire line that a near-radical article appears—the Pioneer steel block tire, exhibited by the Pioneer Steel Block Tire Co., St. Louis, Mo. As the designation would imply, the tire is made up of a series of steel blocks similar to the rubber blocks on the ordinary block tire construction and with the ends cut off at an angle by way of eliminating bumps at the intersections. The blocks are cast hollow and are mounted on a heavy rubber pad which covers the periphery of the wheel so that shocks are transmitted through the blocks to the rubber and absorbed. By way of eliminating the slight shocks, a pair of helical springs is placed in the hollow of each block and arranged to operate against a plate which rests upon the rubber pad. The tire is retained in place on the wheel by a pair of flanged rings which are bolted to the wheel rim, the flanges gripping opposing flanges cast on the base of the blocks. Both single and dual equipment are made.

New in the truck tire line is the Standard block tire just announced by the United States Tire Co. In its simplest aspect, the tire embraces the use of a double flange band which slips over the felloe and separates the two series of blocks, and two dozen flange plates which bolt to the wheel

Digitized by Google

felloe and engage with the similar projections on the base of the blocks and serving to keep the blocks in place. Two bolts pass through each plate and clear through the wheel rim to the other side. Naturally the blocks are staggered when in position with a consequent elimination of bumps when in use on smooth pavements, and as a matter of course the flange plates are staggered with relation to each other in the same manner, so that by loosening two bolts and prying the flange plate away from the block, any of the blocks can be quickly and easily removed.

Of totally different design, yet embodying the accessibility feature, in that any of the blocks can be removed simply by the removal of two bolts, is the new block truck tire made by the Republic Rubber Co. In the Republic design the blocks are supported by plates which bolt to the periphery of the wheel, the blocks protruding through suitable holes in the plates which, when in place, clamp against the base flanges. Each plate serves to hold two blocks, one on either series, so that the plates assume a zig-zag shape. The two bolts which clamp the plates to the periphery of the wheel are positioned between the blocks. Also new in the Republic line is a non-demountable wireless tire, of which a feature is a semi-hard base.



Soft base, side flange clincher types of solid rubber tires, designed for use in connection with Q. D. rims as ordinarily supplied for pneumatic tire use, are shown by the Goodyear Tire & Rubber Co. By way of rendering the tires durable, reinforcement in the shape of short wires which are laid diagonally across near the base is employed, and in order that creeping, which naturally would cause excessive wear, will not occur, the base is formed so that the distance between flanges is slightly in excess of the width of the rim. When bolted into position the tire is compressed and creeping is impossible. For especial use with fire-fighting apparatus the Goodyear company has brought out a demountable cushion tire of the Motz type, which, it is claimed, is very nearly as resilient as the penumatic tire and equally as economical of power, and, moreover, by virtue of the cavities cut in the periphery is valuable as an anti-skid. In common with the soft base tires, it is put out in widths of from 3 to 6 inches and in diameters to meet all requirements.

V. C. tires are the products which mark the entrance of the Pennsylvania Rubber Co. into the commercial vehicle field. They are of the demountable type, provided with steel bases, and are made in carrying capacities from 950 to 4,000 pounds for single tires and from 2,500 to 10,000 pounds for duals.

A continuous base block tire, flanged for attachment to Q. D. rims, is offered by the Swinehart Tire & Rubber Co. The tire comprises a soft base with the blocks vulcanized in place; creeping is prevented by making the base slightly oversize so that the tire is clamped tightly in place. The Firestone Tire & Rubber Co. also is exhibiting a soft base tire for use on clincher rims, the base being reinforced with diagonal wires, and a cushion tire for use with light commercial vehicles.

One type of tire grip not covered by the Motor World's Before Shows issue is on view, the product of the Lyon Non-Skid Co., Philadelphia, Pa. The device is intended for use only on solid tires and comprises three sections which are attached to each other by means of pins to form a rigid body which will not shift on the tire. That portion of the grip which comes in contact with the tread has been rounded off by way of reducing wear on the tire to a minimum; flexible alloy steel enters into the construction, so that the device will not cause bumps when the wheel is traveling over smooth roads. Attachment is by means of three taper split pins which are placed from in front of the wheel; a turn buckle for tightening the grip on the tire before the last pin is inserted forms part of the equipment.

The Travelog is the latest addition to the very many truck recorders on the market. It comprises an eight-day jewelled Howard clock mounted in a pressed steel case which is positioned on the dash and designed to cause a graduated chart to rotate once every 24 hours. Naturally, the record disk is graduated with a scale representing the hours. Contacting with the chart is a styllus operated by a very sensitive pendulum; when the pendulum is set in motion by the vibration of the vehicle, the styllus traces lines which take the direction of the radii of the disk, and since the movement of the disk is relatively slight as compared with the more or less rapid vibration

CORNER OF THE ELEVATED PLATFORM IN THE GARDEN WITH THE FISK TIRE EXHIBIT IN THE FOREGROUND

Digitized by Google

of the pendulum, the tracings assume the form of bands of various widths, according to the amplitude of vibration of the pendulum When the motor is stationary, the styllus traces a spiral path starting at the periphery of the disk and traveling toward the center, so that a single chart can be used for a week without interference of the tracings. The varying width of the tracings records the movements of the truck. Naturally the device is sealed against tampering by the driver and is put out in two forms—with a glass case cover and with a pressed steel cover. The device is made by W. H. Brown of Cleveland, Ohio.

Summary of Accessory Exhibits at New York Truck Show

* Denotes exhibit in Palace; ** in both buildings; undesignated, in Garden.

Ajax-Grieb Rubber Co., New York City—Ajax tires.

American Kushion Kore Tire Co., New York City—Tire fillers.*

American Metal Hose Co., Waterbury, Conn.—Flexible metal pipe.*

American Ball Bearing Co., Cleveland, Ohio—American axles and worm gearing.

American Tire & Rubber Co., Akron, Ohio—American inner tubes.*

American Spring Wheel Co., Nashville, Tenn.—Seaton spring wheels.

American Taximeter Co., New York City—Jones and Popp taximeters and Specograph truck recorders.

Aristes Co., New York City—Mondex shock absorbers, Magic motors and gearsets.

Automobile Supply Mfg. Co., Brooklyn, N. Y.—Newtone signals.

Badger Brass Mfg. Co., Kenosha, Wis.—Solar lamps.

Baldwin Chain & Mfg. Co., Worcester, Mass.—Baldwin chains.

Baldwin Steel Co., New York City—Baldwin steels.

Barthel, Daly & Miller, New York City—Schaefer ball bearings.

Benford Mfg. Co., Mt. Vernon, N. Y.—Monarch plugs and headlight lighters.

Bower Roller Bearing Co., Detroit, Mich.—Bower roller bearings.

Bowser & Co., S. F., Ft. Wayne, Ind.—Fuel pumps and storage systems.

Braender Rubber & Tire Co., Rutherford, N. J.—Braender tires.

Briggs Magneto Co., Elkhart, Ind.—Briggs magnetos and lighting systems.

Brown, W. H., Cleveland, Ohio—Travelog truck recorders.

Brown-Lipe Gear Co., Syracuse, N. Y.—Brown-Lipe gears and gearsets.

Buda Co., Harvey, Ill.—Buda motors and gearsets.**

Budd Mfg. Co., Edward G., Philadelphia, Pa.—Pressed steel bodies.

Bullard Machine Tool Co., Bridgeport, Conn.—Machine tools.

Byrne, Kingston & Co., Kokomo, Ind.—Kingston carburetters.

Carnegie Steel Co., Pittsburgh, Pa.—Steels.

Champion Ignition Co., Flint, Mich.—A-C spark plugs.

Chicago Drop Forge & Foundry Co., Chicago, Ill.—Drop forgings.

Coes Wrench Co., Worcester, Mass.—Wrenches.

Connecticut Telephone & Electric Co., Meriden, Conn.—Connecticut shock absorbers, magnetos and ignition devices.

Cooks Sons, Adam, New York City—Albany grease and lubricating oils.

Cotta Transmission Co., Rockford, Ill.—Cotta gearsets.

Cramp & Sons Ship & Engine Bldg. Co., Wm., Philadelphia, Pa.—Parsons's white brass and bronze bearing metals, bearings and worm gears.**

Dean Electric Co., Elyria, Ohio—Tuto and Rexo signals, Dynalux electric lighting systems, Otho and Elyria-Dean electric lighting and starting systems, Hi-Fre-Co ignition systems.*

Diamond Chain & Mfg. Co., Indianapolis, Ind.—Diamond chains.

Dixon Crucible Co., Jos., Jersey City, N. J.—Graphite lubricants.

Duplex Gasolene Motor Co., New York City—Two-stroke motors.

Edmunds & Jones Mfg. Co., Detroit, Mich.—Lamps.

Electric Storage Battery Co., Philadelphia, Pa.—Exide storage batteries.

Englebert Tire Co., New York City—Tires.

Eureka Non-Skid Mfg. Co., Brooklyn, N. Y. Non-skid devices.

Everland Eng. & Mfg. Co., Philadelphia—Machine tools.

Fairbanks Co., New York City—Machine tools.

Favary Tire & Cushion Co., New York City—Favary cushion tires.

Federal Chain & Mfg. Co., Springfield, Mass.—Federal non-skid devices.

Findeisen & Kropf, Chicago, Ill.—Rayfield carburetters.

Fischer Steel & Iron Works Co., Switzerland—Fischer steels.

Firestone Tire & Rubber Co., Akron, Ohio—Firestone tires.

Fisk Rubber Co., Chicopee Falls, Mass.—Fisk tires.

Fletcher & Co., L. V., New York City—American Locomotive carburetters.

Frasse, Peter, New York City—Fischer steels.

Gabriel Horn Mfg. Co., Cleveland, Ohio—Gabriel horns and rebound snubbers.

Gasolene Filter Co., New York City—Perfect gasolene filters.

Garvin Machine Co., New York City—Machine tools.

Gemmer Mfg. Co., Detroit, Mich.—Gemmer steering gears.

General Rim Co., New York City—Rims.

Gibney Rubber Co., J. L., Philadelphia, Pa.—Tires and vulcanizers.

Globe Machine & Stamping Co., Cleveland, Ohio—Steel tool boxes, metal hampers, fenders and sheet metal parts.

General Electric Co., Schenectady, N. Y.—Electric motors, rectifiers, etc.

Goodrich Co., B. F., Akron, Ohio—Goodrich tires.

Goodyear Tire & Rubber Co., Akron, Ohio—Goodyear tires.

Gould Storage Battery Co., New York City—Gould batteries and Duplex lighting and ignition system.*

Gray & Davis, Amesbury, Mass.—Lamps and electric starting and lighting systems.**

Haedge & Richter, Hanover, Germany—Rivets and riveting machines.*

Harris Oil Co., A. W., Providence R. I.—Lubricants.

Hartford Suspension Co., Jersey City, N. J.—Truffault-Hartford shock absorbers, Hartford electric starting and lighting systems and jacks and bumpers.**

Havoline Oil Co., New York City—Havoline lubricants.

Hess-Bright Mfg. Co., Philadelphia, Pa.—Hess-Bright ball bearings.

Hess Steel Castings Co., Bridgeton, N. J.—Steel castings.*

Heinze Electric Co., Lowell, Mass.—Magnetos and coils.

Hesey-Wolf Machine Co., Cincinnati, Ohio—Machine tools.

Hoffman Co., George W., New York City—Metal polishes.*

Homo Co. of America, Philadelphia, Pa.—Homo carburetters.**

Hyatt Roller Bearing Co., Newark, N. J.—Hyatt flexible spiral steel roller bearings.

Haupert Machine Co., New York City—Machine work.

International Accessories Mfg. Co., New York City—A. B. C. carburetters.

Ingersoll-Rand Co., New York City—Pumps.*

Janney-Steinmetz & Co., Philadelphia, Pa.—Cold drawn, seamless steel tanks.

Johnson Steel Wheel Corp., Boston, Mass.—Steel wheels.

Jones & Co., Phineas, Newark, N. J.—Wood wheels.

Digitized by Google

Kahnweiler Sons, David, New York City—Simplex fire extinguishers.

Kells Mfg. Co., W. J., New York City—Radiators.

Kent Mfg. Works, Atwater, Philadelphia, Pa.—Unisparker ignition systems and Monoplex horns.

Kelly-Springfield Tire Co., New York City—Kelly-Springfield tires.

K-W Ignition Co., Cleveland, Ohio—K-W magnetos and coils.

Leeds & Northrup Co., Philadelphia, Pa.—Pyrometers and testing instruments.*

Lees-Bradner Co., Cleveland, Ohio—Machine tools.

Model Gas Engine Works, Peru, Ind.—Model motors.

Mosler & Co., A. R., Mount Vernon, N. Y.—Spitfire spark plugs and Umph timers.

Motometer Co., New York City—Motometer temperature indicator.

Motsinger Devices Mfg. Co., Pendleton, Ind.—Autosparkers and carburetters.

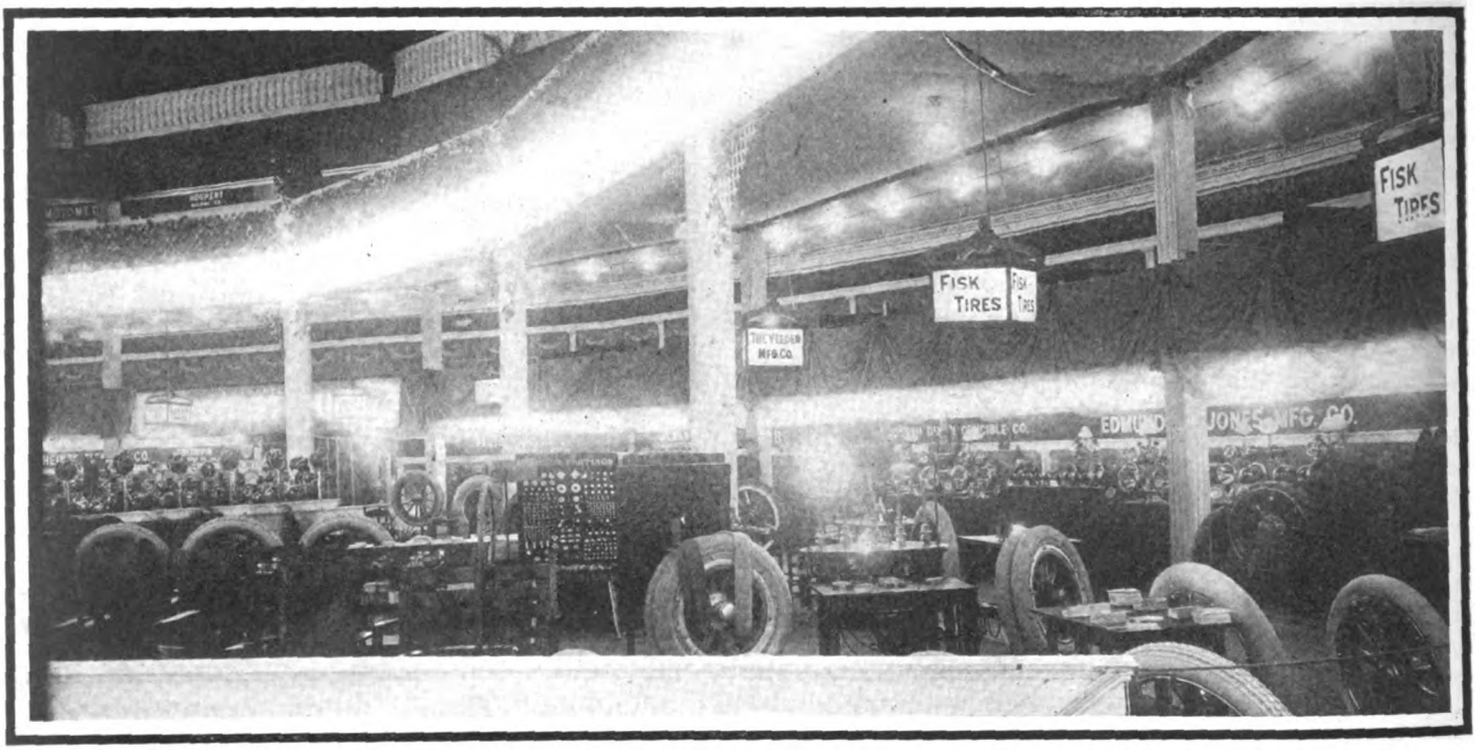
Motz Tire & Rubber Co., Akron, Ohio—Motz cushion tires.

Muncie Gear Works, Muncie, Ind.—Gears, wheels and gearsets.**

National Rubber Co., St. Louis, Mo.—Tire preservative.**

Perfection Spring Co., Cleveand, Ohio—Krupp steel springs.

Philadelphia Storage Battery Co., Philadelphia, Pa.—Philadelphia batteries.*



Pioneer Steel Block Tire Co., St. Louis, Mo.—Pioneer tires.

Polack Tire Co., New York City—Polack tires.

Potter & Johnston Mch Co., Pawtucket, R. I.—Machine tools.

Prosser & Son, Thos., New York City—Krupp steels.

Randall-Faichney Co., Boston, Mass.—Jericho and Jubilee exhaust horns, muffler cut-outs, B'Line grease guns, Jericho gas

GOODYEAR EXHIBIT ON GARDEN ELEVATED PLATFORM WITH GRAY & DAVIS DISPLAY IN BACKGROUND

Lefevre Arms Co. Syracuse, N. Y.—Lefevre gearsets.

Light Mfg. & Foundry Co., Pottstown, Pa.—Aluminum parts and castings.

Lindhe Shim Co., Brooklyn, N. Y.—Bearing shims.

Link Belt Co., Philadelphia, Pa.—Silent chains.

Lyon Non-Skid Co., Philadelphia, Pa.—Lyon grips.

Marburg Bros., Inc., New York City—Mea magnetos, S. R. O. bearings.

Manufacturers Foundry Co., Waterbury, Conn.—Castings.

McCord Mfg. Co., Detroit, Mich.—Radiators, lubricators, fans and McKim gaskets.

Merchant & Evans Co., Philadelphia, Pa.—Hele Shaw clutches, gearsets, Star tire cases.

Miller, Chas. E., New York City—Brampton chains, Pan-American oils, Miller plugs.

National Tube Co., Pittsburg, Pa.—Seamless steel tubing.

Never Skid Mfg. Co., New York City—Anti-skid devices.

New Departure Mfg. Co., Bristol, Conn.—New Departure ball bearings.

Newmastic Tire Co., New York City—Newmastic tire filler and demountable rims.**

New Miller Carburetter Co., Indianapolis, Ind.—New Miller carburetters.

New York & New Jersey Lubricants Co., New York City—Columbia lubricants.

Norma Co. of America, New York City—Norma ball bearings.*

North East Electric Co., Rochester, N. Y.—North East electric lighting and starting systems.

Overman Tire Co., New York City—Overman tires.

Peacock, Clarence H., New York City—Ames shock absorbers.

Pennsylvania Rubber Co., Jeannette, Pa.—Pennsylvania tires.

regulators, Webster tank gauges and other sundries.

Remy Eectric Co., Anderson, Ind.—Remy magnetos and lighting systems.

Republic Rubber Co., Youngstown, Ohio—Republic tires.

Rhineland Machine Works Co., New York City—Rhineland bearings.

Rich Tool Co., Chicago, Ill.—Tools and tungsten valves.*

Riker, Malcolm D., New York City—Transportation expert.*

Rose Mfg. Co., Philadelphia, Pa.—Neverout lamps, license brackets, and heaters.

Ross Gear & Tool Co., Lafayette, Ind.—Tools.*

Royal Equipment Co., Bridgeport, Conn.—Duplex and Raymond brakes, Raybestos brake linings, Gyrex mixers.

Sarco Engineering Co., New York City—Coventry chains.

Schrader's Sons, Inc., A., New York City—

Digitized by Google

Universal tire valves and pressure gauges.
Schwartz Wheel Co., Philadelphia, Pa.—Wood wheels.
Service Recorder Co., Chicago, Ill.—Truck recorders and hub odometers.
Sewell Cushion Wheel Co., Detroit, Mich.—Cushion wheels.
Sheldon Axle Co., Wilkes-Barre, Pa.—Axles and springs.
Simms Magneto Co., New York City—Simms magnetos.**
Smith Co., A. O., Milwaukee, Wis.—Parts.
Spicer Mfg. Co., Plainfield, N. J.—Spicer universal joints.
Splitdorf Electrical Co., Newark, N. J.—Splitdorf magnetos, coils, plugs and otner ignition devices, also electric lighting systems.*
Standard Roller Bearing Co., Philadelphia, Pa.—Standard ball and roller bearings.
Standard Welding Co., Cleveland, O.—Stanweld rims and parts.
Stewart & Clark Mfg. Co., Chicago, Ill.—Stewart speedometers.
Stromberg Motor Devices Co., Chicago, Ill.—Stromberg carburetters.
Sunderman Safety Carburetter Co., Newburgh, N. Y.—Sunderman carburetters.
Suspension Roller Bearing Co., Sandusky, Ohio—Suspension roller bearings.
Swinehart Tire & Rubber Co., Akron, Ohio—Swinehart tires.
Texas Co., New York City—Texaco lubricants.*
Timken-Detroit Axel Co., Detroit, Mich.—Timken hollow cast steel wheels and bevel and worm axles.**
Timken Roler Bearing Co., Canton, Ohio—Timken taper roller bearings.**
Torbenson Gear & Axle Co., Newark, N. J.—Axles.
Townsend & Co., Orange, N. J.—Townsend grease guns.**
Turner Brass Works, Sycamore, Ill.—Tire pumps, brazing apparatus, motor cleaners.
Tyer Rubber Co., Andover, Mass.—Tyrian tires.*
United States Gauge Co., New York City—Tire gauges.
United States Light & Heating Co., New York City—U. S. L. starting and lighting systems and storage batteries.**
U. S. Tire Co., New York City—United States tires.
Vacuum Oil Co., New York City—Mobil oils and greases.
Valentine & Co., New York City—Varnishes.
Veeder Mfg. Co., Hartford, Conn.—Veeder tachometers, odometers and die cast parts.
Vesta Accumulator Co., Chicago, Ill.—Vesta storage batteries and lighting systems.
Warner Gear Co., Muncie, Ind.—Gears and parts and Gardner engine starters.**
Warner Mfg. Co., Toledo, Ohio—Gearsets.
Warner Instrument Co., Beloit, Wis.—Warner autometers.*
Weed Chain Tire Grip Co., New York City Weed chains.
Wells Bros. Co., Greenfield, Mass.—Screw cutting tools.*
Western Electric Pittsfield Co., Pittsfield, Mass.—Pittsfield magnetos, coils, timers, etc.
Wasson Piston Ring Co., Hoboken, N. J.—Piston rings.
West Side Y. M. C. A., New York City—Instruction.
Weston-Mott Co., Flint, Mich.—Axles and parts.
Westinghouse Electric & Mfg. Co., Pittsburgh, Pa.—Motors, starting and lighting outfits, vulcanizers, horns, etc.*
Wheeler & Schebler, Indianapolis, Ind.—Schebler carburetters.**
Whitney Mfg. Co., Hartford, Conn.—Whitney chains.
Willard Storage Batttery Co., Cleveland, Ohio—LBA storage batteries.
Williams Co., J. H., Brooklyn, N. Y.—Drop forgings and wrenches.
Willey Co., Long Island City, N. Y.—Paints and colors.
Wolverine Lubricants Co., New York City—Wolverine lubricants.
Young, O. W., Newark, N. J.—Lubricants, tire repair outfits.

Detroit to Have an Automobile Laundry.

Automobile Laundry is the style of a company which just has been organized under Michigan laws with an authorized capital of $10,000 and the character of which is only indirectly suggested by its title. The laundry work which it will perform will be the washing and polishing of automobiles and the cleaning of engines by compressed air. The incorporators of the company, which will locate at 1221-29 Woodward avenue, Detroit, are Lew F. McCutcheon, Herbert F. Nelson and Frank D. McCormack. The system which will be applied provides for the entrance at one door of a dirty car which, after making a complete circuit of the laundry, will make its exit through another door in spick and span condition, the process requiring only 15 to 20 minutes, different crews of men being employed.

Big Automobile Building at 'Frisco Fair.

To house the exhibits of automobiles and accessories which will form a part of the Pacific-Panama Exposition in San Francisco in 1915, the National Association of Automobile Manufacturers has arranged for the erection of a special automobile building, 300 x 600 feet, or about four times as large as Madison Square Garden, New York, or the Coliseum in Chicago. It is the intention to throw open the building not merely to American cars, motorcycles and accessories, but to invite foreign manufacturers to share the structure, instead of exhibiting in the Transportation Building, as originally planned.

$100,000 for a Gasolene Alternative.

By way of spurring inventors and chemists and others on to the perfection of an alternate fuel that shall be cheaper than gasolene while retaining all its advantages, it was decided at the last meeting of the International Association of Recognized Automobile Clubs, held in Paris, to offer a prize of $100,000 to any one, irrespective of nationality, successfully solving the problem. In order to obtain the prize money a world-wide fund will be opened. A special organizing committee, with Baron de Kuylen de Nyvelt as chairman, was appointed.

Stern Punishment for Drunken Drivers.

The Fitzgerald bill, designed to make harder the way of the drunken chauffeur in New York, is now a law. It was signed by Governor Sulzer on Thursday last, 16th inst., and was, indeed, the first measure to which the new executive attached his signature. It imposes a penalty of a year's imprisonment, or a fine of $500, or both, upon any person driving a motor vehicle while intoxicated.

Paris Show Advanced to October.

With the success of the recent French show marred only by the fact that it came at a time when manufacturers were busy with preparations for the coming season, and it therefore interfered slightly with the work, it has been decided to eliminate future trouble of the kind by the simple expedient of holding the show earlier; the next French show is scheduled for October, 1913. It is hoped by shifting the date, which thus brings the French show ahead of the British one, to increase the number of exhibits by staging the show at a time when factories are less pushed.

Show Indicator that Directed Visitors.

At the recent Paris show there was employed a clever device which might work well at an American show or at any other show, for that matter. In its simplest aspect, it consisted of a floor plan of the exhibition hall on ground glass with the exhibition spaces plainly marked on it. Beneath the plan, which normally was dark, there were alphabetically arranged a row of buttons, one for each exhibitor. To determine the location of any exhibit merely required that the exhibitor's button be pressed, thus illuminating a miniature electric lamp behind the position of the exhibitor's space on the ground glass.

57 Dealers Stage 68 Car Exhibits in Philadelphia

Evidently those who had to do with the staging of the twelfth annual show of the Philadelphia Automobile Trade Association, which opened on Saturday evening last, 18th inst., in the garage building of the Automobile Club of Philadelphia, believe that an automobile exhibit is meant primarily for the exploitation of motor cars and accessories, and not of the decorations, or else the building did not readily lend itself to ornamentation; at any rate, scenic panels which serve to cover the walls was the chief form of embellishment attempted. As was the case last year, the doors will swing wide for two weeks, the space being devoted to the exhibition of commercial vehicles during the second week.

Three floors of the mammoth building are needed adequately to display the 68 different automobile exhibits which are shown by 57 dealers. The accessory dealers, 25 strong, come into their own on the top floor. The full list of motor car exhibitors is as follows:

American Automobile Co., American and Speedwell; Automobile Co. of Philadelphia, Marmon; Bergdoll Motor Co., Bergdoll; Detroiter Phialdelphia Co., Detroiter; Fiat Automobile Co., Fiat; Jackson-Stutz Sales Co., Jackson and Stutz; Thomas B. Jeffery Co., Rambler; Krit Motor Car Co., Krit; Longstreth Motor Car Co., Alco; Mitchell Motor Co., Mitchell; North Philadelphia Auto Station, Knox; Oldsmobile Co. of Pennsylvania, Oldsmobile; Overland Motor Co., Overland; Regal Sales Organization, Regal; Padula Motor Co., Havers; R. C. H. Corp., R. C. H. and Hupp-Yeats electric; Standard Motor Car Co., Velie; J. H. Schumacker Co., Dorris; Wallace Auto Co., Pope-Hartford; Automobile Sales Corp., Cadillac; J. C. Bartlett, Woods and Detroit electrics; Cartercar Motor Co., Cartercar; Gawthorp & Wister, Pathfinder; D. Walter Harper, Case; Imperial Automobile Co., Imperial; General Motor Car Co., Lozier, Paige and Rauch & Lang electric; Carroll A. Haines & Co., Baker electric and Herreshoff; E. C. Johnston Co., Premier and Reo; Johnston Motor Car Co., Haynes and Henderson; Locomobile Co. of America, Locomobile; Kissel Motor Car Co., Kissel; Peerless Motor Car Co., Peerless; Stanley Motor Car Co., Stanley; Thorntonfuller Auto Co., Simplex and S. G. V.; White Co., White; Winton Motor Co., Winton; Buick Motor Co., Buick; Chalmers Motor Car Co., Chalmers; Eldridge Co., Garford; Ford Motor Co., Ford; Foss-Hughes Co., Pierce-Arrow; Gomery-Schwartz Motor Co., Hudson; Oakland Motor Co., Oakland; Michigan Motor Co., Michigan; Packard Motor Co., Packard; F. B. Stearns Co., Stearns; A. G. Toledo Show Twice as Large as 1912 Function

If the size of the annual automobile show can be construed as an indication of the trade conditions in a locality, and it seems perfectly plausible for such to be the case, then Toledo, Ohio, has resorted to the use of "seven league boots," figuratively speaking, with regard to automobile matters, since the closing of the third annual show of the Toledo Auto Shows Co., which was staged last winter, and the opening on Monday evening last, 20th inst., of the fourth exhibit in the Terminal Building. Exhibits and exhibitors are very nearly twice as numerous as was the case in 1912, and, as a matter of course, in order adequately to take care of the greater number, floor space has been doubled; the present exhibit is housed in both of the exposition halls. In all there are 52 products, both pleasure and commercial, of as many different factories displayed by some 29 dealers; accessories are exhibited by 17 supply dealers.

In the matter of decorations, both rooms have been transformed into Southern gardens. Palms mark the aisles and bound the booths, green carpet in semblance of grass, as a matter of course, covers the floor, and from the green and white and blue and white draperies which hide the ceilings in either hall, dangle very many flower-bedecked electric light globes, invisible during the daylight hours because of the mass of entwined foliage. Walls are covered with paintings which heighten the garden effect.

Among the exhibitors of vehicles are the following:

Abbott Motor Sales Co., Abbott-Detroit; H J. Adams, Reo; Atwood Automobile Co., Overland, Marmon, and Standard electric; Auglaize Motor Car Co., Auglaize; Auto Exchange Co., Regal; Banting Machine Co., Paterson and Krebs commercial; Baumgardner & Kibby, Oakland and Columbus electric; Blovins Auto Sales Co., Sandusky trucks; Bunnell Auto Sales Co., Cole and Little; Clyde Auto Sales Co., Detroiter and Nyberg; Cornelius-Hohly Auto Co., Imperial; Dennis Motor Car Co., Rambler, Detroit electric and Alco trucks; Ford Bros. Auto Sales Co., Michigan and Krit; Gamble Motor Car Co., Peerless, Garford and Ohio and Baker electrics; Gauntlett Auto Sales Co., Buick and G. M. C. trucks; Grasser Motor Co., Hupmobile; M. E. Humbarger, Apperson; E. W. K'Burg, Stearns, R. C. H., and Hupp-Yeats electric; Landman - Griffith - McIntyre Motor Co., Flanders, Flanders electric and Stoddard-Dayton; Litchie Automobile Co., Cadillac; Maumee Motor Car Co., Empire and King; Moore Motor Truck Co., Moore trucks; Roberts-Toledo Auto Co., Ford; Standard Auto Co., Packard, Imperial and R. & L. electric; H. E. Thorne, Mitchell and Paige-Detroit; Toledo Motor Sales Co., Hudson; Union Supply Co., Pierce-Arrow and Chalmers; White Motor Car Co., White pleasure and commercial.

Automobile Horns as Factory "Whistles."

Because its factory whistle could not be heard above the din of its whirring screw machines, with the result that much playtime was lost by workmen who failed to "knock off" on time, a Worcester, Mass., factory has been equipped with a Klaxon horn to take the place of the time-honored steam blast, though the idea is not a brand new one, strictly speaking. No less than 76 Klaxons are used for a similar purpose in a Newark, N. J., thread making factory, and 12 more are used by a packing company in Passaic, thus adding still another purpose to the long list already served by Klaxons, which have become fairly common as adjuncts to fire alarm systems in a number of manufacturing and private institutions.

The suggestion comes from abroad that radiator cooling fans might be provided with variable speed gears, so that on a very hot day or with a following wind the cooling effect might be increased by speeding up the fan. Whether the added complication is justified is another question.

Now a Step Ladder for Limousines.

Apparently permeated with a feeling of solicitude for the welfare of "luggage and tyres" and showing a reckless abandon regarding the amount of accessories that may be carried on a car, a British firm of supply dealers has brought out a folding step ladder described as having been "specially made for the safe conveyance of luggage or tyres to and from the roofs of motor car bodies." As it measures three feet in length, the price has been set at "three pounds ten," and it weighs only 18 pounds!

ENGINEERS ELECT AND DISCUSS MANY TOPICS

Marmon Formally Installed as President and Steps Taken to Commemorate Departed President—Progress Revealed by Standards Committee Reports—Subjects Discussed During Three Days of Winter Meeting.

Already high up in the world and climbing higher, the Society of Automobile Engineers last week reached an altitude record for itself when the annual winter meeting was held on the 24th floor of the Hotel McAlpin, in New York City. There can be no doubt, however, that as an engineering organization the society would climb even higher in importance to the automobile trade than it is at present, which fact is made very plain by the almost phenominal growth of the membership list; if the meetings served no other purpose, which is not true, they served to demonstrate that the society is growing, and growing fast.

Notable Increase in Membership.

During the past twelvemonth, the membership roll has grown from approximately 1,000 in December, 1911, to nearly 1,500 in December, 1912. Indicative of the real value of the work that has been done in the past and still is being done, and the natural manner in which engineers in every branch of the industry gravitate to the society with the minor and major problems which it is hoped to have solved by open discussion, upward of 400 members attended the sessions which were held January 16, 17 and 18.

Quite naturally, among the more important business that was transacted, the annual election of officers assumed a most important place, and though the mere nomination of men to fill the places of retiring officers always virtually has meant their election in the past, the counting of the mail vote at the first session nevertheless served to eradicate even slight feelings of suspense. The slate as nominated went through without a hitch, Howard Marmon, of the Nordyke & Marmon Co. of Indianapolis, Ind., becoming president; J. G. Perrin, chief engineer of the Lozier Motor Co. of Detroit, Mich., first vice-president, and Russell Huff, chief engineer of the Packard Motor Car Co., of Detroit, Mich., second vice-president. Coker Clarkson and Hermann F. Cuntz were retained as secretary and treasurer, respectively, quite as a matter of course.

Changes Made in Official Roster.

As members of the council, Joseph Anglada, E. F. Russell, of the Locomobile Co. of America, and Harold L. Pope, of the Pope Mfg. Co., replace Robert McAllister Lloyd, Henry May, Howard Marmon and Charles Ethan Davis, whose terms expire. The members of the council who "hold over" are: Charles B. Whittelsey, A. B. Cumner, A. L. Riker, Howard E. Coffin and Henry Souther. As president, Marmon succeeds H. W. Alden, who last August automatically became president with the death of Henry F. Donaldson; as vice-president Perrin succeeds Pope, who has been made a member of the council.

Propose Monument for Donaldson.

Under the head of new business, the only item which came up concerned the placing of a monument over the grave of past-President Donaldson. It was proposed and formally decided that the society finance the erection of a suitable stone properly lettered with the S. A. E. emblem in commemoration of Donaldson's services and in recognition of his personal worth.

As is usual, the professional sessions were well crowded with work, though in contrast to the summer meeting, when a number of papers were held over and none of the topics for discussion were discussed, everything on the program was carried out according to schedule, with the exception of four items—the fourth report of the Ball and Roller Bearings Division and the third report of the Frame Sections division of the Standards Commmittee, and the topics for discussion on magneto couplings and the "Relation of design to Construction in Motor Cars," the latter being considered too broad a subject for informal discussion.

Consider Reducing Number of Rims.

With the exception of one report—the report of Wheel Dimensions and Fastenings for Tires Division, by Wm. P. Kennedy—all reports were accepted, though in none of them are recommendations of a startling nature made. In view of the fact that there still exists great variety in opinion regarding just what standard types of rims should be advocated, and by reason of the expected disruption of the United Rim Association, which, as was pointed out by Chairman Souther, probably will result in the market being flooded with many new types of rims, it was decided not to accept the report until more definite conclusions could be reached, and as a result it was referred back for further consideration. Unfortunately, the subject of wire wheels, which was scheduled as a separate topic for discussion at the last minute, was included for discussion with the report on rims and fastenings, with the result that much was said about rims, and wire wheels were almost completely forgotten. With regard to rims, however, it was decided that there are at present too many sizes on the market, and in the belief that the number can be reduced very considerably to the mutual advantage of all concerned it was resolved that a commmittee be appointed to consider and report on the subject at the next meeting of the Standard Committee. The committee appointed consists of H. L. Barton of the Genera Motors Co., G. G. Behn of the Hudson Motor Car Co., C. E. Reddig of the Timken Detroit Axle Co., C. B. Williams of the Mott Wheel Works, J. G. Vincent of the Packard Motor Car Co., C. B. Whittelsey of the United States Rubber Co., H. E. State of the Goodyear Rubber Co., Henry Southern, consulting engineer of the Standard Roller Bearing Co.

Standards Committee Reports Progress.

Owing to the fact that the manufacture of broaches still is in a process of evolution, a really comprehensive report by the Broaches Division, headed by C. W. Spicer, was impossible, for which reason the report submitted, which is the third, was accepted as read with no discussion. The report is essentially a report of progress, and while no new data was submitted, a number of special considerations were brought up, among which the most important, as marking a step forward in manufacture, was the hobbing of splined shafts which now serves for machining.

The third report of the Miscellaneous Division, made by Chairman A. L. Riker, also was accepted as read, the most important portion of it consisting of a number of new magneto dimensions. In the second report, accepted at the last meeting, the height and length clearance required and also the additional clearance required were listed separately; in the new report they are combined. Similarly, the width dimensions have been simplified, the only

Digitized by Google

other alteration being the addition of a standard thread for the end of the magneto shaft. It is recommended that the shaft be ⅜ of an inch in diameter, and that it have a 16-pitch thread .5905 inches in length. The advance lever radius also was standardized at 2.125 inches.

The table of dimensions, as adopted, is as follows, the first nine items remaining unchanged:

Four and Six-Cylinder Magnetos

	MM.	Inches.
Shaft height	45.	1.771
Distance from center 2 front base-plate holes to large end of shaft taper	53.	2.086
Distance from center front base-plate holes to rear base-plate holes	50.	1.968
Distance from centers of base-plate holes left to right	50.	1.968
Large diameter	15.	.590
Small diameter	12.	.472
Length of taper	15.	.590
Taper 1:5 (included angle) 11° 30′ approx., Woodruff key No. 3.		
Height of magneto space	203.	8.000
Length of magneto space	254.	10.000
Width of magneto space	127.	5.000
Plain hole timing lever	6.35	.25

Tapped hole timing lever, ¼ inch, 28 pitch, S. A. E.

Base-plate holes, ⅜ inch, 16 pitch, U. S. F.

Thread for end of magneto shaft, ⅜ inch, 16 pitch, U. S. F.; length of thread, .5905.

Advance lever radius, 2.125 inches.

The report of the Sheet Metals Division, which is the fourth, also was essentially a progress report and was accepted as such. In rendering the report, Chairman T. V. Buckwalter advocated very strongly that efforts be made to standardize sheet metal gauges. During the interim between the last meeting and the present one, letters have been addressed to all members of the trade using sheet metals and rods, with a view to determining what sizes they use, and until all have been heard from it has not been found advisable to recommend any standard sizes. It is hoped, however, that by the next summer meeting, sufficient data will be in hand to permit the submission of a comprehensive report upon which recommendations for standardization can be made.

Although the division on motor testing which was created at the summer meeting with John O. Heinze as its chairman, has been in existence but a short time, its activities have been most marked, and though the work has not progressed far enough to warrant the recommendation of any standard method of testing motors, the report as read was none the less interesting, as indicating the real necessity for some such standardization. In the report, Heinze included a number of very large diagrams and proposed forms of horsepower curves suggested for use. There was little discussion on the report, however. The second report of the Nomenclature Division (chairman, E. J. Stoddard) was another that was essentially a progress report, which was rendered verbally and therefore elicited very little discussion. The third report of the Springs Division (chairman, Harold L. Pope), in which dimensions and designations for springs are recommended, already has been printed in the proceedings of the society, and it only remained for it to tbe formally accepted. It was read by title and no discussion preceded its acceptance.

Two New Bronzes Recommended.

In the third report of the Aluminum and Copper Alloys Division, submitted by Chairman Wm. H. Barr, and accepted with scarcely any discussion, two new bronzes are recommended—the first, consisting of 87 to 89 per cent. copper, 9.5 to 10.5 per cent. tin and 1.5 to 2.5 per cent. manganese, being suitable for valves and light gears, and the other, consisting of 88 to 89 per cent. copper, 11 to 12 per cent. tin and 0.15 to 0.30 per cent. phosphorus, being suitable for gear bronze, the alloy being similar to English gear bronze.

In reading the report of the Truck Standards Committee, which was accepted as read and was essentially a progress report, Chairman Wm. P. Kennedy drew attention to the fact that because not all manufacturers had replied to a set of printed questions submitted to them, it was impossible to render a really comprehensive report. No standards are as yet ready for recommendation, the committee, as outlined in the report, being at present engaged in determining a number of the more important points for standardization, such as the most suitable size of motor for the load and the proper sizes of tires with regard to the load.

Gasolene Comes In for Attention.

It was not until Thursday morning that business had reached the point where the reading of the set papers was in order. The session was styled a "commercial vehicle session," and all of the subjects treated had to do directly with trucks. Cornelius T. Myers read the first paper, entitled "Comparative Data on Performance of Motor Trucks with Regard to Size of Motor and Gear Ratios," which consisted essentially of a number of performances and cost charts. It was followed by a paper, "Low-Grade Fuel for Motor Trucks," by N. B. Pope. In drawing attention to the necessity for an alternate fuel, Pope suggested that "there is good reason to hope that the fuel difficulty may be relieved in a large degree by co-operation between the automobile maker and the refiner, though the result of such co-operation cannot under the circumstances be realized for a period of months, possibly of several years." He further made the obvious, though nevertheless seldom thought of, point that "as a large proportion of commercial vehicle types may be said more truly to be in the early stages of evolution than are pleasure vehicles, it follows that the adaptation of special apparatus for handling low-grade fuels will work less hardship on the truck manufacturer than it would if forced on the builder of established types of pleasure vehicle. Further, the higher valuation placed on operating economy by the commercial vehicle purchaser must tend to render the kerosene- or naphtha-burning machine a more acceptable offering in that field than a pleasure car possessing the same feature would be in its field. Indeed, were it possible to offer almost any large truck user a carburetter that would handle a low-grade fuel as efficiently as his present carburetter handles gasolene, there is little question that he would accept the substitute immediately, on the basis of a not unreasonable performance guarantee."

Resume of Foreign Tendencies.

Very little discussion followed the reading of a paper entitled "Foreign Tendency of Motor Truck Design," presented by L. C. Freeman. "A composite picture of the predominant English motor trucks," he said in substance, and in leading up to a more critical survey of the "high spots" of foreign design, "would show the motor under a hood in front of the seat; right-hand drive; fixed spark magneto ignition; thermo-syphon cooling; three-speed transmission; cast steel plain-bearing wheels; rear springs taking both drive and torque; both brakes on rear wheels, and worm, pinion or chain final drive."

Later, he drew attention to the fact that the worm drive has a shade the better of the argument in England at present, but is not gaining ground very rapidly, while in France it is not yet considered seriously. Owing to the length of a paper by B. B. Bachman, entitled "Comparative Results with Solid and Pneumatic Tires on Light Commercial Vehicles," only extracts of it were read and very little that is not already known was brought out in the discussion.

Pierce-Arrow Man Defends Worm Gear.

Thursday evening's session was rounded out by informal discussions on "Worm Gears," "Motor Starters for Commercial Vehicles" and "Metal Wheels," though none of the discussion was productive of information really enlightening, in view of what already is known. As usual, David Ferguson, of the Pierce-Arrow company, had much to say in their defense. Strangely enough, the second subject elicited very little discussion, the concensus of opinion being that, despite apparent advantages, it was

Digitized by Google

not advantageous after all to equip commercial vehicles with engine starters, the greater complication being the excuse that found most ready and most frequent use. Nor did the subject of metal wheels give rise to a great amount of argument, it being held by nearly all of those who spoke that the metal wheel undoubtedly has advantages but that the advantages are confined to its use for particular purposes.

Wilkinson Delves Into Formulæ.

All of Friday morning was taken up by the reading of four papers that were held over from the summer meeting, the first three of which, "Stability of Automobile Propeller Shafts," by J. M. Thomas, "Leaf Springs," by L. J. Lane, and "Method of Brake Capacity Determination," by S. I. Fekete, were published in Motor World in connection with the report of the summer meeting. The fourth, "Effect of Relation of Bore to Stroke in Automobile Engines," by John Wilkinson, was inordinately long and replete with abstract formulas and so highly technical as to be of interest chiefly to those intimately concerned with engineering practices; it elicited scarcely any discussion.

The paper on "Exhaust Gas Analysis," by Dr. Arthur H. Eliott, which headed the list for the afternoon session, and which dealt primarily with the determination of efficiency by means of analyzing the exhaust products, caused considerable discussion from Herbert Chase, E. R. Hewitt and Professor W. C. Marshall, the concensus of opinion being that the importance attached to the method outlined was not warranted by the results obtained, and that great reliance could not be placed upon it. The subject was one which dovetailed fairly well with the scheduled topic for discussion on the "Relation of Road Testing to Dynamometer Testing," and hence these two were merged. E. R. Hewitt opened the discussion and was followed by Professor Marshall, who laid great stress upon the value of the accelerator as a testing instrument, which, he said, was not generally realized.

Anent Carburation and Balance.

In a very short paper entitled "Motor Testing," which covered in a general way points which have been observed under specific testing conditions in one laboratory, Charles P. Grimes brought out the interesting fact that carburation may have a very decided effect on the running balance of a motor, a case in point being a long-stroke L-head motor which, equipped with a stock carburetter, vibrated badly at 22 miles an hour; by changing the carburetter the point of vibration was reduced almost entirely and was scarcely appreciable at 32 miles an hour.

Of the several topics for discussion on Friday evening and Saturday morning, none proved productive of greater discussion than the question: "Will the six-cylinder motor eventually displace the four for pleasure cars?" The concensus of opinion was that the four-cylinder motor never would be eliminated, the discusion being opened by J. O. Heinze, who stated that, while it is possible by fitting a much heavier flywheel to a four-cylinder motor to obtain the smoothness of operation of a "six," the smoothness is obtained at the expense of accelerative powers which are indispensaole if the "four" is to have flexibility. The "four," he further pointed out, is superior in efficiency to the "six" and, if for no other reason, is bound to be continued in order to supply the demand for a machine that can be operated at comparatively low expense.

Much the same opinion was held by Howard Marmon, who caused laughter by stating that the use of the word "pleasure" in connection with a car generally is a misnomer, in view of the fact that the average pleasure car seldom is used for pleasure alone. Where it is used for pleasure alone, as for touring, and not for town service, the "six" represents real luxury, but as long as cars are used for both pleasure and work, as represented by town service, which demands low upkeep cost as compared with the upkeep cost of a comparatively heavy "six," the "four" must survive. As regards the use of six-cylinder motors in trucks, the opinion prevailed that their efficiency is not great enough and that, as there is less demand for flexibility and lack of vibration, the four-cylinder motor amply fulfills all demands.

Elimination of Magneto Improbable.

In response to the question "With the motor starter, lighting plant and ignition possible in one unit, will the magneto be discarded?" the concensus of opinion as revealed by the discussion was that the magneto is an excellent device for its purpose and that it is not likely to be discarded for a long time to come. Speaking in favor of the elimination of the magneto, Harold L. Pope ventured the opinion that it eventually would be found possible to combine lighting, starting and ignition with proper efficiency for each function and that before very long some such system must be evolved.

Of the other two topics remaining, the discussion provoked by the question "Is the transmission located preferably on the rear axle, as a separate unit, or combined as a unit with the power plant?" was the more voluble. Howard Marmon summed up in defence of the rear axle position by stating that it permitted greater accessibility, reduced the strain on universal joints, thereby conducing to greater life, permitted the use of a "springy" propeller shaft, thus cushioning the shock of the gears and, contrary to expectation, added only about 5 per cent. to the weight unsprung on the axle. As against this, it was pointed out by others, among whom were Prof. Hutton, that the rear axle position is the dirtiest position on the car and that as a result there was grave danger of abrasive material getting into the gear case and causing damage. Greater accessibility also was claimed for the gearset combined in a unit with the engine, and altogether opinion was very evenly divided as to which of the three locations is the best. The remaining topic—"Why has the 42-inch wheel been discarded?"—brought out very little discussion, the concensus of opinion being that its greater expense, both for wheels and for tires, was not offset by the smoother operation and easier riding generally credited to it.

Truck Men Breakfast and Discuss.

Combining a measure of business with a much larger measure of pleasure, the Motor Truck Club of New York City, on Tuesday morning "breakfasted" its members and some who are not members but whose prominence in the trade gives them the entree to all such functions, at George Rector's hostelry, the club's own headquarters. By reason of the fact that many of those invited are taking active part in the commercial vehicle exhibits in Madison Square Garden and Grand Central Palace, the "spread" was served in the morning between the hours of 10 and 12, and the wisdom of those in charge in choosing such an unusual time for a banquet, if it may be termed such, was reflected in the attendance; upward of 300 persons were ranged about the tables.

Quite naturally, President D. C. Fenner made the opening address, and after reviewing the aims and ideals of the club, gave way to F. F. Beal, of the Packard Motor Car Co., who presented a paper on "Production." The other papers and addresses that served to inject a slight business-like flavor into the proceedings were: "Advertising and Selling," by P. D. Wagoner, president of the General Vehicle Co.; "Operating Motor Trucks," by Elisha Flagg, Jr., general manager of maintenance for the American Express Co.; "Motor Truck Service," by George H. Duck, of the American Locomotive Co.; "Past—Present—Future," by Walter Wardrop.

Bauer Quits Cars for Accessories.

Frank Bauer, until recently connected with the Oakland Motor Car Co.'s purchasing department, has acquired an interest in the Durable Co. of Detroit, of which he has become president. The company manufactures leather automobile accessories.

OLD CARS THAT CUT PROFITS

How One Big Company Prevents Loss by Providing Penalties—Advertising Value of Actions Made Plain.

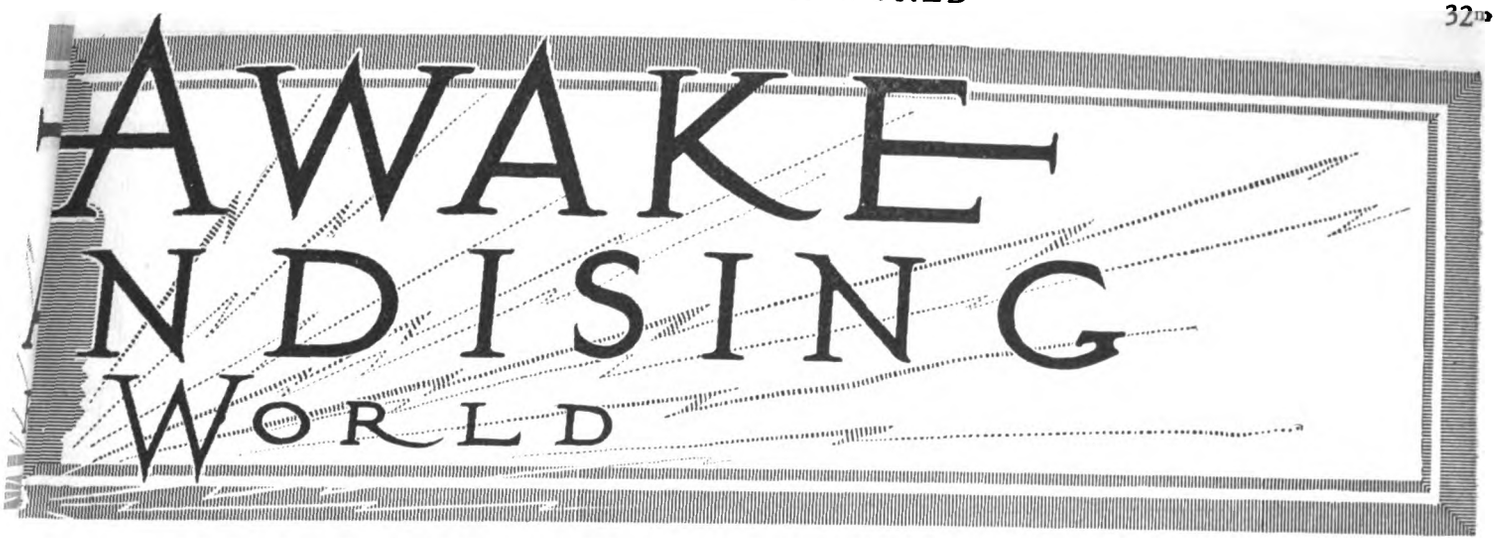
It may have been all right for the "shoemaker's children to go unshod" in the old days, but in this day and age it is regarded not simply as poor business for the shoemaker but as very bad business for everybody concerned. And there is not a great need to enter into a prolonged discussion in order to point out the reasons why. It is fairly well established that this is an age of advertising, and it is recognized that whether one likes or not, everything he does advertises him favorably or otherwise. Nevertheless, the sight of a dealer driving a last season's or a two-year-old car of a make he has long since discontinued the sale of, may well make the observant ponder, even to the extent of wondering if his dealer's faith in the products he used to sell is not greater than that which he has in eye on" the automobile dealer, at least so far as what he drives is concerned, and this suggests two things, both of which are recognized in a recent circular of instruction issued to branch managers of the Studebaker Corporation: First, the paramount importance of the dealer driving and demonstrating with the very latest model. Second, that the car driven shall be kept polished and spotless and tuned up to the very highest pitch mechanically—not sometimes, or occasionally, but all the time.

Old Cars That Cause Trouble.

So vital does the Studebaker Corporation estimate these two points that it is made a misdemeanor for a branch manager to drive anything but an up-to-date model and to drive or send out for a prospect, dealer or otherwise a car that is not spotlessly clean.

All this is in the line of good merchandising and good advertising, equally applicable to dealers in all lines of cars.

"CASHING IN" ON THE SHOWS.



show printed matter and enough of it to cover their mailing lists; it should be imprinted with the dealer's name and address, and then mailed it to all prospects.

Don't expect marvelous results; but mail it, nevertheless. Send it under two-cent postage, if necessary. It probably cost the manufacturer several times what you will pay for postage and, if he furnishes it to you without cost you can well afford to mail it to your prospects at your expense. Try it for what it is worth.

QUALITIES THAT SELL GOODS.

Selling automobiles is not essentially different from selling any other specialty. Some of the things that count are knowledge of the goods, study of the customer and his needs, energy, persistency, tact, honesty, confidence, earnestness, enthusiasm and work. When a man cultivates and employs all these qualities, results are bound to tell a satisfactory story—satisfactory because represented by dollars and cents on the credit side of the ledger instead of on the debit side.

EFFECTIVE WINDOW DISPLAY

Three Principal Requirements, But of Themselves They Will Not Achieve Results—Other Things Necessary.

Window displays to-day are receiving attention from automobile accessory manufacturers who are just opening their eyes to the wealth of opportunities to be seized and utilized through attractive window displays. This means that the accessory dealer will do well to take time by the forelock and study the window display question scientifically.

Experience has demonstrated that first of all a window should be of convenient shape and size; second, it should be well lighted; third, it should be kept clean. When all three of the ideal conditions named obtain, the merchant still has only the stage on which the selling play must be built.

Speaking Parts Played by Signs.

He then must people the stage with goods —and, to carry the metaphor still further, there must be speaking parts played by neat signs that will carry the message to the minds of all who pause to look.

Department stores regard their window trims as important assets. So do the live merchants in every other line. The opportunity for the dealer in accessories is just as great. Drawing from the experience of his brother merchants, he will cut down the variety of goods displayed and will time his displays to the season.

On wet, slushy, slippery days non-skid tires, anti-skid chains and other seasonable devices should have the floor. It is the psychological moment. On cold days, anti-freezing devices, hand warmers, carburetter heaters, priming cans and the like will be shown. On hot, tire trouble days, tire patches, cement, vulcanizers, etc., will be in evidence, and so on, adapting the display to the season with a view of having it timely at all seasons.

The idea of the best window trimmers is strength gained through simplicity and neatness. One thing at a time, or several things that relate intimately to each other—but never a group of too many things.

Value of Simplicity in Dressing.

Where forty or fifty different objects vie with each other for attention, it resembles nothing so much as that many people trying to speak at once. Each knows what he wants to say, but the hearers are bound to be in doubt.

The principle of confining displays to a limited range of goods is so well established in other lines as to hardly seem to require emphasis. But the fact is that window displays are only beginning to receive careful consideration from accessory dealers, and there is still much to be learned. Now is the time to learn it.

MIXING AUTOMOBILE ACCESSORIES WITH OTHER GOODS.

Tuttle & Clark, Jefferson avenue, Detroit, were until a few years ago dealers in horse goods. They carried fine harnesses and everything else that belonged to an exclusively high grade horse-goods business. The popularity of the motor car naturally put a very perceptible crimp in their trade. But, instead of bemoaning their fate, they got busy and adjusted themselves to the new conditions. First, they put in a carefully selected stock of what goods they knew fitted into their lines, and, by the way, they have been adding to the length, width and depth variety of this stock ever since. Then they got out a catalog covering these goods, a copy of which was sent to every registered automobilist in Michigan.

Things began to come their way almost immediately, for it soon became noised abroad that this store was catering to motorists in an aggressive fashion. All sorts of leather goods, automobile trunks, caps, goggles, motorists' wearing apparel, chauffeurs' outfits, lap robes, picnic basket equipment, etc., were featured, and many odds and ends were picked up abroad that could be had nowhere in Detroit.

Once the trade started coming the firm laid themselves out to take care of it. And they are continually stirring up things throughout the year.

Worth of Saturday Bargain Sales.

Every Saturday is a special bargain day with Tuttle & Clark. Special prices are quoted just for that day on standard goods. The idea is to get acquainted. The advertisements are usually of moderate size, but well displayed, with prices set large, and plenty of illustrations. The goods featured are unusually seasonable and the ads run in the Friday evening and Saturday morning papers. No effort is made to create sensational ads, but emphasis is laid on the particular values offered. Originally starting as a means of introducing their automobile and motoring lines of goods, these Saturday bargain days have become a pronounced feature of the business looked for each week by the motoring public. Needless to say, they have not only proved profitable for Tuttle & Clark, but have been the means of moving stocks fast and keeping them up-to-date.

Their efforts to reach the automobile public have not, however, been confined to the newspapers. Backing up their handsome catalog, they use special folders in the spring, during midsummer, fall, and at Christmas time. The predominant features of the folders are good paper, fine cuts, accurate, unvarnished descriptions, net prices, well selected goods and attractive use of color printing. Their list of motorists is kept up-to-date, and much of the advertising matter is mailed under one-cent postage. They count on the attractiveness of their printed matter getting it the attention they seek. And they are not disappointed.

Solutions of The Used Car Problem, in Competition for Motor World's Cash Premiums of $50, $25, $15, and $10 for the Best Four Articles Dealing With the Subject.

By W. H. HUNT, Chicago, Ill.

The spectre of a floor full of second-hand cars upon which an absurd valuation has been allowed in order to make sales of new models, is keeping many a sales manager awake nights and adding years to the age of the small town dealer.

The sales manager of the big branch house is required by "the powers that be" to show a profit on this class of business, if possible, or at the very least an even break. The small dealer is compelled to realize some profit or explain why to his local banker. This is the condition, but the market for used cars seems to be a sealed vault into which it is impossible to break. There seems to be an intangible, unanalyzable something; a force that cannot be classified or overcome, keeping the dealers out of a branch of the business that is essential to their existence.

What is this force? How has the dealer been placed in this position,

To the man who has followed the course of automobile events for a few years the answer to these questions is easy. It is lack of confidence.

Let us delve into ancient history for a short while.

In the beginning the rural buyer was very like a sponge and would absorb almost anything offered. He was a trusting soul very much given to the acquisition of "gold bricks," "acrobatic buildings" and other bric-a-brac of like value, among which were automobiles that were a godsend to the newspaper funny man but a never-ending source of horror to the poor misguided individual who tried to make them live up to the designers' expectations. Nobody will ever know how many of these poor souls have acquired the habit of sleeping under the bed with a "buffalo wrench" in one hand and a screw driver in the other.

The cars that were palmed off onto this class of buyers were the ones that the dealer had taken possession of with a smile and disposed of with a positive chortle. These machines were well nigh impossible to sell in any other way than with "sight draft attached to B/L."

But to resume our story. To be sure our rural friend had the privilege of examining a perfectly beautiful fifteen dollar coat of paint and an immaculate thirty dollar set of tires without more than two sections set into any one shoe. To be sure he had the opportunity to use an experience in things pertaining to the automobile that he had never had the opportunity to gain. But what good did the opportunity do him without the knowledge? If his native caution warned him to refuse delivery he, of course, lost only a small matter of twenty-five or thirty dollars which he had deposited to cover "freight charges one way." But if, in his trustfulness, he accepted the car he paid to his local bank the amount of the draft (which, by the way, was never drawn for more than two hundred per cent. of what the car could have been bought for at the point of shipment), and forthwith began his automobile education, which was liberal in every acceptance sense of the word. He learned that the car he had bought was a lemon, and that it would serve as a warning to their neighbors and friends among whom they are a laughing stock.

It is these farmers and their sceptical neighbors whom the dealers, all over the country, are depending upon to absorb the used cars as rapidly as they are offered.

But the "burnt child shuns the fire," and the second-hand car buyer who has been "stung" turns pale and thinks of the mortgage every time he hears a "burred gear" or a tire "blow out."

I think that I have made my case clear. You, dealers, have killed the "goose that laid the golden eggs." You have killed the confidence of the class that you depend upon to relieve the pressure. The question now is, Can that confidence be revived? It can. But it is going to be a long, tedious process. It can be restored by only a long, careful nursing of the second-hand car market. And what is to become in the meantime of the house that is filled to overflowing with old models?

Ernest Warner of Wakefield, Ill., proposed a remedy in the November 28th issue of Motor World. He suggested that the dealers of each State get together and appoint a sort of an inspector to pass upon the condition of each used car offered for sale in his territory, and also place a fair value upon it. So far, good. But will the dealers voluntarily remedy defects as the inspector finds them? Will they handle the cars at the valuation the inspector places upon them? How about favoritism? Will the inspector place the same low valuation on the "good fellow's" car that he will upon the car belonging to the "grouch"? Furthermore, an inspection bureau, such as outlined, is going to cost considerable in salaries and railroad fares for the inspectors. That one man can do the work nobody can believe.

Finally, there has been established, in the city of Chicago, just such an inspection bureau as Mr. Warner has outlined. This concern works without cost to the dealers, as it takes its compensation from the buyers only. It renders to the buyer a very complete, exhaustive report, covering the mechanical condition of any car the buyer may select.

The seller of the car is given every opportunity to remedy defects in his car before the report is delivered to the customer. If he is honest in his dealing he is ready and eager to take advantage of the opportunity. However, if the car is in bad condition and the dealer is indifferent to the best interests of his customer, he should and does meet with obstacles to the consummation of the sale of that particular car. The result of this work will be that this latter class of dealers and their worthless cars will soon be eliminated from the field. Then, and then only, will the customer who wants to buy a used car but is afraid regain his confidence in the honest dealer and begin to relieve the tension in the used car market.

We, in the trade, know that there are many wonderful values to be had in used cars. But we also know that for

REILLY AROUSED TO VALUE OF ACCESSORIES

Exhibit at Automobile Show Gives Realization of Profits Possible to be Gained by Dealer in Cars—Resolves to Enlarge His Business When He Gets Home—Discusses Plans with Sales Manager.

After having made several changes of his overcoat from his arm to his back, Reilly, who was beginning to feel warm again, took off his overcoat for the fourth time, but he had it off not more than ten minutes when one of those mysterious draughts which are characteristic of Madison Square Garden hit him in the back of the neck and on went the coat; he was inclined to be miserable, because he had gone without a comforting after-dinner smoke in order to hurry to the Garden, the smoke being dispensed with because such pleasure is forbidden in that metropolitan institution which operates under the name of subway but which in principle is very much like an up-State cannery.

Reilly Develops Foot Weariness.

At the Garden he thoughtlessly lighted a cigar and prepared to enjoy himself in a ramble among the cars and accessories, but had progressed not more than three spaces and a half when a red-coated six-footer said "No smoking, please," and away went 12 cents' worth of good Connecticut Havana. After a perusal of a long row of accessory exhibits he arrived at a cluster of seats which resembled a lost section of a theater, and having a typical case of automobile show foot-weariness the dealer dropped into one; from this vantage point he could get a glimpse of the press room and occasionally got a whiff of the atmosphere from this sanctum, when some entrant pushed aside a section as he entered, for, while smoking is forbidden in the Garden, this is one place where everyone smokes and smokes anything. Even second-hand — or "used"—smoke was comforting.

Impressions Gained from the Display.

Reilly was surveying the cars and bright lights with the air of a blase first-nighter, when his repose was interrupted by a query from beside him: "Well, outside of the fact that you're hot one minute and cold the next and have sore feet and can't smoke and have seen so many cars that they all look alike, how do you like the show?"

"Huh!" exclaimed Reilly with a start, as he turned to see who was addressing him. The Sales Manager stood there smiling. "Oh, hello, Jim!" greeted Reilly. "Great show, isn't it?"

"Glad you came?" questioned the Sales Manager.

"I certainly am; I wouldn't miss it for anything," was the answer. "The business certainly is coming along all right, isn't it? A man would have to be pretty much of a kicker to find fault with almost any of the cars this year. He sure gets his money's worth—starters, lighting systems and equipment galore."

"The accessories certainly are a tempting

A RED-COATED SIX-FOOTER SAID "NO SMOKING, PLEASE"

lot, for one thing, aren't they?" asserted the Sales Manager, as he extended his hand toward the row of exhibiting spaces where was visible a host of devices designed to make the car owner comfortable and happy —also to assist him in keeping the accessory makers and dealers happy.

"Do you know, Jim," stated Reilly, "the accessories have impressed me this year as never before; I am just beginning to wake up to the real meaning of all this stuff that is shown here. I always have believed there was money in accessories and such stuff for a dealer in cars, but I don't think one of us out of twenty is getting anywhere near what he should from that business."

Decides to Stock More Accessories.

"What are you going to do? Give up cars and turn accessory dealer?" asked the Sales Manager.

"No, not that," explained the dealer, "but I'm going to make some money out of accessories. How many things are there here that a car dealer could sell to his customers if he only had a stock and pushed it? I have carried tires, horns, hood covers, spark plugs and a stock of actual necessities, but I'm going after more business; I know it can be done from the way my limited stock has moved.

"The accessory makers are turning out new things right along, and many of them have real merit; of course, a great many of the new devices add too much complication or have other undesirable features, but there are a lot of them that would sell if the car owner had them brought to his attention. Most owners are able and willing to pay for comfort and convenience and would never hesitate at spending the small amount for which the average accessory calls."

Enumerates Some Popular Devices.

"What are you going to do—stock all of them? If not, where are you going to draw the line?" asked the Sales Manager.

"As to drawing the line, that will have to be a question of personal judgment," said Reilly, "and I am not going to stock everything that's made. But just take one instance, as an illustration; how many owners like to work hard pumping up a tire? You don't need to answer; the man who drives a car would almost rather tow it home than pump up a big, heavy tire. As to pumps, some of them are attached to the motor and are expensive and come more as manufacturers' equipment; but I ran across one to-night that sells for a reasonable price and ought to make a good seller for a dealer. It's a spark plug pump that is attached and taken off by a turn of the wrist, which is much easier than working a hand pump, as you will admit if you ever pumped up a big tire.

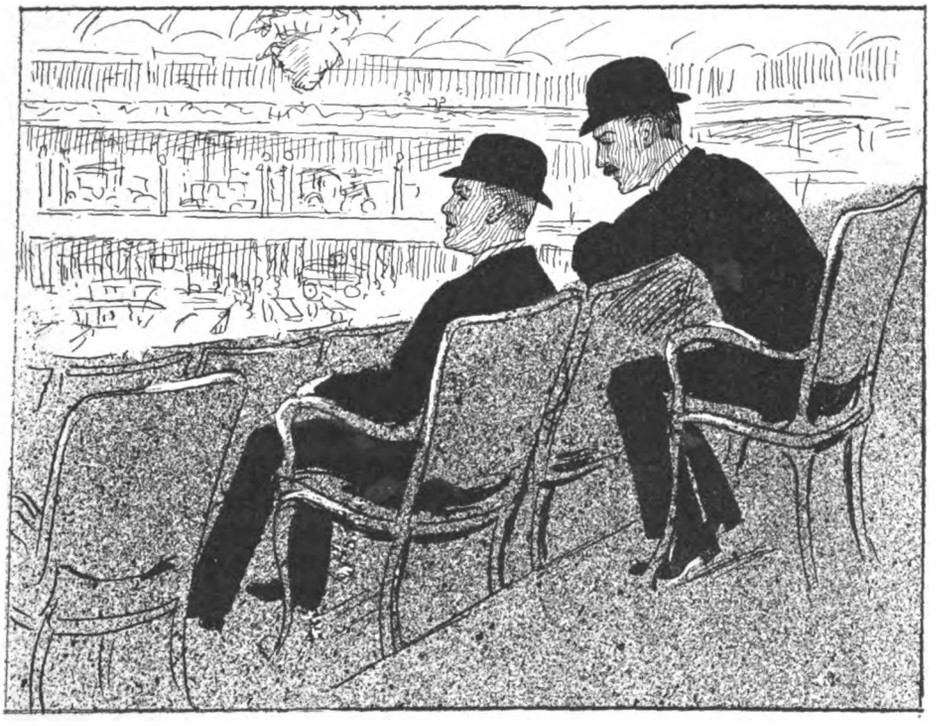
Old Idea But of Greater Growth.

"These things that have impressed me are not necessarily new, but the idea has assumed new proportions to me; once the idea began to grow it seemed as if everything I saw looked good, and I have gotten more out of the accessory show than I ever did before. I have seen a whole armful of compact little tool kits, socket

Digitized by Google

wrench outfits and so on, and there are many owners who would buy those things. But the whole idea centers around the one fact that while owners may not be buying all this stuff now they would buy more of it if they had it pushed out in front of them and its advantages emphasized.

Sales Manager Tries Out New Things.



"I dont' want to encroach on your trade," confessed the Sales Manager, "but I might as well tell you that on the sly I made a dicker with some of these accessory people to-night to send me on some of their devices for my own car. They didn't give them to me, either; I paid for them, and I'm going to use them myself."

a car. All of them fell in with my little scheme of getting hood covers this fall when the weather began to get cold, and I have sold a big order of that one line in my town; it wasn't hard, either."

"Don't you think it might hurt your other business?" asked the Sales Manager, more to keep up his end of the conversation than because he believed there was necessity for the question.

Proper Display Necessary Feature.

"I don't see how," was the response. "Accessories can be a very profitable side line. The scheme as I have framed it thus far in my mind its to get the display of goods in such a place that every man who comes into

"I'M GOING TO MAKE MORE MONEY OUT OF ACCESSORIES"

lic realize the comfort and convenience of the telephone. Just the same way, all these owners who have their cars with the equipment put on by the manufacturer can be educated to the point where nothing is too good for them; in fact, they're at that point to-day. All that is needed is for the dealer to push the goods.

"When you stop and think it over, Jim, there is a big point in the way manufacturers have taken to equipping their cars; they have only served to whet the car owner's appetite for more equipment. A few years ago an owner was satisfied to pay for his car and then buy what accessories he needed; but by the insistent demand he made for more equipment on his car he has brought the manufacturer to the point where he is adding a wealth of things to what used to pass under the name of car. But owners haven't changed so very much, despite this equipment, and the majority of them are willing to buy extra stuff if they feel they need it. The dealer's part is to make them feel they need it. The whole proposition is simply that the accessory dealer always will be one step ahead of the car manufacturer in offering equipment. And not only will he sell goods that do not come with the completed car, but there always is a market for replacing accessories that have given out in service."

Made Some Profit But Wants More.

"I always thought you claimed you were making something out of accessories," chided the Sales Manager.

"I did claim to," admitted Reilly, "but I make the claim right now that I'm going to make more out of them; this show has served as quite an awakener to me—also. I'm afraid it will put me on the bum. If I've put this overcoat on and taken it off once I'll bet I've done it twenty times.

CARE AND REPAIR OF LIGHTERS AND STARTERS

What to Do When the Lights Grow Dim or the Starter Refuses to Start—Normal and Abnormal Conditions Explained in a Manner to Make Them Plain to All—Disco Electric System Dissected.

(This is the sixteenth of a series of articles designed to make clear the electric lighting and engine-starting systems in use and to render easier their care and repair by the dealer and owner alike.)

The engineer on an ocean liner quite naturally takes justifiable pride in the machinery under his care; clean metal, smooth-running bearings and rhythmic motion appeals even to the passengers, and the "pit," where the giant engines throb, is a veritable theater; the steady beat of the "heart" has a fascination that is undeniable.

To the engineer, the gentle vibration, the pleasure out of the work. And in this connection, it is doubtful if a piece of mechanism can be found that is more interesting and more instructive and responsive to care than is the electric lighting and engine starting system. It is comparatively simple, as has more than once been remarked in the fifteen previous issues of Motor World which contain a series of articles on the care and repair of such systems, it is instructive, and its intelligent care by the owner or by the dealer will pay unexpected dividends not only in the greater satisfaction gained but in actual money saved for repairs and adjustments.

SKELETONIZED VIEW OF DISCO DYNAMO AND STARTER, SHOWING INTERNAL CONSTRUCTION OF EACH

ceaseless journeyings of the piston rods up and down their slippery slides and the continual murmur of the journals is the music that sings "all's well." His trained ear catches in an instant the slightest falter or the faintest of "different" sounds. Of course, the engineer is paid a good, fat salary to be eternally vigilant—to watch over his engines as a mother watches over her child. Constant association breeds familiarity that never for an instant is permitted to degenerate into contempt. From a duty, his work soon becomes a pleasure that is all the more absorbing because it provides his sustenance. He is proud to keep his machinery spic and span, and the erstwhile prime reason for keeping it "just so" as a preventive of future trouble soon becomes an ulterior one.

Simplicity of Electric Systems.

Actually, there is no reason why the owner of an automobile should not take just such care of his car and get just as much real

Long Study Is Not a Requisite.

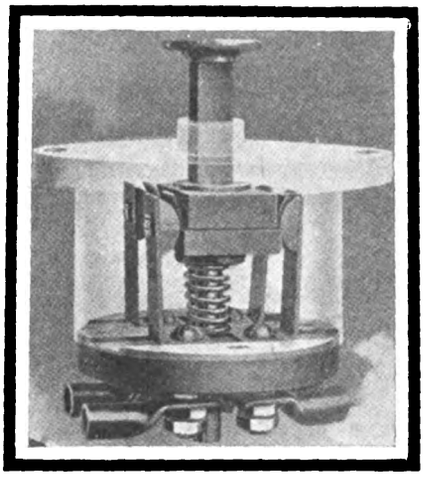
To continue the analogy, the engineer on a liner is required to spend a long term of years learning thoroughly all about the mechanism which eventually will be placed in his charge. After he has acquired the theoretical knowledge, several years must be spent in acquiring practical knowledge, and then he must pass a rigid examination to determine his fitness to doctor and generally care for the machinery. It is not so with the automobile owner, of course. He need know little or nothing about the mechanism, as far as other than himself is concerned; there is none to dispute his right to operate his car, provided he has the necessary wherewithal to pay for its purchase. The cars themselves are simple, and it has followed quite as a matter of course that their accessories have been simplified, and in the simplifying process it goes without saying that the electric lighting and engine starting system has received its full measure of treatment.

As is the case with very nearly every other part of a car, to simplify means in a large measure to make more accessible, which is indicated by the general clearing away of unnecessary parts. Fortunately, the location of an electric lighting and engine starting system presents few difficulties that cannot be overcome without sacrificing accessibility. Both generators and motors are comparatively small, and generators in particular can be placed almost anywhere on the chassis where a convenient rotating shaft is available. The pump or magneto shaft is the favorite position, for it affords a ready means of transmitting the necessary power and at the same time ensures a perfectly accessible dynamo position. Often, however, the location of the dynamo in this position necessitates alterations of greater or lesser magniture in the design of the engine to permit of its proper mounting, and even though such alterations scarcely can be expected to affect the efficiency of the engine, they may increase production cost slightly. It was with these points in view that the Disco

Digitized by Google

electric lighting and engine starting system was designed. It is produced by the Ignition Starter Co. of Detroit, Mich., one of the pioneer producers of acetylene engine starters.

Narrowness Permits Easy Mounting.



The Disco system is of the two-unit type, in which the generator and the dynamo are separate, the theory behind the design being that the temporary derangement of one unit need have no effect on the other which will prevent its use until the other has been repaired or adjusted, as the case may be. The system is chiefly distinctive by reason of the unusual shape of both the generator and the motor.

In order to permit their easy mounting in almost any position on the motor or the chassis, both have been made exceptionally narrow, as may be seen by the accompanying pictures. The extreme narrowness of the generator in particular makes it a very simple matter to mount it on the engine to be driven by the straight-through shaft that drives the magneto or the pump. Similarly, the motor also may be mounted at the side of the engine, without increasing the overall dimensions of the machinery under the hood and without making necessary any alterations in engine design. Owing to the shape and compactness of the motor, comparatively wide latitude for choice in the selection of a means of gearing it to the engine is afforded; it may be connected either through gearing cut in the periphery of the flywheel after the manner that has become fairly common, or it may drive through the intermediary of a "silent" chain to the crankshaft, the interposition of a roller clutch in either case effectually preventing possible damage through back fires.

Dustproof, Yet Accessible.

The mere fact that both the motor and the generator are accessible naturally reduces to the minimum the already small amount of work necessary in caring for

necessity for positive regulation of the output with the minimum of complication. Consequently, regulation has been made an inherent feature of the machine and is obtained automatically and electrically without the use of external mechanical or electrical devices. It is obtained in the winding and the shape of the pole pieces, the characteristics being that the current produced at seven miles an hour is sufficient to commence charging the battery; at 15 miles an hour, sufficient current is produced to charge the battery and also to carry the lamp load; the maximum capacity of the generator is reached at about 20 to 22 miles an hour, when the output remains constant until a speed of about 35 miles an hour is attained, when the output curve drops gradually. Hence, the generator charges the battery continually, though by reason of its self-regulating feature no harm can come to the battery, which, instead, is benefited.

DISCO STARTER SWITCH

Where Attention Is Necessary.

The generator is connected to the battery by and through the action of a magnetic cut-out of orthodox pattern and simple construction, the function of which is to connect the dynamo to the battery when the

tinuous service for a long period, they may be cleaned with fine emery cloth, though great care should be taken to see that the two faces are exactly parallel when the cleaning operation is completed, and that the adjustment has not been disturbed.

Excessive Lubrication Detrimental.

The motor in the Disco system is of the plain series wound type in which the torque increases with the load up to certain limits which it is virtually impossible to exceed. It is constructed to carry heavy currents without heating, as may be judged by the diameter of the field wiring apparent in the accompanying picture. Like the generator, the motor is completely enclosed, though its mechanism is accessible merely by removing the end plate over the brushes. Owing to the fact that it is used infrequently and then for only a few seconds at a time, it seldom will require to be touched, though it will do more good than harm occasionally to open the casing and carefully remove any accumulations of carbon or road dust that may have collected. Under no circumstances should the amount of lubricant specified by the manufacturer be exceeded; the temptation to use an oil-can frequently must be curbed , for little lubricant is required, and if too much is applied it will collect on the brushes and commutator and cause trouble. A few drops of fine machine oil placed in the oil holes about once a month should suffice, unless the starter is used continually, when the "dose" should be increased to correspond to the service.

Manipulating the Switch.

What has been said with regard to the cut-out applies also in the case of the starting switch: As it is seldom in use it seldom will require to be touched. There is nothing in it which can get out of order except under the most flagrant abuse, and it is very unlikely that it ever will give trouble. There is just one consideration which must not

Digitized by Google

than will any other part, though the amount in any case will be small.

Sparks That Indicate Trouble.

By reason of the fact that the armature shaft rotates in liberal sized ball bearings, its requirements as regards lubrication will be exceedingly moderate—no more than is required by the average magneto, which is to say, a few drops of oil about once every 1,000 miles will suffice. As the brushes and the commutation surface are large, they will operate for an indefinite time without attention, provided only that they are clean and foreign matter is kept out of the case. Accumulations of dust or oil on the commutator will result in poor commutation, which, in turn, will cause sparking and excessive wear. Theoretically, any dynamo should operate absolutely without sparking at the brushes, though it is extremely difficult to approach theoretical perfection.

Sparking may indicate that the brushes are dirty, that the brush spring tension is insufficient, that the brushes are too short properly to touch the commutator or that the commutator or the brushes are dirty. The remedy for all these troubles is suggested by the trouble itself. Another cause of sparking which generally can be attributed to dirt or to improper brush spring tension is a cut or scratched commutator.

The Story the Ammeter Tells.

If a commutator exhibits scratches, they should be removed immediately before they have time to cause more serious damage, the preferable method being to hold a piece of No. 00 sandpaper against the commutator while the armature is rotating, first removing the brushes from their holders. If the brushes are not removed, small particles of sand may get beneath them and cause far worse scratching than that which is removed. After the sandpaper has been applied, the commutator should be carefully cleaned of gritty particles before the brushes are replaced. The brushes also should be cleaned, a cloth dampened with gasolene being used for the purpose.

Included with the Disco system there is an ammeter which is mounted on the dash and which will serve as an infallible telltale of the operation of the dynamo in addition to indicating the charging current and the amount of current consumed by the lamps. Immediately the car speed exceeds seven miles an hour, the needle of the ammeter should swing over to the charge side, assuming, of course, that no lamps are lighted. If it remains stationary, that fact may be taken as an indication that the generator either is not generating or that the cut-out has not made the connection between the dynamo and the battery. In either case, the cut-out first should be examined to ascertain whether it is performing its function. If it fails to close the circuit, the dynamo next should be tested to ascertain whether it is generating. This may be done by connecting a lamp across the terminals with the engine running at a speed corresponding to about 10 or 12 miles an hour. If the generator is working proppertly the lamp will be lighted, which in itself is evidence that the derangement exists in the cut-out.

When the Starter Refuses to Start.

Loose wires, of course, or broken wires will prevent the passage of current, and in this way prevent the cut-out from working properly. As a matter of fact, loose connections or a broken wire are about the only troubles which will prevent the cut-out from functioning, for there is little in its make-up that can give trouble. If the lights gradually grow dimmer, the condition may indicate that the cut-out contacts have become stuck through some cause or other, thus permitting the battery to discharge itself through the dynamo. Inspection, of course, will reveal the trouble, which generally can be remedied by cleaning the contacts. In some cases the arm of the cut-out may become clogged with dirt, the removal of which, it is needless to point out, will effect a cure.

In cases where the engine starter refuses to start the motor, the battery first should be examined to make sure that it is properly charged. If it is properly charged, a search for loose wires should be made, failing the location of which the motor itself should be examined to make certain that the brushes touch the commutator properly and that there are no broken wires in the circuit.

Part That Carburation Plays.

Although most engine starters are powerful enough to "spin" the heaviest motors at a considerably greater speed than than be attained with a hand crank—the Disco is calculated to "spin" a 4½ x 5½ motor at 150 revolutions a minute for 40 minutes on an 80 ampere-hour battery, the pressure being 12 volts—it should be remembered that the easier it is to start a motor the better the service that will be rendered by an electric starter and the smaller will be the drain on the battery; the mere fact that an engine is equipped with a starter should not operate to cause neglect of carburation and ignition, which fact often is overlooked—to the detriment of the electrical equipment, of course.

Breakage of Spokes in Wire Wheels.

In endeavoring to ascertain the cause of several broken spokes in one of the rear wire wheels with which a motorist had had his car equipped it was discovered that the breaks were not occasioned by violence but were the result of rust. Apparently the enamel with which the spokes were coated had not covered the whole of the spokes where they entered the felloe band, the result being they rusted through and parted. From which it would appear a wise precaution occasionally to examine wire spokes at their nipple ends to make sure that the enamel is intact, for though the breakage of two or three spokes does not seriously impair the strength of the wheel, it nevertheless represents an avoidable and therefore unnecessary expense.

Gould Adds Ignition and Lighting Unit.

The Gould Storage Battery Co., of New York City, which is closely related to the Gould Coupler Co., and which heretofore has confined its activities to the manufacture of storage batteries, has gone deeper into the field and produced a combined ignition and electric lighting system; later a motor starting unit to work in conjunction with the Duplex system as now manufactured will be produced. The feature of the Duplex system is the double wound armature, from one side of which direct current at six volts pressure is obtained for lighting and charging the storage battery, and from the other alternating current which is stepped up to high voltage in a transformer coil and used for ignition; output control for preventing burning out of the lights or injured batteries at high engine speeds is by means of a differential field, and a magnetic relay serves to sever connection with the battery when the machine voltage drops below that of the accumulator.

Paint to Indicate Bearing Heat.

A new heat indicator for bearings just has been introduced by the British General Electric Co., whose headquarters are in London. It consists of a paint which normally is a bright vermilion, but which, on reaching a temperature of 120 degrees Fahr. shows a change of color and at from 190 to 210 degrees becomes almost black. When the temperature of the part falls below 120 degrees, the paint returns to its normal color. Among the claims that are made for the paint are that it is practically indestructible, that it is unaffected by lubricating oils, that it prevents rust, and that the warning which it gives enables a machine to be stopped before damage results from overheating.

Italy Seeks to Stimulate Tractors.

Under the auspices of the Italian Touring Club, a competition and exhibition of farm tractors and agricultural motors is to be held in Parma, Italy. The affair will cover a period of five months, from June to October, inclusive.

"Ribbon" a New F & S Bearing.

Combining remarkable simplicity with solidity of construction in a manner to obtain a number of desirable features, Fichtel & Sachs, of Schweinfurt, Germany, manufacturers of F & S radial and thrust

F & S "RIBBON" RETAINER

ball bearings, of which the J. S. Bretz Co., of New York City, is the sole American importer, have brought out not only a ball retainer, aptly styled the "Ribbon" retainer by reason of its construction and shape, which is quite different from anything else of its type, but has evolved a new self-aligning radial ball bearing.

As its designation implies, the retainer virtually is a continuous ribbon of steel; it is a one-piece sheet steel stamping that is drawn and formed without joints or rivets in its construction. Needless to add, it is very light, lighter, in fact, than the die-cast aluminum separator which has been used to such good purpose in F & S bearsizes, thus necessitating a slight decrease in number. But inasmuch as the load capacity varies directly as the square of the ball diameter, and with the number of balls, it may be appreciated that the increase in the size of the balls possibly more than compensates for the slight decrease in number; as a matter of fact, it is pointed out by the makers, that the load capacity for given sizes of bearings has been increased in some cases by as much as 30 per cent. Another of the advantages of the "Ribbon" retainer is that its construction permits better circulation of the lubricating medium and practically prevents the retention of foreign matter in the bearing.

The new radial bearing is essentially a standard bearing with a slightly spherical inner surface to its outer race; the addition of a washer with a spherical inner surface permits of automatic adjustment for slight shaft disalignment.

Substitute for Glass in Windshields.

For the ostensible purpose of eliminating the glass in windshields and with it the danger of damage in collision, a new product which is styled "non-flam Exonite" and appears much like celluloid just has been placed on the British market by Dover, Ltd., of Northampton. The new material is slightly clearer than celluloid and is considerably tougher and with a higher glaze, that resists scratching to a marked degree. When ignited, it burns out almost immediately, the burned portion being confined to a small area. It is made in five thicknesses in oval and round panels and in sheets measuring 53 x 24 inches.

Experimentation with Aluminum Wire.

The Atwater Kent Ignition System

has been silently advertised from coast to coast by the best advertisement any product can have—the personal endorsement of over 100,000 satisfied motorists.

During the period of the magneto craze, we could have taken advantage of this fad and manufactured magnetos. Due to our facilities and prestige, we could undoubtedly have produced and sold large quantities of them. We knew, however, that the Atwater Kent System was fundamentally correct in principle and that it was better than any other ignition device. This opinion was also shared by thousands of our friends who discarded the magnetos on their new cars and installed the Atwater Kent, claiming they got much better results with much less trouble.

You can't equip your car with a more reliable ignition system than the Atwater Kent—no matter what amount of money you are willing or expect to pay for it. Why then take chances by investing in other equipment when by installing the Atwater Kent System you close every avenue to future regret?

Just a few of the many good features of the Atwater Kent System and its advantages over the magneto:

The spark is of constant heat quality irrespective of the speed of the engine, thereby enabling the engine to be run at a very much lower speed if desired.

The simplicity and accessibility of the different parts of the Uni-Sparker are much greater than in the case of the magneto.

The adjustment of the platinum contacts does not affect the timing of the spark.

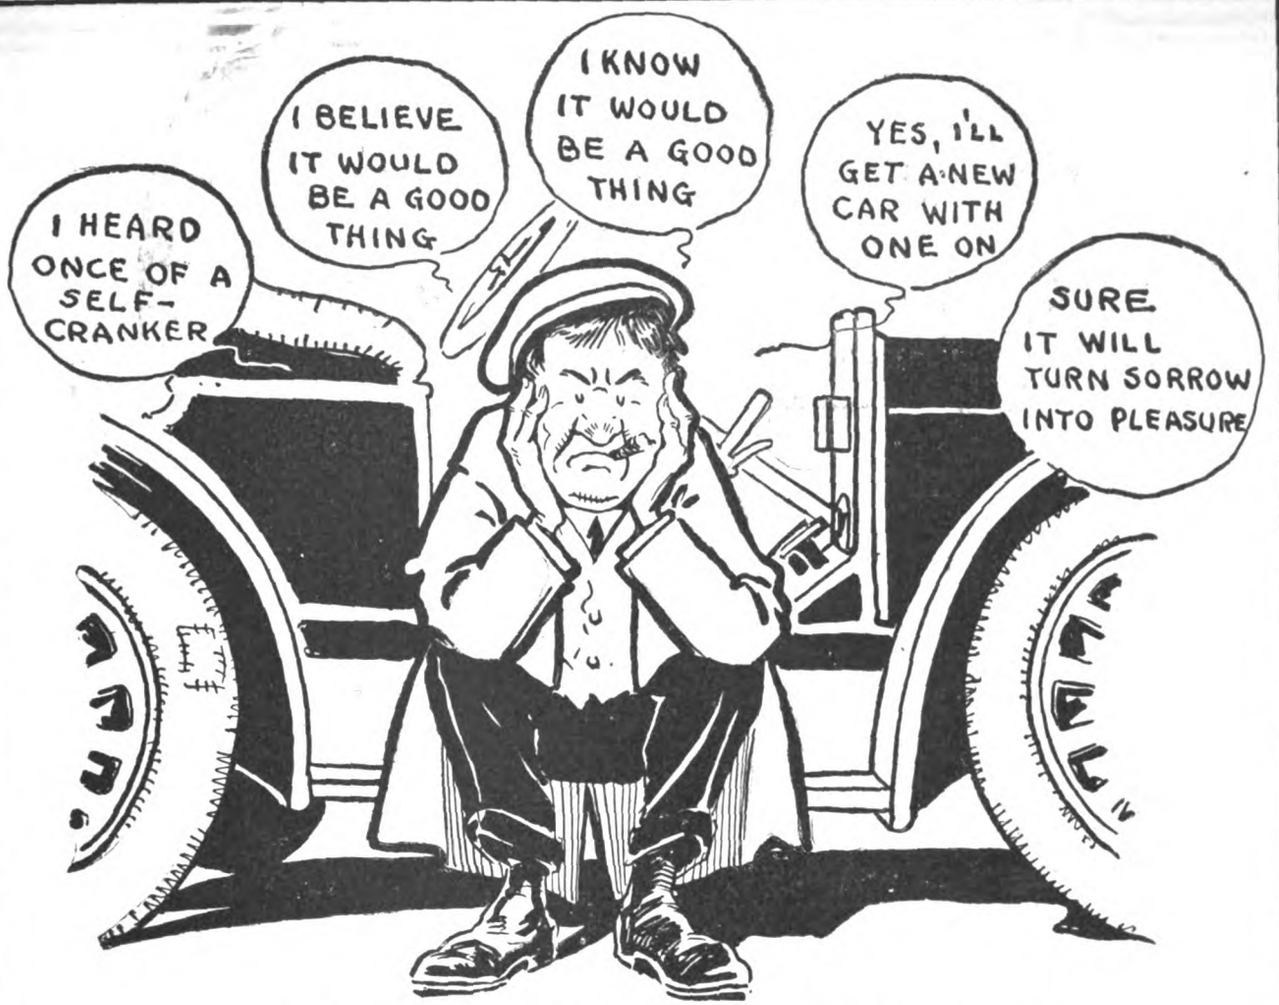
Easy adjustment to lengthen or shorten the spark, thereby insuring the maximum economy of battery current.

Low maintenance cost and repair expense. Will start engine on spark. Duplicate ignition system not necessary. Light weight. No magnets to become demagnetized. Unlimited range of spark advance or retard. Low initial cost.

In connection with the standard Type F System, we are furnishing a new model—Silent Type K with automatic spark advance and insulated primary circuit, especially designed for use in connection with lighting and starting equipment.

PRICES OF THE TYPE F SYSTEM

	Standard Coil	Kick Switch Coil
1-cylinder	$17.00	
2-cylinder opposed	18.00	
2-cylinder distributor type	22.00	$24.00
3-cylinder distributor type	25.00	27.00
4-cylinder distributor type	25.00	27.00
6-cylinder distributor type	27.00	29.00



PRICES OF THE TYPE K SYSTEM

	Standard Coil	Kick Switch Coil
2-cylinder	$32.00	$35.00
3-cylinder	35.00	38.00
4-cylinder	35.00	38.00
6-cylinder	37.00	40.00

If you have an unsatisfactory magneto, or if your engine has no timer shaft, you can use the Atwater Kent System by means of a special "magneto gear mounting," the cost of which is $5.00 in addition to the above prices.

Possibly all that car of yours needs to give perfect service is an Atwater Kent Ignition System

REXO HORN
Electric Warning Signal
GUARANTEED

Electric Warning Signals

Will be standard equipment on most automobiles for 1913

Our present enormous sales prove beyond any question of doubt that the bulb horn must pass into the realm of antiquity.

The Tuto, Tutoette and Rexo electric warning signals, manufactured by us meet the needs of all types and sizes of cars manufactured.

FOR the medium priced car the Rexo horn, made to retail at $8.00, meets the requirements for a guaranteed, reliable, single-tone electric warning signal.

It is instantly responsive and of uniform intensity. It is free from constant care and most effective for emergency, yet not too loud for regular service.

The Tuto two-tone electric warning signal is the highest grade and most complete warning system yet devised.

It electrically transmits two distinct tones, a low note for service and a loud note for emergencies or touring, the degree of sound being regulated by the pressure of the thumb upon a button located on the steering wheel, directly under the hand of the motorist.

These horns are built upon modern electrical principles in everyday use upon thousands of telephones throughout the world. They are reliable, positive, certain.

Either horn can be connected to any ordinary 6-volt battery.

Manufacturers that are now making their plans for 1914 will find it worth their while to get in touch with us.

Elyria-Dean
TRADE MARK

The Elyria-Dean Speedometer

Is the most simple and permanently accurate speed measuring mechanism yet devised

It operates on the **unvarying principle** of centrifugal force ***direct*** **without** being hampered **with compensating** gears, springs, etc.

The action is the **same on the coldest** winter day as in the **heat of summer.** There is no necessity **for temperature** compensators or **means for steadying** the hand.

THE hand is always steady, regardless of road conditions or speed of car, owing to the equi-balanced construction, and shows the speed at a glance by its position and without the necessity of deciphering the figures or marking, the latter being larger than usual for a speedometer of the same diameter.

The odometer is the reliable Geneva movement with trip reset to any one-tenth mile so as to follow guide-book markings.

They always add mileage, never subtract regardless of how the car runs, whether forward or backward, or whether the shaft is driven from the right or left hand wheel.

Elyria-Dean Speedometers respond to the slightest increase in speed.

The dial is **black** with white markings, the case beautifully finished in baked black enamel with nickel trimmings.

Every detail has been so nicely perfected that the complete instrument is in strict keeping with the finest made and most luxurious automobiles.

The Elyria-Dean is the **big idea** in speedometers.

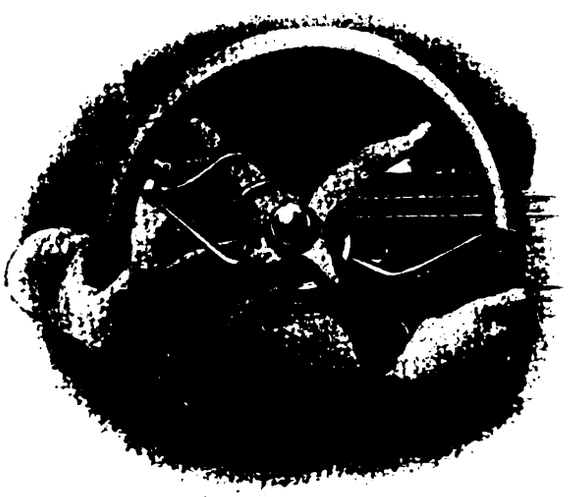
Be a Warm Hand Wheel Dealer



Don't allow your chance to slip. Next week some live wire competitor may be cutting out the big melon slice that you might be enjoying right now. The name and fame of this device is spreading rapidly. Get your territory.

We show here the Warm Hand Wheel with the circuit open and closed. Note that a simple movement of the connection on the left of the wheel will turn the current off or on at will.

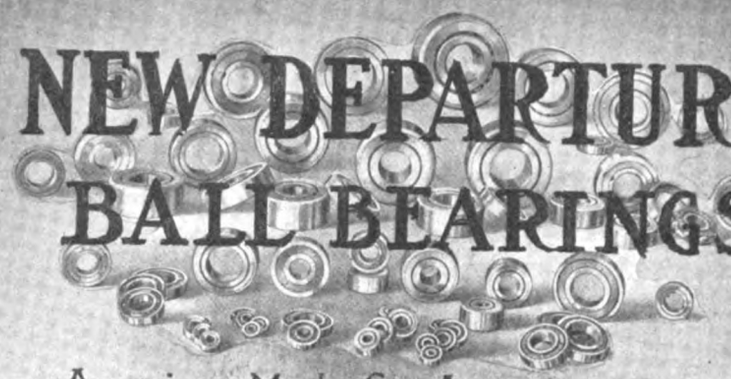
The Warm Hand Wheel will impart a grateful warmth to the driver's hands no matter how cold the weather or how high the speed. It makes winter driving a pleasure and so promotes the use of cars that would otherwise remain in storage during the cold months.

Circuit Open

Circuit Closed

Current consumption is low and the wheel is kept warm through either battery or lighting systems, while Ford owners will find the built-in flywheel magneto ideal for this purpose.

You can install the Warm Hand Wheel in short order, scarcely any work being necessary to "get it going."



Retail price is $15 and your share in the transaction most liberal. Practically no effort is necessary to make a sale. The Warm Hand Wheel just about sells itself.

NEW DEPARTURE BALL BEARINGS

American Made for American Trade

Gasoline Is Going Up---

and the users of motor vehicles are paying the bills. Abroad, where gasoline costs half-a-dollar a gallon, builders of automobiles use only ball bearings.

Why?

Because ball bearings are more thoroughly anti-friction than any other type. Friction scarcely exists in ball bearings, hence less power and less fuel are required to drive mechanism mounted on such bearings.

Other advantages are:

Minimum wear;

Maximum efficiency, endurance and dependability;

Ease of replacement;

Freedom from necessity of frequent adjustment—ball bearings are fool-proof.

The prospective automobile buyer will favor the car that will cost him the least to operate and maintain. This means he will favor the car that is equipped with ball bearings.

You are invited to visit our exhibit, Space No. 204, Balcony, Madison Square Garden

The American made New Departure ball bearings have no superior—are strongly guaranteed and perferred by the majority of American automobile manufacturers.

One such manufacturer says: "More real bearing value than I can get out of any other bearing."

CUBIT

ELECTRIC HORN

$3.00

A Good Horn at a Low Price.

In Black Enamel, very High Gloss.

Weighs Two Pounds and a Half.

Consumes very little current (1½ to 2½ amperes).

Emits high toned Musical Blast.

Has no working parts to get out of order.

Has no VIBRATOR, the diaphragm is the Armature.

Requires no Oil. Runs on SIX VOLTS.

Gets better with age as the "Bulging" of the diaphragm which is detrimental to other horns makes the "CUBIT" more efficient.

Push button and wire that retails for $2.00 packed in separate box, 35 cents extra.

NATIONAL AUTOMOBILE LOCK WASHERS

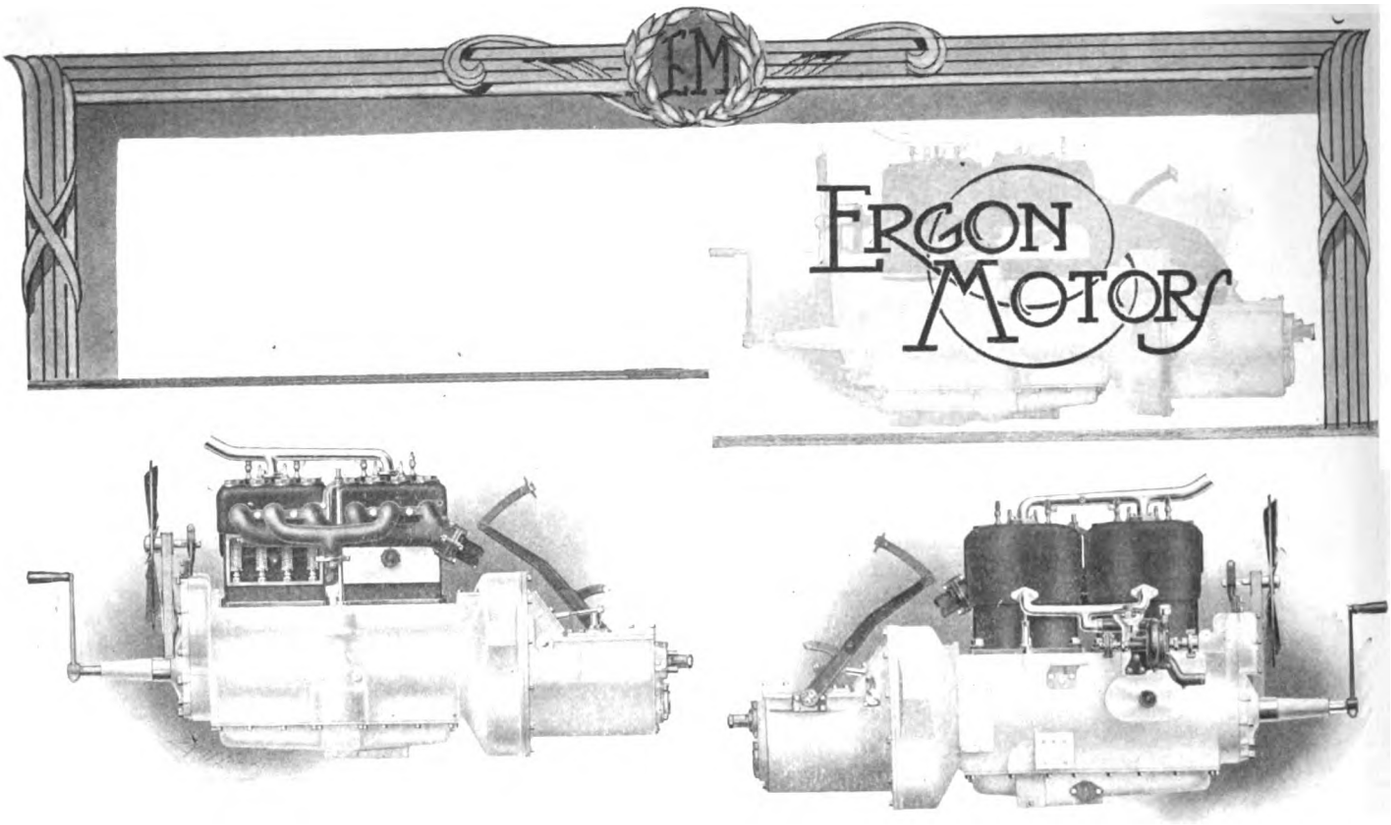
SUPERIOR

QUALITY

COUNTS

LOCK WASHERS SHOWN IN PANEL HAVE BEEN ADOPTED BY THE SOCIETY OF AUTOMOBILE ENGINEERS

The lock washer is a small car part with a mighty big mission. It is evident that this is not realized by the consumer, for in this item the order usually goes down—"get quotations on lock washers."



The lock washer is the bond of the units. If it lacks proper resiliency then it is inefficient and will destroy alignment of bearings and create small or grave troubles in various parts.

The responsible purchasing head (the one we want to reach) will order lock washers that will insure security of parts—and he won't hesitate on a few-cents-per-car-difference.

National Lock Washers are 100 pe· cent. proficient.

THE NATIONAL LOCK WASHER CO. **Chicago, Ill. Newark, N. J.**

The Man in the Box

¶ An air of mystery pervades the carbonizing department of the Timken Plant. Smoke rises from rows of glowing furnaces. Red, white and green signal lights shine through the haze. 'Devil wagons' dive into lurid ovens after red hot pots of carbonized parts.

¶ And off in a corner, quietly watching and guiding it all sits the 'man in the box.'

Timken Tapered  Roller Bearing

¶ To the carbonizing room come all the cups. cones and Rollers for the Timken Bearing. Accurately made as they are, from the best of steels, by the finest automatic machinery, they are far from fit for service in the motor car.

¶ In this huge room the parts are carefully packed in iron pots with a mixture rich in carbon. Then heated in furnaces to just the right temperature for just the right length of time.

¶ Carbon from the black mixture penetrates the skins of the cups, cones and rollers so that, later, the surface of each part can be made glass-hard to resist wear while the core remains soft and elastic to withstand shocks.

Time-Tried Formulas

¶ The time in the furnace and the degree of heat, vary for each particular size of cup, of cone, of roller. The exact formula for each has been developed by years of experiment and study.

¶ The formulas have been proved right by minute records of results in service. Records that cover millions of Timken Bearings in hundreds of thousands of cars.

Must be Followed

¶ It's the duty of the man in the box to *know* that the formula for every size of every part is followed exactly by the furnace men. And this is how he knows it:

¶ Wires lead from an electric resistance thermometer in each furnace to a switchboard in his box. Every quarter hour he connects each oven with the pyrometer before him, reads and records its heat and compares it with the formula for the size of the part that particular furnace contains.

¶ Other wires from the box carry order signals back to each oven. Red, white and green lights tell the furnace man to slightly raise or lower the heat or to hold it as it is.

Correct Design Won First

¶ Years ago no such painstaking care was used in making the Timken Bearing. Yet even in those days its unique design was right—its principles have never been changed. They have proved right in the crucible of service.

¶ But years of striving towards perfection in every process of manufacture have added to rightness of design a very real though a less important value.

The Timken Roller Bearing Company

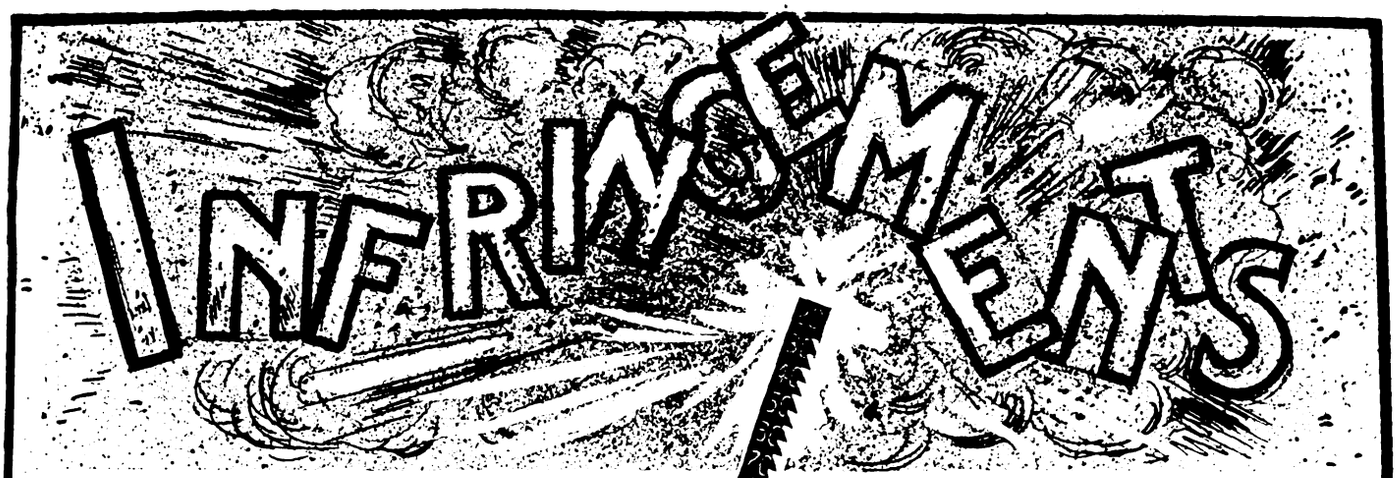
THE SELDEN TRUCK

$2000

With a proper conception of just what constitutes an efficient commercial car, the manufacturers of the Selden One-Ton Truck have produced a car that stands out conspiciously as the leader of its class.



While it embodies the same principles of construction as those found in the best trucks on the market, it is distinctive in that it is stronger and has a larger factor of safety than other trucks of like capacity.

The Selden Truck is built not merely to sell but to do its work and do it satisfactorily day in and day out, with the least trouble and expense to the user.

The Selden Truck is Easy to Buy and Easy to Pay For

In order to put the commercial car within easy reach of all those who need it, but who find it inconvenient to take from their business the necessary funds with which to pay spot cash, we have inaugurated a partial payment plan that removes the last obstacle in the way of thousands of prospective buyers.

TWITCHELL PATENT AGAIN SUSTAINED

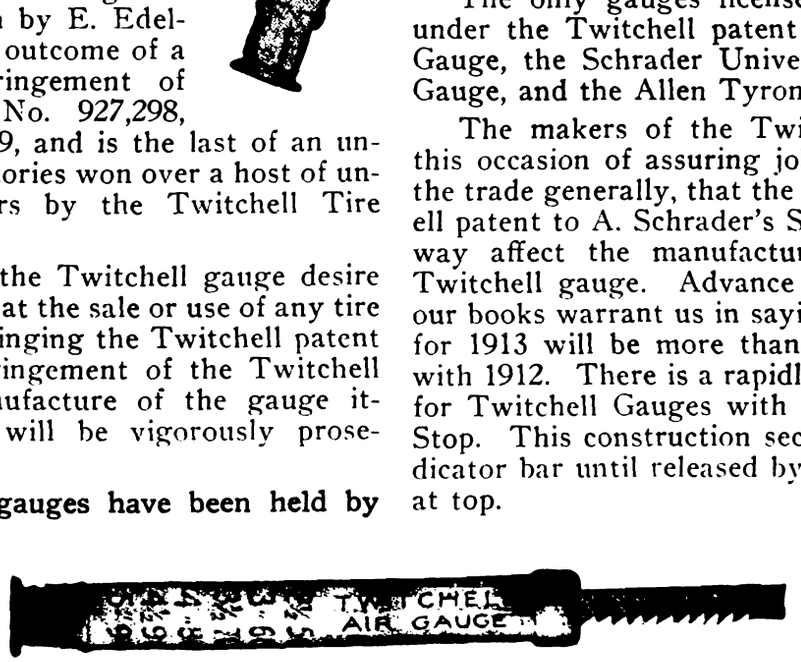
On December 18, 1912, a preliminary injunction restraining E. Edelmann & Co., of Chicago, from the manufacture, sale and use of the Edelmann Economy Gauge was issued by Judge Humphreys in the U. S. District Court for the Northern District of Illinois.

This injunction, issued against vigorous opposition by E. Edelmann & Co., is the outcome of a suit charging infringement of Twitchell patent No. 927,298, dated July 6th, 1909, and is the last of an unbroken series of victories won over a host of unscrupulous imitators by the Twitchell Tire Pressure Gauge.

The makers of the Twitchell gauge desire to warn the trade that the sale or use of any tire pressure gauge infringing the Twitchell patent is as much an infringement of the Twitchell patent as the manufacture of the gauge itself and as such will be vigorously prosecuted.

The following gauges have been held by the courts to be infringements of the Twitchell patent:

The Northam Gauge—Twitchell vs. Northam Auto Pressure Gauge Co.



The Prest-O-Lite Gauge—Twitchell vs. Prest-O-Lite Co.

The Safety Tire Gauge—Twitchell vs. Rudolph & West Co.

The only gauges licensed for use or sale under the Twitchell patent are the Twitchell Gauge, the Schrader Universal Tire Pressure Gauge, and the Allen Tyrometer.

The makers of the Twitchell Gauge take this occasion of assuring jobbers, dealers, and the trade generally, that the sale of the Twitchell patent to A. Schrader's Son, Inc., will in no way affect the manufacture or sale of the Twitchell gauge. Advance orders already on our books warrant us in saying that our output for 1913 will be more than double, compared with 1912. There is a rapidly growing demand for Twitchell Gauges with the positive Lock-Stop. This construction securely locks the indicator bar until released by pressure of finger at top.

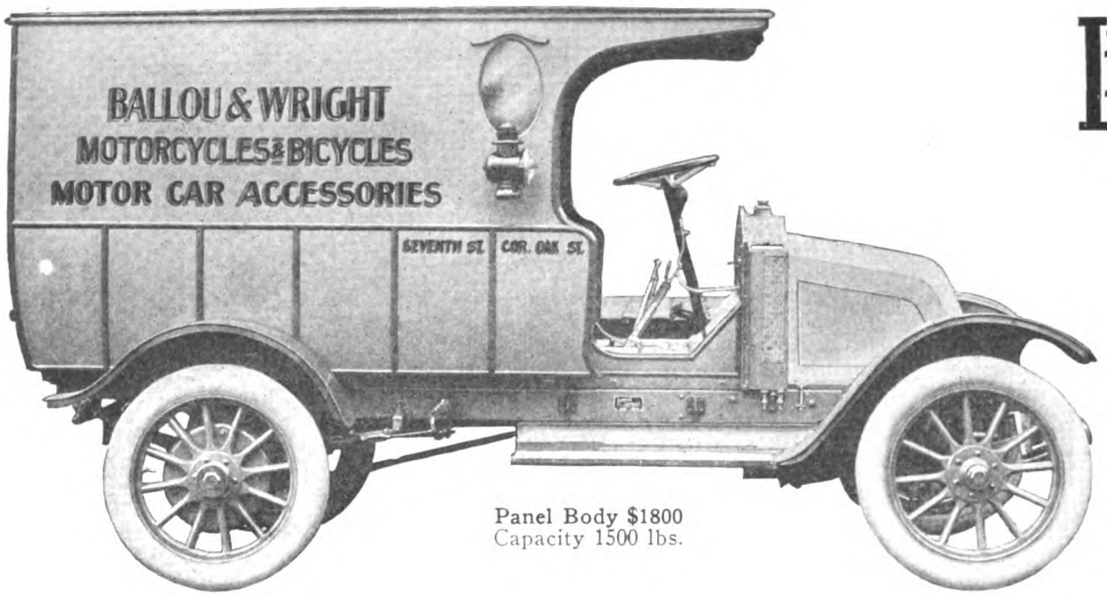
Hyatt Quiet Bearings

The Standard Type of the Hyatt Roller Bearing is designed with generous bearing length. This permits the rollers to operate directly on a steel shaft, thereby simplifying the construction.

The flexibility of the Hyatt Roller affords full line contact, hence an equal distribution of the load along the entire length of the bearing. Overloading at any particular point, causing excessive wear, is thus avoided.



The rollers of the standard type are now made of Chrome Nickel Steel, resulting in a greatly increased carrying capacity. Lubrication is positive—the rollers forming oil reservoirs. The right and left spirals distribute oil to every part of the bearing. Grit and dirt work through into the center of the hollow rollers, thus preventing grinding which would result in wear.

These are exclusive features of the Hyatt Roller Bearing.

The Delivery Car That Has "Made Good"

Panel Body $1800
Capacity 1500 lbs.

Lippard-Stewart

The Delivery Car

CHASSIS
List - - - - $1650

BODIES
Standard Panel - $150
Standard Express 125

The Lippard-Stewart Model "P" 1500 Lbs. Delivery Car—30 H.P.

When You Choose a Delivery Car select it as you would an employee who is most vital to your business. Go over its past record. Find out what it has done for others—what it will do for you. Analyze the car in every detail. Not merely its outward appearance but every detail of its construction. Know your car—know its makers—know its ability to fulfill your requirements. Intuition may tell you that the Lippard-Stewart is a good car, but analysis, comparison with other cars, past record and logical reasoning will prove to you that it is the peer of all cars for light delivery purposes.

Sound Commercial Car Construction is the basis of the Lippard-Stewart's supremacy. It is purely a delivery vehicle. Designed and built a commercial vehicle from tires to top, from tailboard to headlight. It represents the practical ideals of men who have made a careful study of transportation and delivery problems. That is why it fulfills the demands of every business man or company whose need is a prompt, efficient and economical delivery system. It has demonstrated in almost every instance that it will deliver more goods over a wider territory than is possible with horse and wagon. Its dependability is a proven fact. It does its work well in fair weather and foul and is ready for every emergency.

of greatest stress. Note the 30 Horse Power Continental Motor. Consider the rugged cone clutch and the transmission strong enough for a 50 H.P. Car. Observe the shaft drive, the differential, the simplicity of construction practiced throughout the entire building of the car—the easy get-at-ability of every important mechanical part even when the car is loaded. Look at the perfect spring suspension that assures easy riding and minimizes wear and tear. Then

Consider the Price of the Car—its sound dollar for dollar value. Compare it with any car apparently competing with it. Note how the Lippard-Stewart Car actually baffles competition. If you are a prospective purchaser, note the real worth of the car. If you are a dealer, form your own conclusions as to the car's value as a business investment—its ready salability and the quick turnover of capital it assures.

Note the Comprehensive Lippard-Stewart Line—the volume of sales it makes possible—a line that offers you a car to meet the specific demands of practically every firm and individual who need a delivery car regardless of their business—a line that knows no dull seasons and a car that practically sells itself and stays sold winter or summer.

THE LARGEST AUTO SUPPLY HOUSE IN AMERICA

Our Name Is Your Guarantee

WHATEVER you buy from the house of CHAS. E. MILLER you may expect the fullest degree of satisfaction in every detail. Quality, quantity, material, workmanship, durability will be just right or we will make it right. Our name is your guarantee.

To buy from a house the size and standing of this one is the safest way to insure complete satisfaction in all your dealings. We handle goods of **standard quality only** and of course stand back of everything we sell.

No matter what you want in the line of automobile accessories or supplies, remember our slogan, "We Either CARRY IT IN STOCK, WILL GET IT—OR IT ISN'T MADE." One of the prize winners in MOTOR'S recent advertising contest selected this as the slogan out of the many shown. His reason was as follows: "This saying is the clearest possible statement of the Miller business policy which I have found to be a fact through several years of satisfactory relations with them."

Our Annual Catalog is the largest, most complete, up-to-date and authoritative dictionary of the auto supply market of any book published. It has come to be recognized as one of the standard reference works of the industry.

The total distribution of one hundred thousand copies of this catalog practically covers the world, at least wherever automobiles are used. Nearly all foreign as well as domestic automobile manufacturers and dealers, the offices of American Consuls, Public Libraries, Universities, Y. M. C. A. Schools, Publishers, Automobile Clubs, Engineers' Offices, Purchasing Departments—in all these places you will find a copy of the Miller catalog on file.

Fifteen branches spread over the United States, located in the principal motoring centers, bring Miller service within the reach of practically every motorist in the United States. Prompt delivery, perfect quality, honest prices—these are the things that distinguish Miller service and explain the marvelous growth of this pioneer establishment since its inception in 1896.

STANWELD Rim No. 30 is designed for those who require a demountable rim of minimum weight and extreme simplicity.

It has both the quick detachable and demountable features and is made in two styles, one for straight side tires and one for clincher.

This rim is split circumferentially, the two sections having corresponding lugs that are locked together by two semi-circular rings. One end of each ring is securely rivited to the wider portion of the rim base. The free ends of these rings are secured by a swinging latch which is in turn locked by a cam latch.

No special tools are required to operate this rim and no circumferential movement of either section is necessary to disengage the two parts of the rim base.

The rim base of STANWELD Rim No. 30 will fit the felloe band of either the Continental Gilbert type rim or the Standard Universal No. 3 rim, without requiring any special wheel work or additional equipment.

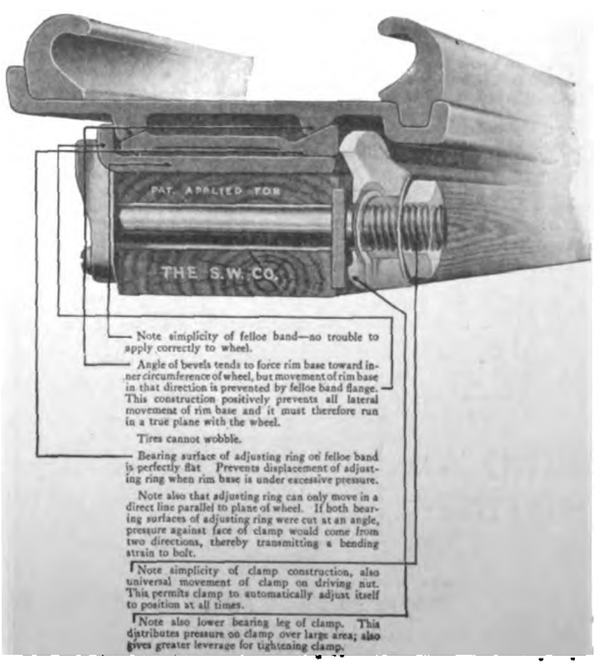
The Standard Welding Co.

Digitized by Google

STANWELD demountable rims, series No. 40, stand alone in their pre-eminent efficiency.

Universal in their acceptance of tires, automatic in their mechanical operation, combining both a quick detaching and demounting feature which operate independently, and positively preventing wobbling of tires, they surmount all the defects of former types of demountable rims.

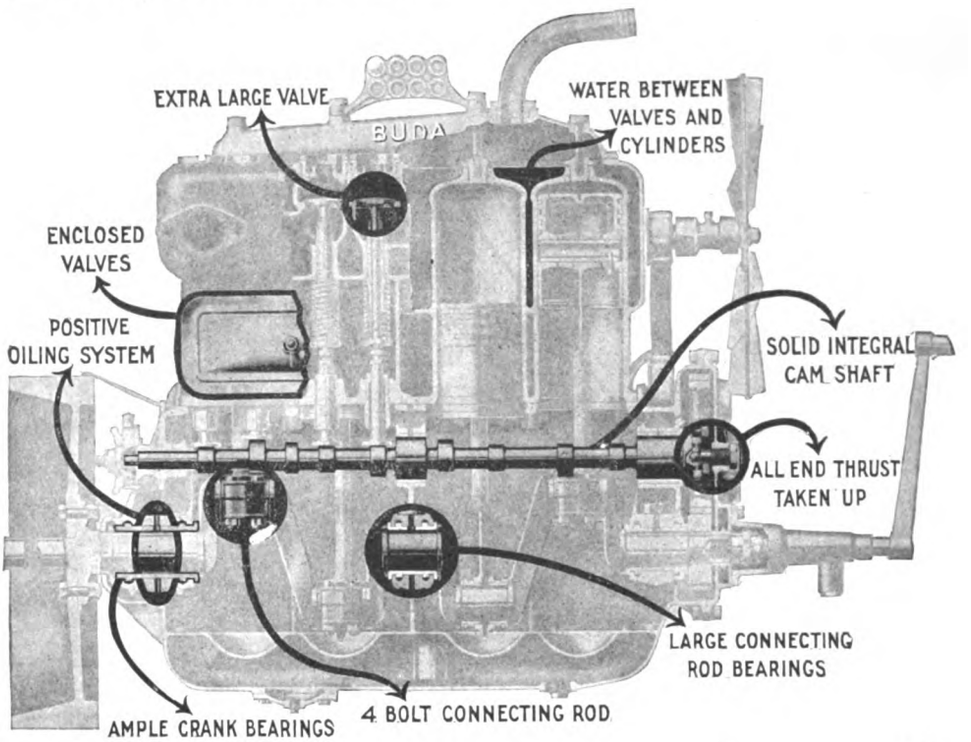
STANWELD rims, No. 40 series have an entirely new feature for the securing of the rim base to the wheel —The adjusting ring. This device is an intermediary band that lies under the entire rim base and supports it at all points of the front and rear circumference.



The rim base has the felloe band flange as a guage for its lateral position and must always lie in the same perfect position on the wheel no matter how the clamping devices are tightened. This is the preventive of tire wobbling, one of the prime reasons for excessive tire expense.

Number 40 STANWELD rims are the wheel equipment on all leading makes of cars.

The Standard Welding Co.



Cleveland, Ohio

The LUXURIOUS BROC

Dollars do not count—under these conditions

THE Luxurious Broc Electric is built without regard to expense.

Quality interests us before, and much more than, cost.

By that we mean that wherever efficiency, luxury or satisfaction could be added, cost has been—and is—no object.

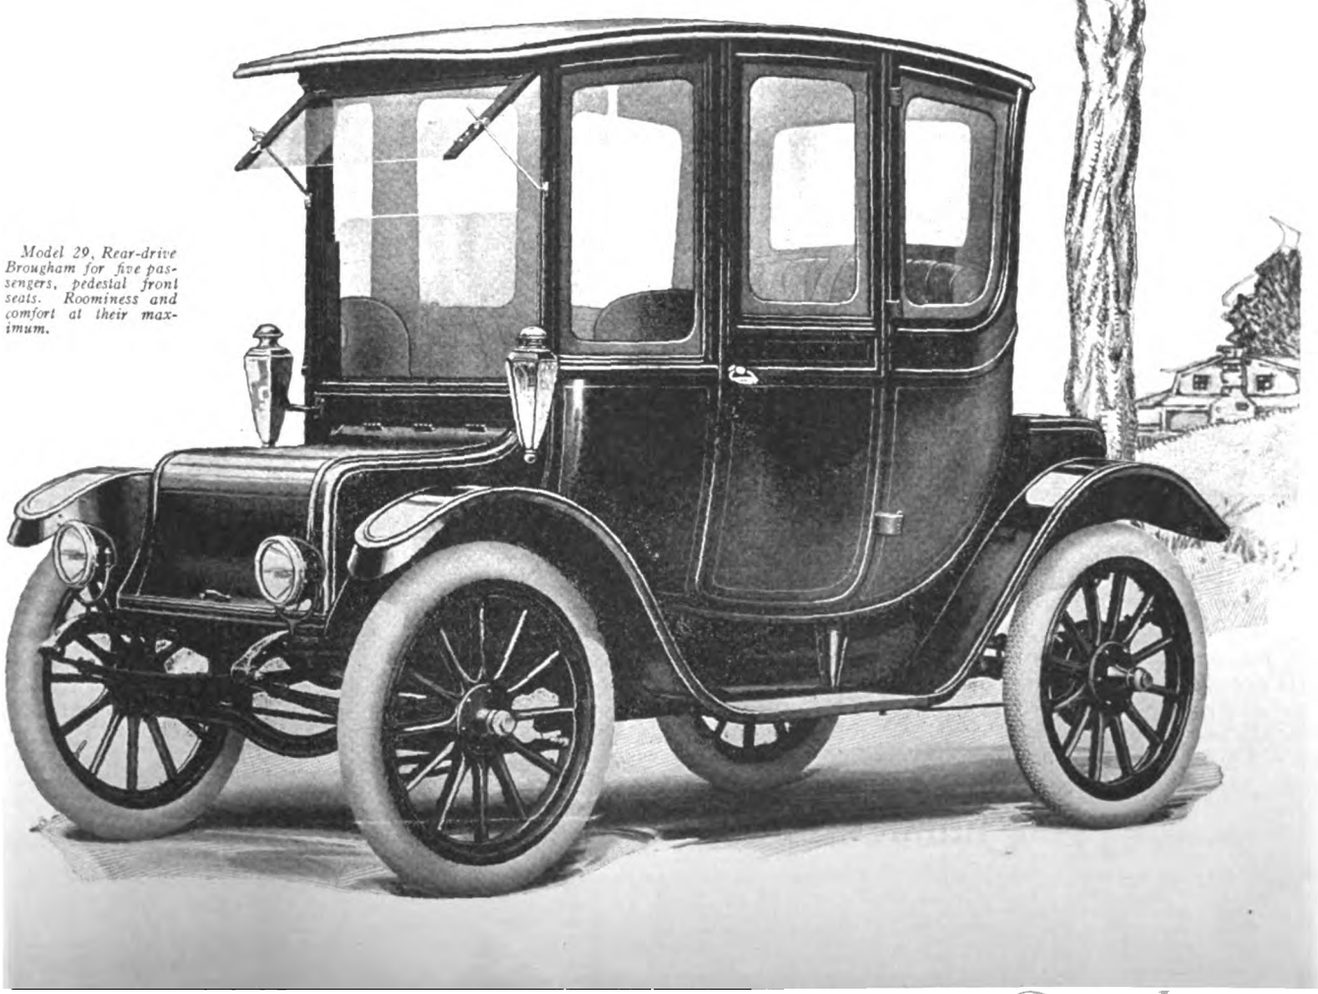
Do not infer that we throw money away. Every dollar of manufacturing cost means actual value put into the car—in quality, and in satisfaction to the owner. There is no waste on non-essentials, nor by unscientific manufacturing methods. We buy value always.

The heart of the matter is this: When a maker would add to quality, he must add to cost. To court cheapness is to lower quality.

The best car cannot be a cheap car.

The perfection of The Luxurious Broc is due to this fact that costs are not feared. The Broc is not built to meet a price.

Our aim is the best car that can be built. We believe that we have achieved it. We believe that we can demonstrate this to you by showing you, in the car—in every part of the car—the quality we are talking about.



The forward-drive model has pedestal front-seats; wheel or lever-steer is optional. Rear-drive models provide pedestal or stationary front-seats.

We will exhibit at the Chicago Show (space B7) February 1-8.

Exide or Ironclad Batteries.

The BROC ELECTRIC VEHICLE COMPANY

Chalmers "Thirty-Six"

$1950 Can't Buy Any More Automobile Than This—the Chalmers "Thirty-Six"

MANY thousands of owners will tell you just what we say above —"$1950 can't buy any more automobile than the Chalmers 'Thirty-Six.'"

Many of them will go further. They will tell you that for real service and satisfaction you can't buy any more automobile for any price.

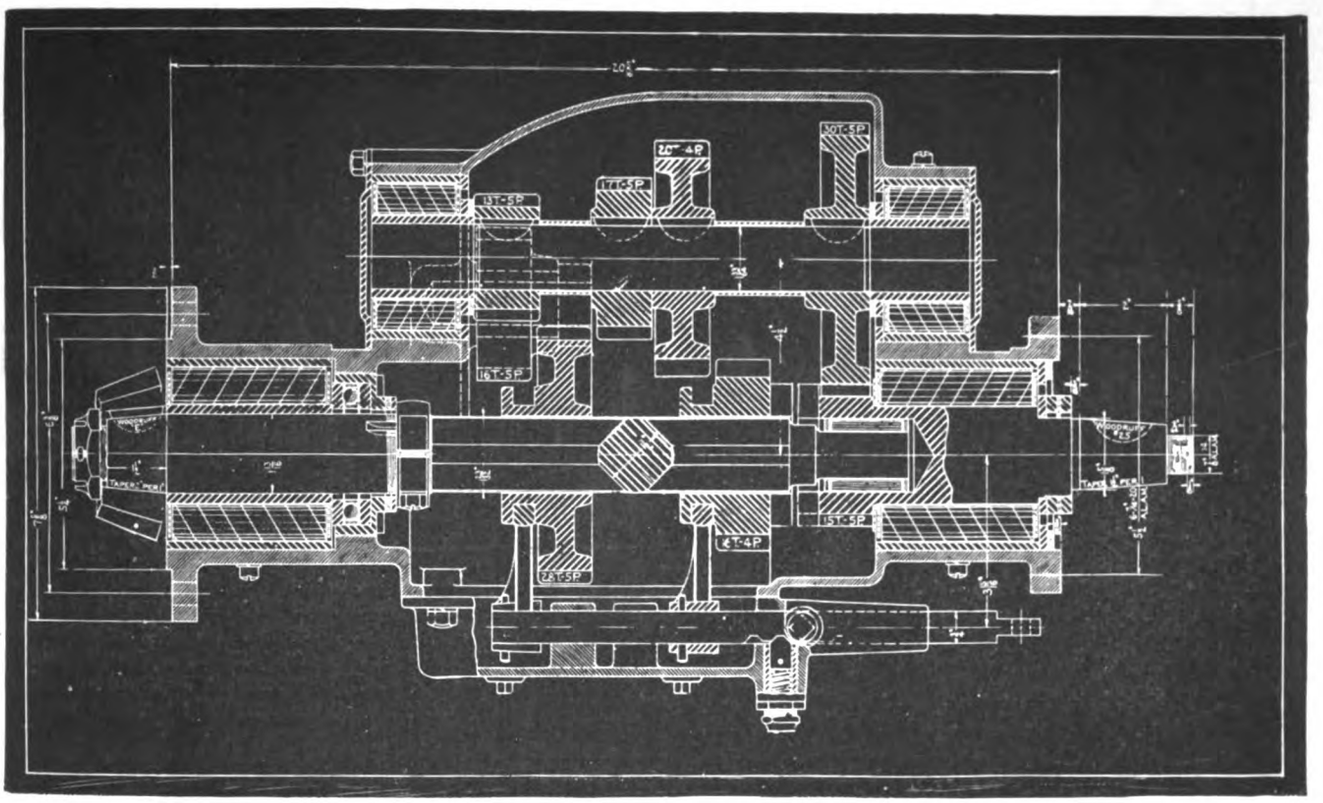
And these owners speak from personal experience. They have driven these "Thirty-Sixes" hundreds of thousands of miles. They have used them under every possible condition—of climate, roads, hills, city traffic, country touring. They know. So we feel safe in offering you their opinion as the biggest reason why you should buy a Chalmers "Thirty-Six."

When you examine this car carefully we For the "Thirty-Six" is a big car—nothing cramped or skimpy about it.

Every Convenience At Hand

And now note the convenience of starting. Everything necessary is within easy reach. The switch is turned on without even leaning forward. The carburetor is adjusted from the dash. Pressing a foot button puts the motor in action; for the Chalmers self-starter starts. If it is night, an electric switch turns on at will any or all of the lights.

As the car gets under way, note the wholesome, businesslike sound—as you pass from first speed to second, to third, to fourth speed. No noise, or grating, or clashing, no grinding, whirring sound as the car picks up speed. For Chalmers gears are ground to an accuracy of ½ of 1/1000 of an inch.



and roar. The "Thirty-Six" with its big wheels, big tires, long springs, solid, substantial construction—heavy enough, but not too heavy—gives you much the same, comfortable and secure feeling as a Pullman car.

All day you can ride in a "Thirty-Six" without fatigue or strain, physical or mental. No shock or jar, no worry. Perfect safety, perfect confidence, perfect satisfaction are yours in this splendid car. You have the delightful consciousness of owning a car you can always be proud of.

Never Before Such Value

Three years ago a car like this was impossible at any price. Picture in your mind all that the "Thirty-Six" gives in looks, in comfort, in convenience, in power and speed. Such a combination of desirable things simply couldn't be bought three years

HOFFECKER SPEEDOMETERS

MANUFACTURERS-Equip your cars with this quality combination

The Hoffecker Speedometer

In the Realm of Speedometer Authority "THE STEADY HAND" HOFFECKER reigns supreme. It has stood rigid and exhaustive tests made by some of America's leading mechanical engineers, and has as a result been selected for speedometer equipment on some of the most prominent motor cars.

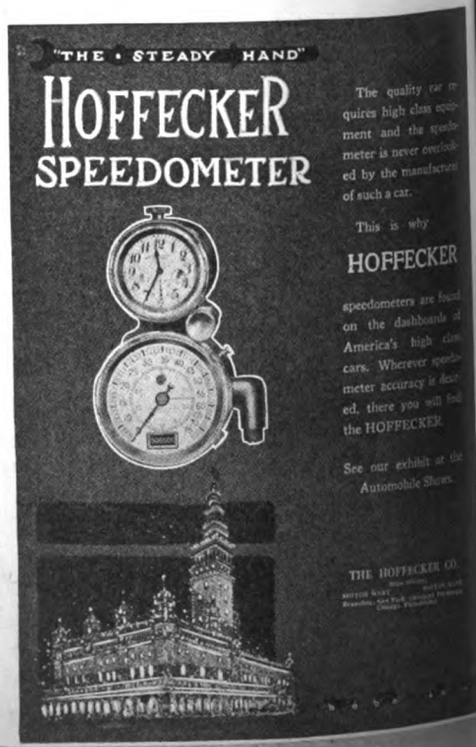
Its **superior workmanship** and scientific construction; its every refinement in mechanical detail, distinguishes it as the one PAR EXCELLENT speedometer in both **artistic appearance** and **satisfactory service.**

"Hoffecker is to a Speedometer

ABSOLUTE ACCURACY—obtained by a special **individual calibration process.**

A DAILY TRIP—giving intermediate distances which can be **easily** and **quickly** set to any desired mileage.

An instantaneous resetting TENTHS DEVICE, designating fractions of a mile—are some of the **individual** and **exclusive** HOFFECKER features.



There are TWO models furnished either singly or in combination with the **famous** WALTHAM TIME-PIECE.

Discriminating users specify the HOFFECKER, the speedometer with **continuous service**—Seventh year of DEPENDABILITY.

DEALERS — Insist upon this equipment on the cars you sell

WALTHAM TIMEPIECES

The Waltham 8 Day Timepiece

The past year has but given stronger emphasis to the superiority of Waltham 8 Day Time-Pieces—has proved conclusively that they are like Waltham Pocket Watches in a class unapproachable in reliability.

They have been used under all the varying conditions to which a car can put them and found to be absolutely dependable time-pieces.

They are built to Waltham Standard, which means they are the acknowledged leaders of the world.

what Waltham is to a Timepiece"

They are the only 8 Day Time-Pieces that have 15 jewels and adjusted to temperature; movement runs 8 days; has winding indicator.

Two of the models are cased to match Hoffecker Speedometers, thus insuring artistic uniformity of speed and time equipment, all with greatest efficiency.

For sale by leading jewelers and auto supply houses. Interesting, illustrated literature free.

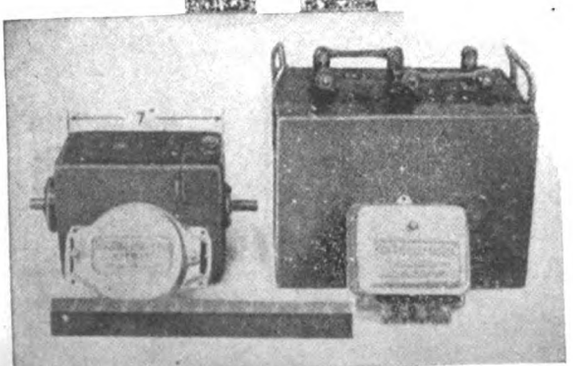
The WARD LEONARD System for Lighting and Starting Every Trial a Triumph



PARTS OF LIGHTING DYNAMO

· WARD LEONARD ·

· Lighting - Starting ·

COMPLETE EQUIPMENT FOR LIGHTING SYSTEM

Every trial of a Ward Leonard System means triumph for its designers and satisfaction for its users.

Every user—every dealer—every manufacturer realizes the need of an efficient lighting and starting system.

But each one of them wants the ultimate system, and the ulitmate system will be that one which is theoretically, scientifically and practically correct.

There must be no complications, no unnecessary parts, nothing to get out of order.

The system that will answer these requirements is the Ward Leonard System.

Time and exhaustive experiments through twenty years of electrical experience have shown that the Ward Leonard System is perfect.

We realized years ago that the value of an electric lighting and starting system to the automobile manufacturer lay in the perfection of its automatic control. Our perfection of this feature stamps the Ward Leonard System as the ultimate choice of engineers.

INVADER OIL

ANNOUNCEMENT

Mr. T. E. Tomlinson has joined forces with Charles F. Kellom & Co., makers of INVADER OILS, the oldest and best known brand of automobile oils on the market, and in the future these will be manufactured and sold by a corporation known as THE INVADER OIL CO.

To Mr. Kellom's existing organization will be joined Mr. Tomlinson's old selling force so long associated with him and so well known to the trade.

Increased facilities for distribution have been provided to insure prompt deliveries.

Under the brand INVADER will be marketed the best oils in the world.

INVADER OIL COMPANY

Lessees of CHARLES F. KELLOM & COMPANY

Main Office: 80 Broad Street, New York City

PHILADELPHIA BRANCH:

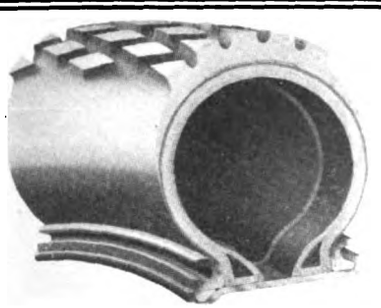
VISIBLE GAP SPARK PLUG TELLS ITS OWN STORY

Through the window in the porcelain of the plug—**outside** the motor—you can instantly tell if the plug is firing correctly. You can see the spark jump the gap in the central electrode at any time—the darkest night shows it up clearest.

It Simplifies the Trouble Hunt by Half



If there is a spark in the window, but proper ignition fails, you know the points are fouled. In that case, just turn the knurled micrometer nut at the top of the plug with the fingers and separate the visible points still more. This increases the intensity of the spark, breaks down all oil or carbon deposits between the points and automatically cleans them in

One Glance Through the Window Tells All

You need a set of these plugs in your motor. Send for a set now, enclosing price and size wanted **(or tell make of car)**, and we will forward them at once, prepaid. Our rigid guarantee of positive satisfaction or your money back goes with every plug.

No-Rim-Cut Tires 10% Oversize

By Far Outsell All Others

This Winter Tread

Will Indicate Why the Goodyear Won

Last year we sold 918,687 automobile tires.

Yet we failed to keep up with the flood-like demand by some 400,000 tires.

Seven years ago only one tire in ninety was a Goodyear tire.

Three years ago the demand was still one-twelfth as large as now.

Last year's sales by far exceeded our previous 12 years put together.

What has awakened men to Goodyear tires in this overwhelming way?

This winter tread will tell you. It shows how far we go, in every way, to multiply efficiency. To cut down tire expense.

This is only one item, but it reveals the entire Goodyear code.

Compare this tread with others, and you'll see why Goodyears won.

Note the Double Thickness

In this Non-Skid tire we add an extra tread almost as thick as the regular. Thus we give you a double-thick tread.

This extra tread is of very tough rubber, immensely enduring, almost impervious to wear.

Because of its thickness, the blocks are deep cut. Their non-skid efficiency lasts for thousands of miles.

A Bulldog Grip

These sharp-cut blocks present to the road surface countless edges and angles.

They grasp the road in every direction with a fairly irresistible grip.

But the greatest advantage lies in the fact that these blocks widen out, so they meet at the base.

They are not separate projections, which center the strain on a small part of the fabric. They distribute the strain exactly the same as with smooth-tread tires. That's the main reason why the Goodyear Non-Skid gives such exceptional mileage.

Compare this tread with others. Compare its thickness, the depth of its projections. Compare the apparent efficiency, due to these sharp-cut blocks.

Compare the way in which strains are distributed so the fabric can't be broken. One glance will show you that this Non-Skid surpasses anything else of its kind. About 250,000 of these treads have already been tested out.

Other Troubles Ended

Thus we have ended skidding troubles in the most effective way.

Years ago we ended rim-cutting, just as completely, just as efficiently.

Our patent tire—the No-Rim-Cut tire—has made rim-cutting simply impossible.

And that alone cut tire expense 25 per cent.

Our 10 per cent oversize, under average conditions, adds 25 per cent to the tire mileage.

Our 14 years of ceaseless tests and comparisons have brought our tire quality up to the maximum.

These things together, in the test of time, have placed the Goodyears on at least a quarter million cars.

One Must Respect This Verdict

Remember, please, that tire expense forms your major cost of upkeep.

A tire which cuts that cost in two is something quite important.

Men know when they get it in these days of odometers. They know which tire serves best. And the final verdict of these men who know favors Goodyear tires.

Men have tried and compared now pretty close to 2,000,000 Goodyear tires. As a result the sale of these tires has doubled every year. And last year's increase was 125 per cent.

Now these tires by far outsell all others. And this year's output, if this increase continues, will completely equip 500,000 cars.

One may easily question any maker's claims. But when hundreds of thousands of users unite, one must respect their verdict.

The verdict of experience favors Goodyear tires in an overwhelming way. And every month makes the verdict more convincing.

Is it not fair to suppose that your experience will bring a like result?

If you think so, get that experience. Make some comparisons. Settle this question by next time insisting on Goodyear No-Rim-Cut tires.

SPRINGFIELD CONVERTIBLE BODIES

Dealers who anticipate the wants of hypercritical car buyers will be quick to see the advisability of specifying Springfield Convertible Bodies, for it stands that they make good cars still better and the quality argument they offer is too big to be discounted.

As specifications they offer a strong selling argument for both the manufacturer and dealer.

Beauty, convenience and sterling worth of these bodies is apparent to all who have seen them and studied their construction.

We show here an illustration which is a faithful picture of one of these products—made in a factory equipped to turn out bodies and tops of every style and size, from the smallest runabout to the most pretentious limousine or landaulet.

Send for complete details of construction.

Tie up to the GENUINE DUNLOP Straight-Side Tire

It is the premier automobile tire of the world

Our Dunlop Sales have increased 600% within the past year's time and the coming year is destined to show an even greater growth.

Motorists have come to realize what tire experts have long known, that the genuine Dunlop Straight Side is in many respects the ideal type of motor car tire.

The dealer who stocks Dunlop Tires now and pushes them vigorously among his trade will get the full benefit of this tremendous increase in business.

But bear this in mind—the Genuine Dunlop Tire—the tire that has shown this tremendous increase in popular demand—the only tire that possesses all the merits of this type, was originated and is now made exclusively by the

Prest-O-Starter

Starts your engine (old or new) quickly and easily in coldest weather

For Four Cylinders $20

For Six Cylinders $25

$1.50 extra for two-way valve necessary when the same Prest-O-Lite is used for both starting and lighting.

Here's a starter that adds practically no weight to your car, is perfectly simple and is as durable as the engine itself. Easily applied to any engine, old or new, very economical in the use of gas, and requires no expert repairing.

How Prest-O-Starter Works

The principle of starting a motor with Prest-O-Starter is the same as "starting on compression." A measure of acetylene, at low pressure, is pumped from your Prest-O-Lite into the cylinders.

Touch your spark—your engine starts.

Unlike "gasoline priming," it is not affected by heat or cold. It is certain.

In cool weather, by opening a valve on the dash, you can feed gas at low pressure into the intake manifold. This allows your engine to run on acetylene until it is warm enough to run on gasoline.

If the Prest-O-Starter did no more than prime your engine in this way during cold weather, this convenience would be well worth the price.

But Prest-O-Starter is more than a primer. When installed properly, it will start your engine, summer or winter, almost invariably without recourse to the crank.

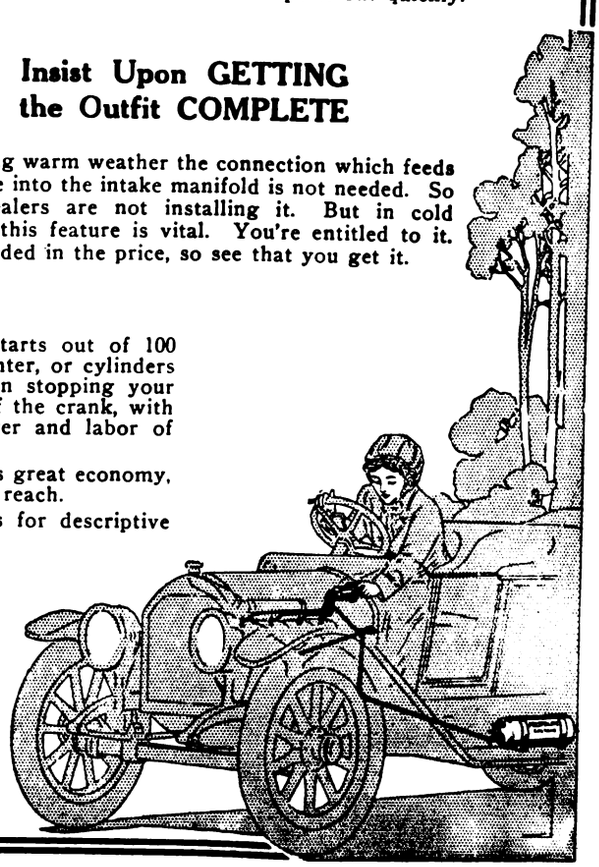
Make Sure Your Starter Is Installed CORRECTLY—Look It Over

The Prest-O-Starter is easy to install correctly. In fact, it's so very easy to install that some good factories and garages install it with utter carelessness, overlooking the one or two simple features vital to success in operation. Fortunately this is an easy matter for the car owner to correct, even if he isn't a mechanic.

Our literature tells you exactly how the Prest-O-Starter is installed, and how to adjust it. Anyone can give it the slight attention it may need or quickly tell a dealer where the trouble lies.

Every Prest-O-Starter is sold with the assurance of satisfactory service. The entire Prest-O-Lite Organization is back of every one. If you have any trouble, report it to us or to our nearest branch. We'll wipe it out quickly.

Insist Upon GETTING the Outfit COMPLETE



During warm weather the connection which feeds acetylene into the intake manifold is not needed. So some dealers are not installing it. But in cold weather this feature is vital. You're entitled to it. It's included in the price, so see that you get it.

Now—More Than Ever—You Need One

Your Prest-O-Starter, properly installed will average better than 95 starts out of 100 attempts. The few failures are caused by your motor stopping on dead center, or cylinders filled with burnt gas. Both of these conditions can be easily avoided when stopping your motor. But should either or both happen, an eighth or a quarter turn of the crank, with the switch at neutral, will remedy the trouble at once, with all the danger and labor of cranking eliminated.

Rest assured that no other starter can give you as high efficiency with as great economy, durability and freedom from mechanical trouble. The price is within easy reach.

Get in touch with any of our branches—or your dealer—or write us for descriptive literature

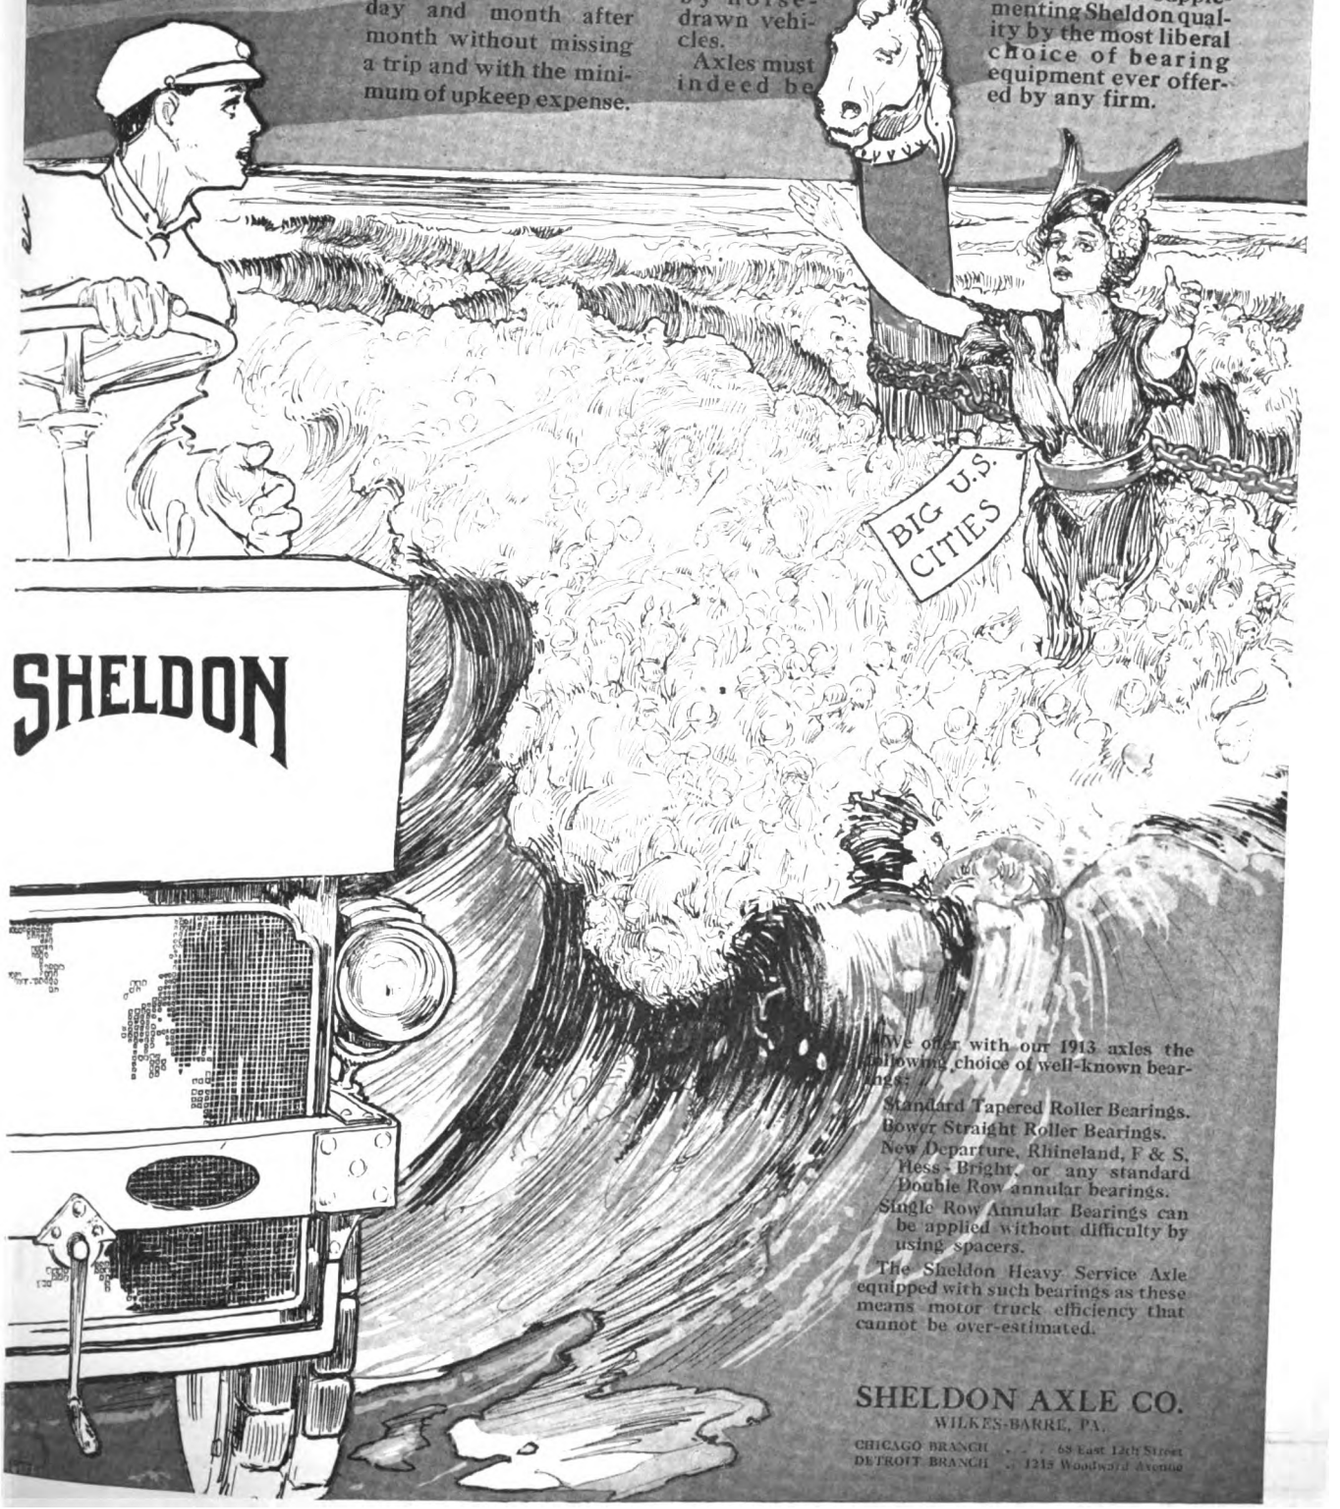
Almost Lost in the Tide of Traffic!!

SHELDON TO THE RESCUE



The substitution of motor trucks for horse delivery in our large cities has been made practicable by the flawless construction and the great serviceability of Sheldon Axles and Springs.

Wherever Sheldon Heavy Service Axles and Springs are used, you will find trucks making their deliveries day after day and month after month without missing a trip and with the minimum of upkeep expense.

It is this reliability and high efficiency of Sheldon equipped trucks that have relieved the larger cities of our country from much of the congestion and disasters attending heavy delivery by horse-drawn vehicles.

Axles must indeed be well made and perfectly equipped to accomplish such a revolutionary feat.

The public is well acquainted with Sheldon design and construction, and we are now supplementing Sheldon quality by the most liberal choice of bearing equipment ever offered by any firm.

We offer with our 1913 axles the following choice of well-known bearings:

Standard Tapered Roller Bearings.
Bower Straight Roller Bearings.
New Departure, Rhineland, F & S, Hess-Bright, or any standard Double Row annular bearings.
Single Row Annular Bearings can be applied without difficulty by using spacers.

The Sheldon Heavy Service Axle equipped with such bearings as these means motor truck efficiency that cannot be over-estimated.

For The Hurry Call!

For the race with the stork, whether by day or by night, when there is something to be delivered P. D. Q., in town or country, though streets be crowded and roads be rough, the doctor must have a car that he can depend on. He can take no chances with a motor of spasmodic performance. He must *get there* and get there quickly.

There is no motor that gives such uniformly reliable service for the doctor's car as

THE RUTENBER MOTOR

It is built for precisely this kind of use. It is always ready, always in running order, always dependable. Rough roads and bad weather have no terrors for the doctor whose car is equipped with the redoubtable Rutenber. When speed is required it will run like a deer. It does not falter or hesitate. It does not jar out of adjustment. It does not heat up under hard driving or require an expert to keep it in order.

Model R. A. Sta. Magneto side

More than a score of the best selling cars in America carry Rutenber Motors in their 1913 models.

The Rutenber Motor will give to *your* car the element of reliability that is fundamental to successful automobile construction; and will solve your motor troubles and assure to your product an unfailing market.

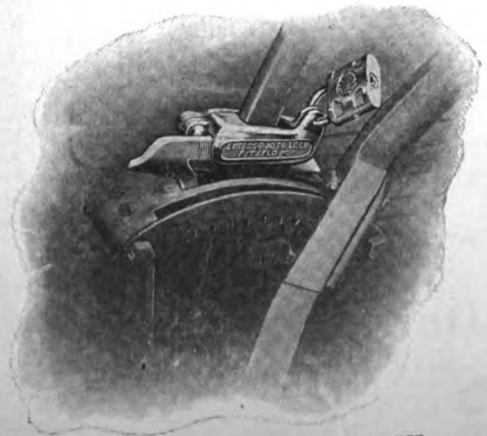
Penn Springs

Penn Spring Works



BALDWINSVILLE
NEW YORK

PENN SPRINGS are tested for resiliency and tensile strength far beyond any point that could be reached in every day service. They are guaranteed against fatigue and through the special grades of steel and methods of construction they will give service "plus."

Car manufacturers can make our engineering force part of their organization in the work of producing springs that are true in even load carrying, resilient and engineered to fit the particular car for which they are designed.

Protect Your Car with a Bulldog

BULL DOG AUTO LOCK

Progressive Dealers

will be alive to the sales possibilities of this device, which is by long odds the best insurance against theft, joy riding and meddlers generally.

The Bull Dog Auto Lock is one of the necessities that is "a little worker with a big mission to perform," and to see it is to want it. Dealers have proved this by the number of sales they have made and are making.

This safety device is simple in construction, easy to attach and detach, neat in appearance, and has the tenacity of a bull dog. It will fit all modern cars that have a sliding gear transmission.

Write and get our proposition to you. The retail price is $2.50, small enough to make sales come easy and large enough to give you a liberal commission.

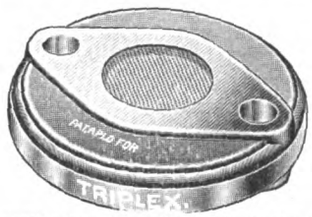
Remy Magneto
Chosen by America's Leading Manufacturers

More Remy Magnetos are being used on 1913 American Automobiles than all other makes combined.

Our contracted sales for 1913 are Five Times Greater than in 1912.

We ship over 13,000 Remys monthly.

This is an expression of the confidence of this country's foremost manufacturers in Remy Magnetos and the facilities of the Remy plant in Anderson, Indiana.



See that a new Remy is on the car you buy.

Exchange your old magneto (any make) for a new 1913 Remy; it will cost you practically no more than repairs on your present ignition system.

TRIPLEX

A FUEL SAVER and A MONEY SAVER

Increases Power Decreases Cost

The Triplex is a device placed between the manifold and the carburetor to break up the mixture. No matter how imperfectly the carburetor does its work, the Triplex equalizes the mixture, producing an explosive gas of even, uniform quality that will burn clean to the last atom. This means that the user gets all the power all the time—that every fraction of energy to be obtained from the gasoline is produced and used. There is absolutely no waste. High proof gasoline is made out of low, and over 25% is saved on every gallon. For further information write us.

BENZ

Since the introduction of BENZ cars to the motoring public of America no car has attained such world-wide supremacy as to its construction, standing up quality, and material. The new type of 35 and 50 H. P. BENZ models are the last word in automobile construction.

The noticeable features of this type of BENZ cars include the offset crank shaft, smokeless oiler, and SILENT CHAINS instead of timing gears.

The BENZ Carrosseries are noted for their beautiful lines and thorough comfort.

To those desiring AGENCY of this car the Benz Company will offer special terms. We want RELIABLE, ENERGETIC agents to further our interests for both BENZ pleasure cars and BENZ-GAGGENAU trucks, which today stand recognized by those who know, as the leading 6-ton truck. Wire or write us, no matter where you are.

Our PRICES compete with LEADING AMERICAN makes.

Tire Resistance to Decay

can be increased at least 30 per cent. by the use of Tirenew and Narco Cut Fller.

TIRENEW is a liquid, unvulcanized, rubber compound — waterproofs and protects the inner fabric from decay.

Makes Tires Look Like New

Narco
TIRE CUT FILLER

a self-vulcanizing, combination rubber cement, cut filler and mastic. Fills cuts and puncture holes—heals over night—becomes like part of the tire. $1.00 a tube. Dealers—Car Owners—Send $1.00 for a trial can of Tirenew—contains enough for 10 tires.

National Rubber Co., 4413 Narco Bldg., St. Louis, Mo.

INTERLOCK INNER TIRES
Stop Tire Troubles

The one weak point of the automobile is that you cannot depend on the tires. Thousands of motorists have solved their tire problem by discarding inner shoes, reliners, fillers and other makeshifts and equipping their tires with **Interlock Inner Tires.**

Interlocks are complete inner tires (not inner shoes) placed between the outer casing and inner tube to strengthen the casing and protect the tube from punctures. They double the mileage of new tires and add 1,000 to 5,000 miles to old ones—save half your tire expense—and make tires trouble proof.

Dealers and Motorists—Investigate Interlocks

Don't delay—write now for booklets, data, prices, testimonials of users, road tests, etc. Mention size and kind of tires you use.

DOUBLE FABRIC TIRE CO. 600 W. 9th Street, Auburn, Indiana

70% More Tire Miles

WIRE McCUE WHEELS

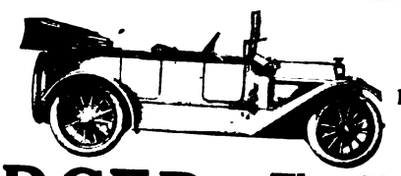
Another Victory for Staver

Staver 55 was the only touring car to finish the exacting "Round Lake Michigan" reliability run with a perfect score—repeating its victory in the contest of the preceding year.



Larger Output—Three Splendid Models

For 1913, we are concentrating on three great models—Staver 55, Staver 45 (our competition crushing forty), and our big Staver Six.

Staver cars are roomy, luxuriously upholstered, up to the minute in equipment. Backed by Staver durability, they are the biggest value on the market.

Dollar-Getters for your Workbench

Garage and Repair Men:

IF you don't repair tires you're neglecting a most profitable opportunity. You have an established trade with the people who have tire trouble. They'd rather have you mend their punctures and blow-outs than to have you send them to a tire-repairing plant.

A tire repair outfit will pay you big profits. It's a money maker for you as well as a convenience to your customers.

SHALER Vulcanizers

The workbench outfit shown above will handle every practicable kind of tire repairing—tube punctures to casing blow-outs. Each part is independent of the others; that is, you can start with one model of the Shaler line and increase as your work increases.

Heat comes from the most convenient source, electric current. Simply plug into any lighting socket. The vulcanizer heats while you prepare the repair—no smoke—no danger of fire. An **automatic temperature control** regulates the amount of current, so that the vulcanizer is held at the vulcanizing degree indefinitely. Anybody can make perfect repairs with the Shaler. We furnish instructions that anyone can understand and follow.

We also have a complete line of steam and electric vulcanizers for garages and motorists who do not have access to electric current.

Send the Coupon Today

You'll get a complimentary copy of our famous booklet, "Common Sense About Tire Repairs." Contains a lot of valuable pointers for the wide-awake garage man.

C. A. SHALER COMPANY

Detroit Electric Coupe
Equipped with
Hess-Bright Ball Bearings

"Other Things Being Equal, The Polish is the Ball"

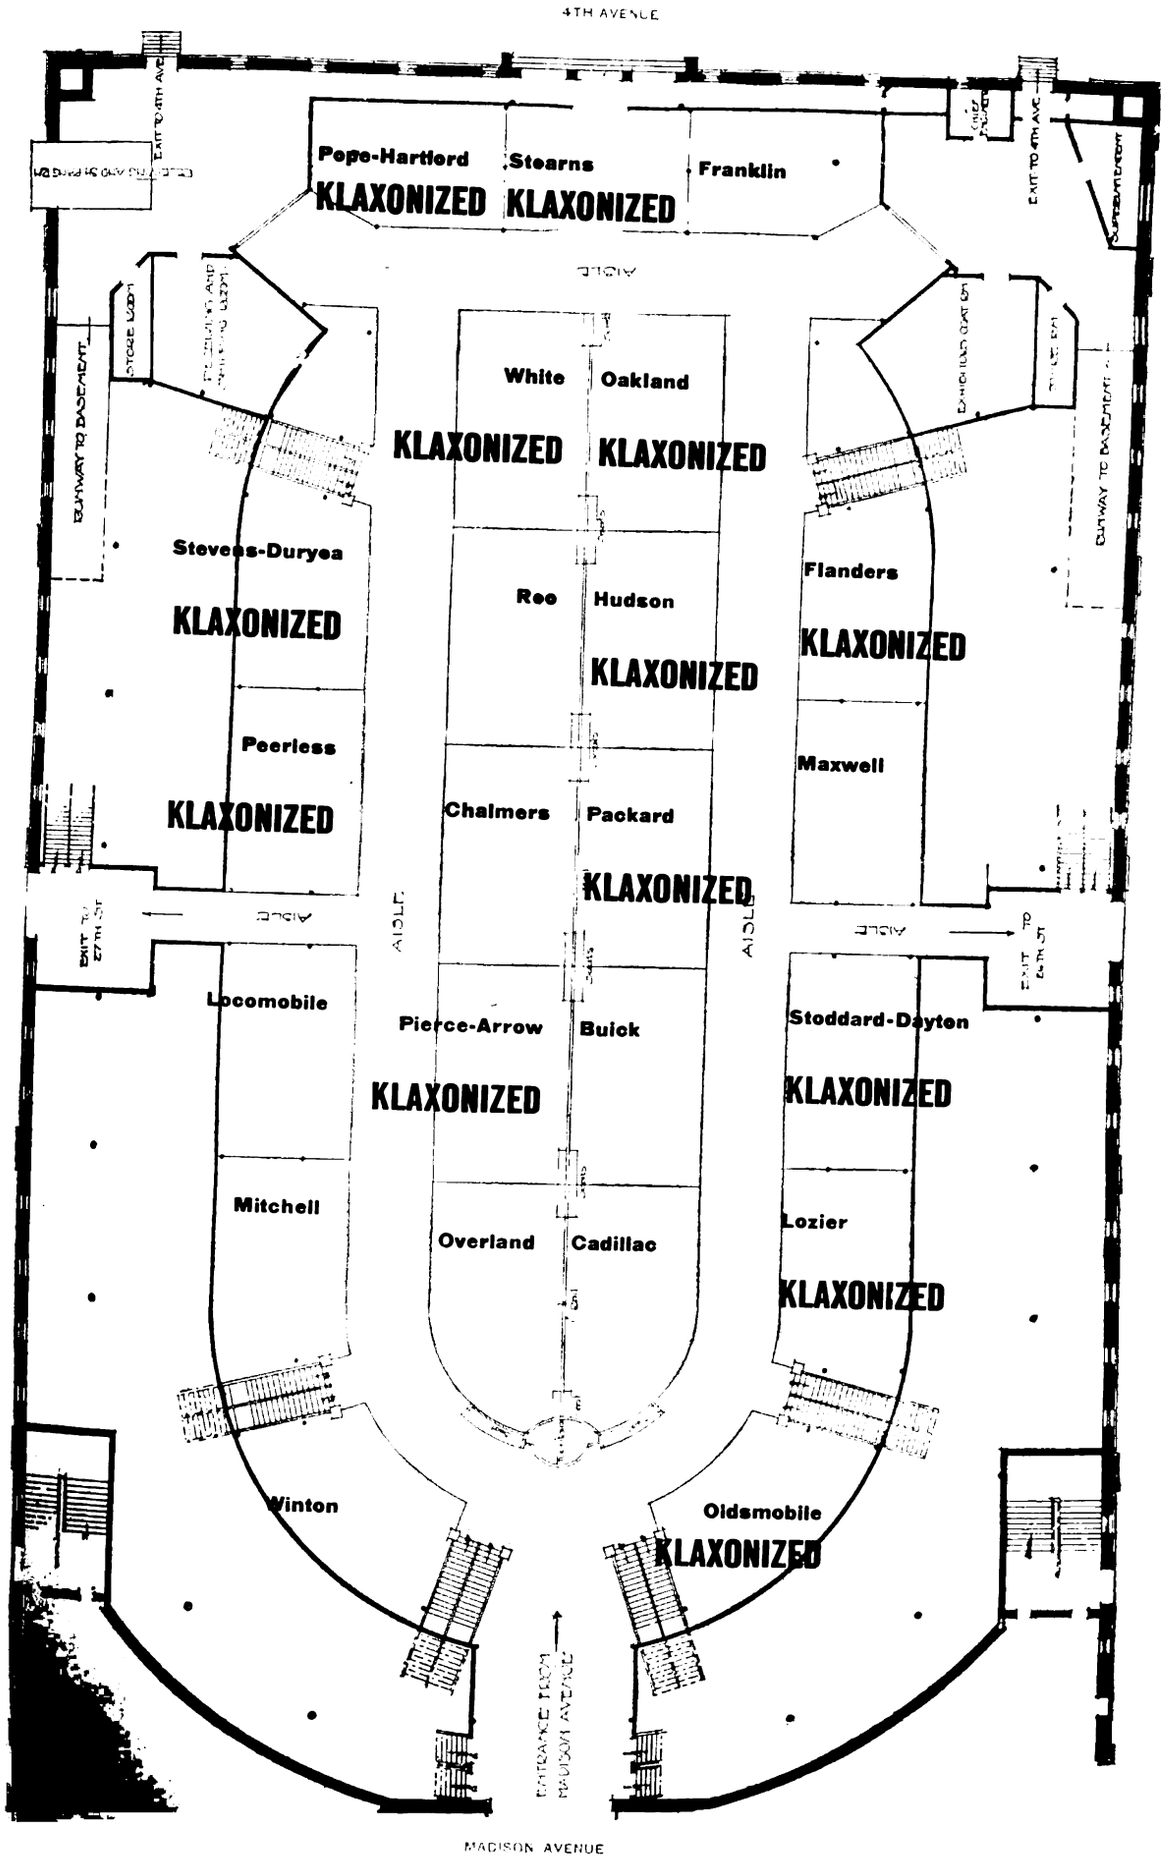
The most heavily stressed portions of a loaded ball are the points of contact. These points flatten microscopically, so that they are in reality areas, not points.

If these contact areas are smooth, their whole surface is brought into action. If they are rough, the load that should be distributed over the whole surface is concentrated on the microscopic high spots, which are correspondingly overloaded.

These overloaded high spots do not wear smooth beyond a certain point; their tendency is to wear rough or flake out.

In an anti-friction bearing, it is only the first thousandth of an inch or so of surface that really counts for wear. After that first polish is gone the surface crumbles quickly. Other things being equal, the smoothest ball and smoothest race are the longest lived.

Hess-Bright balls and races receive a mirror-like final polish after they have been brought by grinding to perfection of form and size. Under the strongest pocket magnifier their surface remains smooth. When they are properly mounted and protected from dirt and corrosion, wear in the ordinary sense is absent, because there is no friction to cause wear.



Because Hess-Bright bearings are free from wear, it is practicable to protect them by closures far more effective than those that can be used with bearings subject to wear. Dirt and water can be excluded and the lubricant retained indefinitely. These closures insure to the user the full measure of durability to which the high quality of Hess-Bright Ball Bearings entitles him.

Our booklet, "Ball Bearings That Endure—And Why," tells more. Sent free to any address on request

Studebaker

A Studebaker "25" at $885 Sells Itself

It isn't necessary for a Studebaker Dealer to worry over selling talk.

Show a prospective customer a Studebaker "25" and watch him reach for his check-book.

The mechanical perfection of the motor; the simplicity of the chassis, the full elliptic springs, semi-floating rear axle and irreversible steering gear appeal to the man who knows the good points of a motor car.

The pleasing cowl design of the body, the comfortable fullness of the tonneau, with the fine upholstery, deep cushions, Studebaker jiffy curtains, electric horn—in fact the unusual richness and completeness of the Studebaker "25"—make it the easiest seller in motordom.

And no other car in the market is made under such favorable conditions. The Studebaker "25" is made by the same skilled experts, of the same tested materials and in the same plant as is the Studebaker "35" and the Studebaker "Six."

In roadability, appearance and ability to go anywhere, under any circumstance the Studebaker "25" is in a distinctive class by itself.

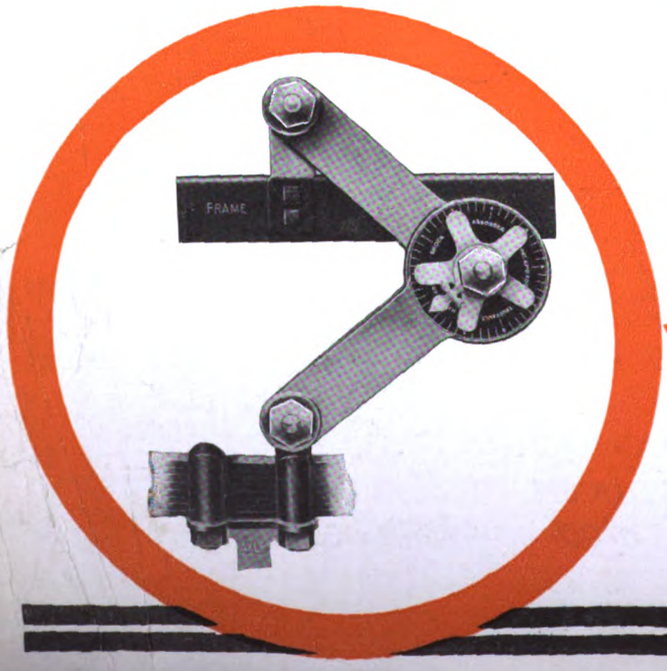
Truffault-Hartford
SHOCK ABSORBER



Increased Sales for YOU

---if the car YOU sell is Truffault-Hartford equipped.

Your interests are best served when you can meet the demand of owners for Truffault-Hartford equipment on the cars they buy.

Leading manufacturers---producing 27 popular cars---recognize the insistence of the demand for this necessary device. THEY equip their cars with Truffault-Hartfords---at the factory.

Does the manufacturer you represent recognize this demand? Truffault-Hartford equipment---on any car---enhances its value as a car and a selling proposition. Insist that your manufacturer includes Truffault-Hartfords on the car you sell. It means increased sales for you.

'The World Moves Easier
When Mounted On

R·I·V BALLBEARINGS

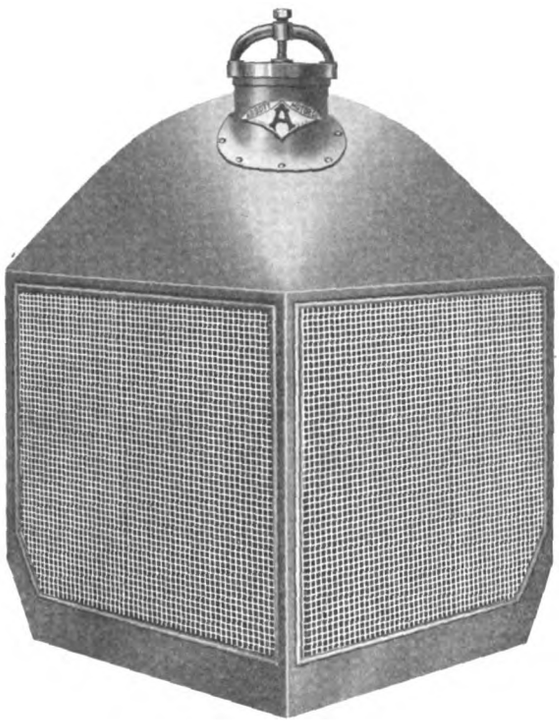
DEALERS

Bearings of Recognized Worth are Ear Marks of Car Quality

DEALERS

Are the Cars You Represent R.I.V. Equipped?

R. I. V. standing in the field is due to the unique accuracy of the bearings as a whole and to the superior hardness and tensile strength of the balls and races as well as the *substantial* construction of the retainers.



The R. I. V. guarantee of accuracy is absolute. Consistent and constant tests maintain it and even under the heaviest loads these bearings revolve with unusual celerity but minus excessive side play.

Conservative manufacturers equip their cars with R. I. V. Ball Bearings.

Fedders Radiators

The square tube radiator is acknowledged to be superior to any other form of construction and Fedders design and methods of manufacture give Fedders radiators a standing second to none in the field.

Fedders Square Tube Radiators offer a maximum of radiating surface — all four sides are surrounded by water—cannot clog and can be repaired in short order by any tinsmith.

While we specialize on square tube types, we are also equipped to build on any specifications that may be furnished. Send us blue prints and our engineering department is at your disposal for co-operative work.

The Atwater Kent Ignition System

Time was when automobile engineers and the general motoring public thought they must equip their cars with a magneto. Today this idea is fast waning—in fact, it has been discarded by many of the foremost automobile engineers and discriminating motorists who are now demanding a more dependable source of current on their cars.

The increasing use of electric lighting and starting equipment necessitates an ignition system better than the magneto—a system producing a uniformly hot spark at low speeds as well as high—a system giving a hot starting spark with the motor at a standstill—a system that is simple in principle and mechanism as well as in operation, and reasonable in initial and maintenance cost—in brief, a system of ignition that will measure up to the highest requirements of the most modern automobile practice.

Such is the Atwater Kent Ignition System—embodying the best features of both magneto and battery, without the weaknesses of either.

Remember the Atwater Kent System can be easily and quickly installed on any standard make of motor, new or old, without the price of a magneto.

If you have an unsatisfactory magneto, or if your motor is not equipped with a half time shaft, you can use the Atwater Kent System by means of our magneto gear mounting, the cost of which is nominal.

In addition to our standard Type F System, we are marketing a new model—Silent Type K with automatic spark control and insulated primary circuit.

Whether you are interested in motor cars as manufacturer, dealer, owner, or prospective buyer, you should have a copy of our booklet "D." It covers the subject authoritatively and thoroughly and even the most experienced will find it interesting reading.

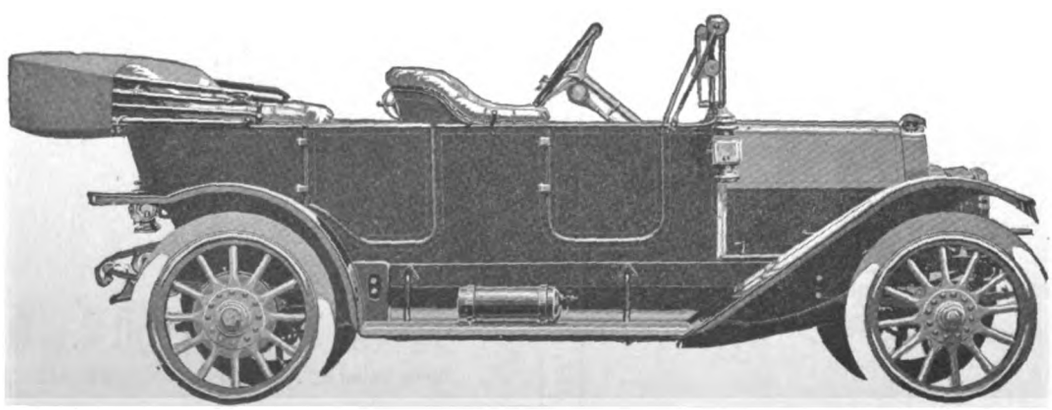
High-Priced Feature No. 13

Overland 69T bodies pass through 22 painting, rubbing and varnishing operations.

The Model 69T boasts a metal unbreakable body which can not shrink or warp. The non-porous surface allows the most brilliant, mirror-like finish.

Each radiator receives four coats of separately baked enamel. Fenders, windshield, dust pans, lamp brackets, top irons, hoods, etc., are treated likewise.



Wheels are painted with compressed air brushes. This drives the pigment into the pores—guarding against moisture.

All bright parts of the Model 69T are heavily nickeled.

This car's beauty and finish is the equal of any $1200 car made.

Write today for literature. Please address Dept. 50.

MOTOR WORLD

Vol. XXXIV New York, U. S. A., Thursday, January 30, 1913 No. 6

MAXWELL PREPARES TO TEST RIGHT TO USE OF HIS NAME

Quietly Organizes His Own Car-Building Company and Challenge Is Plain—Project Is Distinct from Briscoe's.

Before the purchasers and reorganizers of the United States Motor Co. obtain a clear title to the name Maxwell Motor Co., which they have selected for the reorganized establishment, after Standard Motor Co. was discarded, they probably will have to fight for it. For J. D. Maxwell himself has organized and incorporated under New York laws the J. D. Maxwell Motor Corporation, and while he does not say in exact language that he proposes to test the right of the reorganizers to use his name, he did say to a Motor World man that he intends to discover exactly what rights he has in the premises, which amounts to about the same thing.

He admits that the reorganizers of the United States Motor Co., which originally was built around the Maxwell-Briscoe corporation, are entitled to employ the hyphenated Maxwell-Briscoe name if they elect to do so, and also to use the name Maxwell as applied to motor vehicles, but his conversation made very plain that he doubts their right to use the name Maxwell as the title of their new corporation.

Mr. Maxwell has been rather quiet since the failure of the big company in September last, which swept away most of the handsome fortune which he had built up after years of industry, and is not quite ready to make public the details of the newly organized J. D. Maxwell Motor Corporation, which is capitalized at the nominal sum of $10,000. He admits that it is his purpose to manufacture a car, and that several men of means and influence probably will be associated with him; but more than this he will not say at this time. He made clear, however, that his old associate, Benjamin Briscoe, is not and will not be identified with the J. D. Maxwell Motor Corporation, which is separate and distinct from the new company which Briscoe will organize to manufacture the under-$1,000 car which he is now developing in Europe.

Settles $300,000 Suit Against Michelin.

The differences which a year and a half ago caused Frans Poel and Charles H. Arnold, New York rubber brokers, to file suit for $300,000 against the Michelin Tire Co., of Milltown, N. J., in the Supreme Court for New York county, have been settled out of court and the several actions have been formally discontinued. The trouble arose from contracts which the Michelin company made with the brokers for crude rubber, the Poel-Arnold contention being that the Michelin company declined to take the rubber it had ordered, while Michelin questioned the quality. Changes in the price of crude rubber also had to do with the case, the price of rubber taking a decided drop after the Michelin company made its contracts.

John Splitdorf to Re-enter Business.

John M. Splitdorf, who disposed of his interests in Chas. F. Splitdorf, Inc., when the latter was taken over in May last by the Splitdorf Electrical Co. of Newark, N. J., and became one of John F. Alvord's enterprises, is preparing to re-embark in the business. He has designed an electric starter and lighter, which is said to incorporate uncommon ingenuity, and already has opened an office at 136 West 52nd street, New York. It is probable that a company will be built around the device. A. L. Kull, one of the veterans of the industry, and E. LeRoy Pelletier are among those interested with Splitdorf in the enterprise.

Willys Sails for Long Tour Abroad.

John N. Willys, president of the Willys-Overland Co., sails to-day for an extended tour of the "other side" which will reach into Egypt. He will be absent about three months.

TIRE MAKERS DRAW LINES TIGHTER ON GUARANTEES

Adopt New Form That Is Far Reaching and More Specific—Mileages and Tire Fillers Both Tabooed.

While the tire manufacturers who are included in the membership of the Motor and Accessory Manufacturers were in New York for the purpose of attending the show, they made use of the occasion completely to overhaul and revise the guarantee which hitherto has applied to their productions, or, at any rate, to their pneumatic tires. The revision had been in the hands of a committee for some time, and as finally adopted is far-reaching and so specific as to leave little to be misunderstood. It is as follows:

"We guarantee all pneumatic automobile tires, bearing our name and serial number, to be free from imperfections in material and workmanship. Tires returned for consideration under this guarantee will be accepted only when all transportation charges are prepaid. If, upon examination, it is our judgment that tires are defective, they will be repaired or replaced at our option.

"When tires are replaced by us, charges will be made to owners at the time new tires are delivered, for such amounts as in our judgment will compensate for the service rendered by such replaced tires.

"Tires worn out in usual or unusual service, abused knowingly or unknowingly, misused, used on rims not bearing these stamps ————, injured through accident or design are not covered by this guarantee.

"———— pneumatic automobile tires are not guaranteed to give any definite miles of service, and any and all guarantees are expressly waived by any purchaser of these tires who uses therein any substitute for air; or who uses them under weights in excess of those for which the various tires are recommended, or who does not keep tires inflated to the pressures recommended."

"PROTECTIVE" PROMOTER GETS LONG TERM IN PRISON

Sponsor of Chicago's "National Association" Proves To Be Man With Unsavory Record — Forgery His Chief Profession.

Due to the arrest and exposure of the man responsible for its creation, William J. Reid, a blight has fallen on the National Automobile Protective Association, which, in October last, established an office in the Steger building in Chicago, and which more or less amusingly proposed to "protect" or dominate or otherwise do things to or for the garage business of the United States.

The Reid company styled itself the general agent of the so-called association, but although Reid himself professed to be a real estate broker, and the Reid company to be engaged in the real estate brokerage business, the line between it and the association was an almost invisible one.

Reid was arrested in Sanger, Cal., where he called to draw against a draft for $15,000 which he had deposited and where a trap had been laid for him. After his arrest it came out that he had spent nine years in prison, having been arrested first in his native city, Rockford, Ill., in 1895, where he was charged with arson. After the jury disagreed, Reid disappeared and took the name of a Rockford minister, L. A. Hoffman, and apparently started on a career of forgery which extended practically from ocean to ocean and which entailed the use of many names. He has "done time" in prisons as far removed as California and Massachusetts.

When, under his correct name, he opened up in Chicago and undertook the exploitation of the National Automobile Protective Association, his intimates in that project apparently knew nothing of his career and were genuinely amazed at the disclosures which followed Reid's arrest.

When apprehended in California, he wore a red wig, false whiskers and two complete sets of clothes, and in his baggage were found four other disguises and a small printing press, which, it is stated, was used to print cards and letterheads to meet his various emergencies.

The purpose of the National Protective Association, which, like those of many similar organizations which preceded it and all of which came to naught, was to get $25 from dealers and garagemen and $10 from car owners, the pet theory being that the car-owning "member" could be guided into the "association's" garages, where he would leave a share of his coin, while, in turn, the garage would grant more or less special rates and service, and the result would be beneficial all around.

Reid provided the garages with handsome gold-trimmed certificates and outlined a code of standards to which they must adhere. If they failed to adhere to them, or in towns where garages did not meet the Reid "standard," the association grandiloquently announced its intention of building garages of its own.

When his "protective" scheme reached the gold certificate stage, Reid tendered practically all of the automobile publications contracts for 52 pages of advertising, which most of them accepted, and in due course the advertisements of the association appeared in spread-eagle type. One of the contracts was tendered Motor World, but before accepting it a series of questions concerning the internal make-up of the "association" and the previous connections of those who comprised it were submitted to the Reid company. The questions never were answered, and the association's advertisements never appeared in the pages of Motor World.

Pelletier Rejoins the Flanders Camp.

E. LeRoy Pelletier, after all, has accepted the post of advertising counsel for the Maxwell Motor Co., acting through the Campbell-Ewald Advertising Agency, to which he has become attached. The strained relations which existed between himself and his "one best bet," W. E. Flanders, president and general manager of the Maxwell Motor Co., as the result of a Christmas spat, have been relieved and Pelletier has ceased to call Flanders a "paper man," and the two now talk almost as kindly of each other as they did in the days of yore. Pelletier, however, will not devote all of his service to the Maxwell interests. He will also handle the advertising of the new electrical company which is being organized by John M. Splitdorf, and it is understood that in all probability he will likewise have charge of the advertising account of one of the largest tire companies.

Pioneer Dealer Makes an Assignment.

The K. A. Skinner Co., of Boston, Mass., has made an assignment for the benefit of its creditors to Clarence F. Newton. Although comparatively few tradesmen are aware of the fact, Kenneth A. Skinner, who practically comprises the embarrassed company, was one of the first, if not the first, man to engage exclusively in the retail sale of motor vehicles in this country. As long ago as 1897 he was importing De Dion tricycles and motorettes. At that time he established a store on Massachusetts avenue, in Boston, his chief source of income being receipts from rental fees and his chief patrons Harvard students.

FORECLOSURE OF MORTGAGE COMPLICATES ATLAS'S DEAL

Bank Forces Sale of Springfield Car Company's Plant Regardless of Orson Negotiations—One Loophole Still Open.

The affairs of the Atlas Motor Car Co., of Springfield, Mass., which has been in a questionable state for several months, took a sudden and unexpected turn on Saturday last when the Union Trust Co., of that city, foreclosed a second mortgage for $19,400 which it held. The public sale which followed resulted in the purchase of the Atlas plant by Charles D. Whitney, manager of the Victor Sporting Goods Co., of Springfield. The price paid was $55,000. In addition to the second mortgage which precipitated the trouble, a first mortgage of $30,000 was held by the Hampden Savings Bank.

The Atlas company has been very much hampered by lack of capital and the failure of the Atlas Engine Works of Indianapolis last summer added greatly to its embarrassment, the supply of Atlas-Knight engines for which it had contracted being suddenly cut off.

The foreclosure proceedings will serve to complicate negotiations which were in progerss between the Atlas Motor Car Co. and the promoters of the so-called Orson merger, in which the Brightwood Motor Mfg. Co. and the Springfield Metal Body Co. are the chief factors. The Atlas company hoped to be included in that project and hope has not been entirely abandoned, as, if satisfactory arrangements can be made, it is probable that the Atlas plant can be re-purchased from the Victor Sporting Goods people, who acquired it on Saturday last.

Oil Account Causes Legal Friction.

A bill of $85.57 for goods figures in a suit filed this week in the Supreme Court for New York county by the New York Lubricating Oil Co. against Herbert A. Clouse, who trades as the New York Garage & Supply Co., in Mt. Vernon, N. Y. The account accumulated between July 31 and October 15, 1912, and the claim is made that but $25 was paid on the total, leaving a balance of $60.57.

South Americans Secure Stewart Trucks.

Pratt & Co. of Buenos Aires, Argentina, who have handled American goods at various times for many years, have taken on the sale of Stewart motor trucks, after having the market investigated by a personal representative. The first two trucks already are en route to Buenos Aires.

WEED GUARANTEES DIVIDENDS ON AMERICAN CHAIN SHARES

Offer of American Stock Discloses Little Known Relationship — Also Makes Plain Some of Weed's Extensive Plans.

In offering to the public the American Chain Co.'s issue of $250,000 7 per cent. cumulative preferred stock, some additional and hitherto unknown particulars of that company have become common property.

The American Chain Co. itself was organized in December last, with an authorized capital of $750,000, to take over the chain business of the Oneida Community, Ltd., in Sherill, N. Y., which in June, 1912, had been purchased for $316,000 cash by W. B. Lasher, president of the Weed Chain Tire Grip Co.

It now transpires that, excepting only the qualifying shares of directors, Lasher owns all of the Weed shares, and the Weed company, in turn, owns all except the directors' qualifying shares of the American Chain Co., which is and will continue to be the source of supply for the Weed company. Its production of Weed chains, however, amounts only to about 25 per cent. of its total business, its present plant having a capacity for more than 300,000 feet of chain per day. In addition, plans are now under way for the acquisition of another palnt, probably in Bridgeport, Conn., where the Weed company itself is located.

Furthermore, and as was indicated by Motor World several weeks since, the Weed company now is negotiating with the British Parsons Co. on a basis which practically will amount to a consolidation of the Weed and the Parsons companies and which will result in the employment abroad of the same vigorous methods which have built up the Weed business in America to such handsome proportions.

All of the common stock of the American Chain Co. is in the Weed treasury, the 7 per cent. dividend on the preferred shares which are being offered to the public guaranteed for 10 years by the Weed company, whose profits, it is stated, have averaged at least 10 times the entire dividend required for the preferred stock of the American company.

During the six months, to December 15th, in which Lasher has owned the latter, its gross receipts have amounted to $202,745 and the cost of manufacturing to $117,024, its balance, after meeting all other expenses and including undivided profits—$57,435—being $47,956.

The total assets of the American Chain Co. are $820,084, of which $43,378 is represented by good-will, patents, etc., and $225,061 by machinery and equipment.

The American Chain preferred is offered at par and dividend and is redeemable until January 1, 1918, at 110 and accumulated dividends, a sinking fund of one-half of the earnings of the company in excess of 10 per cent. dividends on its common stock being provided for the retirement of the preferred.

Lynn Show Leads Dealers into Court.

Because the Lynn (Mass.) show, which closed on Saturday last, was held in the local armory instead of in the garage of L. D. Robbins, where it was held last year and where it first was to be staged on this occasion, a fine little tempest in a teapot has arisen and found its way into court. L. D. Robbins, the owner of the garage involved, is a former president of the Lynn Automobile Dealers' Association, and with Winthrop W. Whitney he has instituted suit against five other men who had to do with the show, and it is intimated that the litigation has just begun. Robbins claims to have expended $80 in preparing his garage for the show and is suing for the amount of the bill. He names as defendants William H. Bennett, Warren H. Beede, Stephen R. Tierney, Frank Plumstead and Fred H. Plumstead.

Fireball Appeals to Highest Court.

Following the recent decision by the United States Circuit Court of Appeals, in the suit of the Prest-O-Lite Co. against the Searchlight Gas Co., that the Claude and Hess patent, No. 664,383, under which the former brought suit, had expired, the Fireball Gas Tank & Illuminating Co., of St. Louis, has asked permission to appeal to the United States Supreme Court from an order of the Circuit Court of Appeals for the Eighth Circuit, made in September, upholding a preliminary injunction granted to the Prest-O-Lite Co. in the District Court. The Fireball company in its petition for a writ of certiorari includes the statement that a Circuit Court has just overthrown the patent. Because of the infrequency of favorable action on requests to appeal in patent litigation, the unusual is not anticipated in this instance.

National-Acme Cuts Second Melon.

The National-Acme Mfg. Co. of Cleveland, O., manufacturers of automatic screw machines and their products, which is closely identified with the automobile industry because of its many automobile plants, has declared a stock dividend of 33 1/3 per cent., payable out of the treasury. It is the second melon which the company has cut within a period of two years. In 1911, when it increased its capital from $1,500,000 to $2,500,000, it paid a 20 per cent. stock dividend.

U. S. MOTOR REORGANIZERS BLOCKED BY INDIANANS

Secure Order Restraining Possession of Maxwell Property—Reorganization Plans Undergo Changes—May Drop Stoddard-Dayton.

Despite the sale on January 8th of the United States Motor Co. to the reorganization committee, the reorganizers are not yet in full possession of all of the property. There remain several knots to be unravelled, the hardest of which apparently grows out of the action of the Indiana creditors of of the Maxwell-Briscoe Motor Co. who sought to have the Maxwell plant in New Castle, Ind., thrown into bankruptcy.

Notwithstanding the bankruptcy petition which was pending at the time, the New Castle property was included in the sale authorized by the Federal court in New York, and J. W. Wellington, whom the reorganizers had appointed manager of the plant, actually had taken possession, replacing Frank E. Smith, the former manager, who also had been acting as receiver for the Indiana property.

Wellington's possession of the property was short-lived, however, as on Thursday last the Indiana creditors secured from Judge Anderson, in the Federal court in Indianapolis, a restraining order preventing the receivers of the Maxwell-Briscoe Motor Co. from turning over the property to those who were termed the "alleged purchasers." The restraining order also includes the Maxwell factory at Tarrytown, N. Y. Smith, therefore, resumed control of the New Castle plant as receiver, and W. E. Strong and Roberts Walker remain receivers of the Tarrytown plant until the knot is untied.

Even in Indiana there were those who supposed that the action of the Federal Court in New York approving the sale of the property terminated the bankruptcy proceedings in Indiana, and the action of Judge Anderson was, therefore, in the nature of no mild surprise.

The bankruptcy petition will be heard next week, at which time the reorganization committee will, of course, oppose it. Meanwhile, however, the tardy petition in bankruptcy filed by three minor creditors against the United States Motor Co. itself in the United States court in New Jersey has been dismissed, but the minority stockholders of the Columbia Motor Car Co. who were denied the right to intervene in the receivership proceedings in New York are pressing their case. They are represented by Attorney Edo E. Mercelis, who has perfected their appeal, which will be heard next month.

Digitized by Google

The plans of the reorganizers are but slowly unfolding and, according to usually reliable sources, they have undergone a considerable change since first outlined. At that time, it was given out that the Maxwell and the Stoddard-Dayton cars would be the only cars continued, and it was not wholly a state secret that the manufacture of the Columbia would be abandoned and the Columbia factory in Hartford be devoted to the manufacture of parts. According to later reports, however, it has been decided to discontinue the Stoddard-Dayton and not only to continue the production of the Columbia but to do so through the medium of a separate company, which will continue to bear the style Columbia Motor Car Co. and which will continue the higher priced Knight-engined cars.

As the Stoddard interests were rarely at peace with the others in the United States Motor Co., it appears not improbable that disinclination to continue the use of the name Stoddard in any way has to do with the case. However, Henry V. Poor, chief counsel for the reorganization committee, stated to a Motor World man this week that if it is the intention to continue the Columbia Motor Car Co. as a separate corporation, or in any other way, he was not aware of the fact; and he smiled his usual cheerful smile when he said it.

Walter E. Flanders, the president of the reorganized company, and W. F. McGuire, the vice-president, have been making the rounds of the several properties, and while in Dayton last week are quoted as saying that the high-priced cars will be made in Hartford and the lower priced cars in Dayton and Detroit. Replacement parts will be made in the New Castle (Ind.) plant when the expected possession of it is acquired, but the original Maxwell plant in Tarrytown, N. Y., will be discontinued, as was already known would be the case. It has remained idle ever since the failure of the United States Motor Co. in September last.

Jones and Precision End Litigation.

Although when the Jones Taximeter Co., of New York City, filed a suit in the Supreme Court for New York county in October last against the Precision Tool & Instrument Co., also of New York City, it claimed all attempts at arbitrating the dispute in question had failed, some sort of arbitration finally appears to have been effected, for the action has been discontinued. The Jones company alleged that the Precision company agreed to build 3,000 Jones speedometers and that the transaction resulted in a financial difference of $7,503.33 in favor of Jones, which account was disputed and baffled all attempts at peaceable settlement.

OAKLAND SUED BY SHEPHERD AND SHEPHERD COMPANY, TOO

Former New York Dealer Claims Damages Through Business Dealings—Agency Head Claims Injuries from Flywheel.

Not only has Irving R. Shepherd, the president of the Shepherd Motor Car Co., of New York City, sued the Oakland Motor Car Co., of Pontiac, Mich., for which the Shepherd company once was dealer, but last week the Shepherd company brought a suit of its own in the Supreme Court for New York county against the Oakland company; while Shepherd's personal suit is for injuries caused when an Oakland flywheel burst, the company's suit is the result of disagreements which arose between the manufacturer and the dealer.

The Shepherd company, when it signed up as Oakland dealer about three years ago, was not situated on Broadway, the main thoroughfare in the metropolitan automobile colony, but shortly after the contract was executed the Shepherds moved to Broadway, and state that this was at the request, or insistance, of the Oakland company. The dealership did not progress smoothly, and July 31, 1911, relations were ended. The Shepherds claimed that they had not been treated properly and were entitled to certain money from the Pontiac concern. It was not forthcoming, even after long negotiations, and the suit resulted.

Irving R. Shepherd's action is for $15,000, and to secure jurisdiction over the Michigan corporation the Oakland exhibit at the New York show in Madison Square Garden was attached by the sheriff of New York county, but since this was a mere formality toward securing authority of the court over the Oakland people, the attachment was subsequently released.

Shepherd states that the Oakland flywheel in question was one of a series which were improperly constructed, having three fan-blade spokes instead of a web between the rim and the hub and having holes bored in the rim, all of which, he claims, made the part a dangerous piece of property. He was testing a carburetter March 21, 1910, when the flywheel blew up and he sustained severe injuries, including one of the head which, he claims, was more than temporary. The Shepherd company, in which Irving and a brother are prime movers, recently took over the Selden agency in New York.

Motor Shaft Moves and Changes Name.

Having practically completed its removal from Hastings, Mich., to Jackson, in the same State, the Hastings Motor Shaft Co. has changed its name to the Jackson Motor Shaft Co. At the same time it has elected officers as follows: President, Winthrop Withington; vice-president, F. L. Holmes; secretary, A. E. Mulholland; treasurer, John L. Allen. These officers and L. C. Bloomfield, Fred H. Lewis, H. A. Tompkins, John F. Goodyear and W. W. Potter constitute the board of directors.

Providence Engineering Resumes Business.

One of the several affiliated companies which were brought down by the failure of the United States Motor Co. in September last, the Providence Engineering Co., of Providence, R. I., has straightened out its affairs and secured the discharge of the receiver and restored the property to the stockholders. It is stated that the debt of the United States Motor Co., which caused the engineering company's failure, has been liquidated and that the Engineering company last week repurchased its entire capital stock from the reorganizers of the United States corporation. Business has been resumed with Richard A. Robertson of Providence as president. The other directors of the company are as follows: F. J. Kingsbury, Norman Leeds and James Coulter of Bridgeport, Conn.; V. Everit Macey, William H. Erhart, F. J. Lisman, Richard Irwin and F. Kingsbury Curtis of New York, and Randolph T. Ode of Providence.

Knox to Go Through Bankruptcy.

As the best means of bringing about desired reorganization, the Knox Automobile Co. of Springfield, Mass., which on September 27 last made an assignment, was thrown into bankruptcy last week on the petition of three minor creditors—the Hartford Auto Parts Co., whose claim amounts to $757.35; Samuel Eastman, $38.50, and the Platinide Co., $2.66, the total for all three being but $778.51.

The petition was filed in the Federal court in Boston, which appointed as receivers Harry G. Fisk and Edward O. Sutton, to whom the September assignment was made, and Charles C. Lewis. Negotiations are in progress with New York capitalists who, it is expected, will bring more than sufficient money into the Knox company to put it solidly on its feet, at which time probably it will be renamed Knox Motor Car Co. Meanwhile the factory is operating without interruption.

Michigan Magneto Ceases to Spark.

C. C. Simons has been appointed receiver for the Michigan Magneto Co. of Detroit, Mich., which, however, at no time, cut much of a figure in the trade. Its liabilities are $31,050.26 and its assets $28,415.85. Poor business is given as a reason for the failure of the company.

The Week's Incorporations

Los Angeles, Cal.—Tallyho Garage, under California laws; authorized capital, $50,000; to operate a garage.

Cadillac, Mich.—Wexford-Cadillac Auto Co., under Michigan laws; authorized capital, $20,000; to deal in motor cars.

Quarryville, Pa.—Fairmount Automobile Co., under Pennsylvania laws; authorized capital, $6,000; to deal in motor cars.

Kalamazoo, Mich.—Fuller & Sons Mfg. Co., under Michigan laws; authorized capital, $100,000; to manufacture motor cars.

South Bend, Ind.—South Bend Auto Body Co., under Indiana laws; authorized capital, $20,000; to manufacture motor car bodies.

Pittsburgh, Pa.—Keystone Motor Supply Co., under Pennsylvania laws, authorized capital, $12,000; to deal in motor car supplies.

Rumford, Me.—Rumford Garage, under Maine laws; authorized capital, $50,000; to operate a garage. Corporators—G. W. Pettengill, H. A. Briggs.

Germantown, Pa.—Staybestos Mfg. Co., under Pennsylvania laws; authorized capital, $10,000; to manufactuer brake lining and other asbestos products

Detroit, Mich. — Automobile Laundry, under Michigan laws; authorized capital, $10,000. Corporators—T. I. McCutcheon, H. T. Nelson, F. D. McCormack.

Cleveland, Ohio—Coronet Mfg. Co., under Ohio laws; authorized capital, $60,000; to manufacture speedometers. Corporators—Harry W. Garberson and others.

Boston, Mass.—Donovan Motor Car Co., under Massachusetts laws; authorized capital, $50,000; to deal in motor cars. Corporators—J. S. Donovan, A. D. Adams.

Easton, Pa.—Lafayette Motor Car Co., under Pennsylvania laws; authorized capital, $30,000; to deal in motor cars. Corporators—Robert Fulton and others.

El Reno, Okla.—Martin Motor Co., under Oklahoma laws; authorized capital, $20,000; to deal in motor cars. Corporators—R. D. Martin, W. H. Townsend, F. S. Randall.

Newark, N. J.—J. H. C. Motor Express Co., under New Jersey laws; authorized capital, $25,000; to operate a motor delivery. Corporators—J. B. Furber and others.

Wilmington, Del.—Pullman Taxicab Co., under Delaware laws; authorized capital, $100,000 to deal in motor cars. Corporators—E. C. Boyd, P. L. Garrett, W. A. Joslyn.

Camden, N. J.—Invader Oil Co., under New Jersey laws; authorized capital, $250,000; to manufacture lubricants. Corporators—F. S. Saurman, F. A. Kuntz, F. S. Muzzey.

Chicago, Ill.—Comstock Auto Sales Co., under Ilinois laws; authorized capital, $3,000; to deal in motor cars. Corporators—J. D. Comstock, O. M. Nichols, R. W. Gardner.

East Orange, N. J.—Rickey Machine Co., under New Jersey laws; authorized capital, $125,000; to operate a motor car repair shop. Corporators—M. H. Rickey and others.

Chicago, Ill.—Cutting Motor Co., under Illinois laws; authorized capital, $5,000; to deal in motor cars. Corporators—Nelson W. Mackey, John P. Klein, Eugene C. Mapledoram.

Detroit, Mich.—National Gear Co., under Michigan laws; authorized capital, $1,000; to manufacture motor car parts. Corporators—Thomas J. Hoyt, G. H. Klein, Ralph B. Lacey.

Camden, N. J.—United States Tire Filler Co., under New Jersey laws; authorized capital, $125,000; to manufacture tire filler. Corporators—R. B. Patton, H. E. Patton, H. R. Gorman.

Madison, Wis.—Madison Gasolene Engine Co., under Wisconsin laws; authorized capital, $15,000; to manufacture motors. Corporators—W. C. Bently, J. W. Proctor, A. O. Ledford.

Tulsa, Okla.—Tulsa Spring Wheel Co., under Oklahoma laws; authorized capital, $50,000; to manufacture wheels. Corporators—J. B. Dix Dunlap; Peter R. Deickman W. T. Smith.

Cleveland, Ohio—Universal Accessories Co., under Ohio laws; authorized capital, $5,000; to manufacture motor car accessories. Corporators—Carl Epero, T. W. Rutledge, R. E. Vernes.

Stockton, Cal.—Gill Novelty Co., under California laws; authorized capital, $50,000; to manufacture motor car devices. Corporators—T. J. Gill, W A. Murphy, R. J. Prout, C. M. Gill, J. C. Skinner.

St. Louis, Mo.—Patterson-Abrams Automobile Co., under Missouri laws; authorized capital, $2,000; to deal in motor cars. Corporators — William L. Patterson, Robert Abrams, Wayne J. Stedelin.

Somerville, Mass.—Atlantic Motor & Supply Co., under Massachusetts laws; authorized capital, $25,000; to deal in motor cars and supplies. Corporators—A. G. Sleeper, F. A. Sleeper, H. B. Clements.

New Haven, Conn.—Motor Truck Sales Co., under Connecticut laws; authorized capital, $1,800; to deal in motor trucks. Corporators—J. F. Denison, F. J. Mansfield, W. F. Mansfield, H. W. Beach.

Logansport, Ind.—Logan Auto Supply Co., under Indiana laws; authorized capital, $25,000; to deal in motor car supplies. Corporators—Charles D. Billman, Charles D. Pettigrew, Ollie A. Cummins.

Minonk, Mo. — Minonk Central Garage Co., under Missouri laws; authorized capital, $10,000; to operate a garage. Corporators—George Kramer, D. J. Kerrigan, H. M. Harms, M. A. Petri, Frank Cronin.

Cleveland, Ohio—Ohio Auto Carriage Co., under Ohio laws; authorized capital, $10,000; to deal in motor cars. Corporators—Alfred A. Benesch, Ralph Goldsworthy, F. A. Federman, Reuben Shapiro, E. M. Chaloupka.

South Orange, N. J.—Landstra Portable Automobile Turn Table Co., under New Jersey laws; authorized capital, $150,000; to manufacture motor car devices. Corporators—Dirk S. Landstra, Edward D. Ely, Fred C. Schlather.

New York, N. Y.—S. J. Wise & Co., Inc., under New York laws; authorized capital, $20,000; to deal in motor cars. Corporators—C. E. Van Vleck, Jr., Short Hills, N. J.; E. M. Dalley, Larchmont, N. Y.; C. M. Kohn, 251 West 95th street.

New York, N. Y.—Webster-MacGowan, Inc., under New York laws; authorized capital, $50,000; to deal in motor cars. Corporators—George P. McGowan, William H. Webster, 136 West 52nd street; G. Monroe Dyer, 49 Wall street.

New York, N. Y.—Packard Lyric Renting Car Co., Inc.; under New York laws; authorized capital, $1,000; to rent motor cars. Corporators—John Collins, Mary Collins, 1491 Broadway; William P. Schmuck, 137 Milton street, Brooklyn.

Brooklyn, N. Y.—Jack Rabbitt Auto Co., Inc., under New York laws; authorized capital, $500; to deal in motor cars. Corporators—Frank Dunn, 11 Folsom Place;

Los Angeles, Cal.—Western Automobile Association, under California laws; to control automobile contests in California. Corporators—Frank A. Garbutt, Frank W. Young, E. Y. Boothe, E. E. Hewlett, W. J. Lacasse, L. T. Shettler, W. E. Bush, John S. Mitchell, R. A. Rowan, William M. Garland.

PROMINENT MEN IN TRADE WHO ASSUME NEW DUTIES

Resignations and Promotions That Serve To Place Many Workers In New Places—Few Leave the Industry.

Fred E. Erickson has been promoted to the post of superintendent of the Universal Motor Truck Co. of Detroit. He succeeds E. W. Bodson.

C. Robert Hoyme has been appointed manager of the Alco branch in Philadelphia. Previously he was identified with the International Motor branch in the same city.

Henry Goodman, former sales manager of the Grinnell Electric Car Co. of Detroit, has joined the Buffalo Electric Vehicle Co. He will be a member of its traveling staff.

Frank J. Sheen has been promoted to the post of purchasing agent for the Abbott Motor Co., Detroit. Previously he was in charge of the stock and tracing departments of that company.

George H. Bryant, advertising manager of the Franklin Automobile Co. of Syracuse, N. Y., has resigned that position. He will join the advertising staff of the Locomobile Co., in Bridgeport, Conn.

Russell F. Hoborn has been appointed manager of the McGraw Tire & Rubber Co.'s New York branch at 1706 Broadway. Previously and for many years he was identified with the Voorhees Rubber Co. of Jersey City.

J. T. Adams, sales manager of the Adams Bros. Co. of Findlay, O., maker of the Adams truck, has resigned that office. He has been succeeded by L. J. Adams, secretary of the company, who will perform the duties of both positions.

William D. Kelley, assistant superintendent of the Oakland Motor Car Co., has been promoted to the superintendency of the plant. He succeeds S. H. Humphries, who was transferred to Pontiac when the Elmore plant of the General Motors Co. was discontinued last fall.

Henry T. Myers has been appointed manager of the Studebaker Corporation's New England branch and will, of course, make his headquarters in Boston. Previously he had charge of the Studebaker branch in South Bend, Ind., but in addition he has served as a confidential representative of the big corporation and has spent several months in its foreign department.

R. E. Shadel has been appointed district sales manager of the Kline Motor Car Corporation for New York and the New England States, with the exception of Connecticut. He will make his headquarters in Rochester, N. Y. The vacancy in the management of the Kline branch in York, Pa., caused by Shadel's promotion, has been filled by the appointment of Thomas Borneson.

Fred E. Dayton, sales manager of the Columbia Motor Car Co., one of the units of the late United States Motor Co., has resigned that position to become general manager of the National Incinerator Co., the headquarters of which are in New York but which will erect shops in several other parts of the country. Dayton had been in the Columbia service since 1903, when that car was built by the Electric Vehicle Co., and followed its fortunes as manager, successively, of the Hartford, Boston and Chicago branches.

Top Makers Fall Apart and Sue.

Walter S. Smith and William A. Apple, who organized an automobile top making company in Dayton, O., have fallen apart and Smith has applied to the courts asking that the company be dissolved. Apple, it appears, furnished the money and Smith the experience, but apparently Smith believes that he did not get all that was coming to him, as in his complaint he alleges that on one contract for 5,000 Ford tops a profit of about $5,000 was made, one-half of which, he says, belongs to him. He asks the court to rule on that point and also to direct Apple to render an accounting for all funds since September 15th last.

Collecting an Old Stein Account.

One of the accounts of the Stein Tire & Rubber Co., which concern withdrew from the automobile trade in New York City several weeks ago, has been placed in the form of a judgment in the New York county clerk's office, the move being but one of a number which is being made to clean up the affairs of the tire house; this judgment is for $146.57 and is against Eva Grossman and Alice Foster, of Freeport, L. I., it being stated that they are the responsible parties in the Freeport Tire Co., although the active parties in the business are, it is stated, not the women.

Findlay Motor Becomes but a Memory.

The last has been heard of the Findlay Motor Co., of Findlay, O., which was organized by L. E. Ewing and which set out to do large things but which failed before doing any of them. It failed on September 19, 1911, but only last week was sold by the receiver to J. G. Cleary, of Milwaukee, for $50,000, the upset price named by the court. Cleary will dismantle the plant and remove the machinery to Milwaukee, where it will be used for purposes other than automobile manufacture.

In the RETAIL WORLD

A garage is being erected in Chico, Cal., for C. C. Brown.

Weed & McLaughlin have opened a new garage in Veazie, Me.

Alvah Weed and George McLaughlin plan to establish a repair business in Bangor, Me.

Ralph Catlin has purchased the garage of F. Hawley, in Montrose, Pa. Catlin will operate it.

J. L. Hannegan of Clayton, Wis., has sold his garage business to his partner, W. A. Lawson.

John Bendle of Protection, Kan., has sold a half interest in his garage business to W. T. Brewer.

M. H. Davis, of Lynn, Mass., plans to open a garage and machine shop in Westboro, in the same State.

Gunther & Knittle, of Catawissa, Pa., have had plans prepared for a new garage; the firm handles the Ford.

W. C. Morris, formerly of Weston, Mich., has opened a garage and machine shop in Onsted, in the same State.

August Holterman has been admitted to partnership in the De Pere (Wis.) Motor Car Co. by Joseph Hallett.

H. W. Dimmitt of Wymore, Neb., has sold his garage business to A. J. Hubbell of Beatrice, in the same State.

Samuel Dey of Englishtown, N. J., has purchased a site in North Cranbury, in the same State, and will erect a garage.

The B. M. Byrne Garage Co., of Grand Rapids, Mich., has changed its name to Central Automobile & Supply Co.

R. B. Wiar, formerly of Coin, Ia., has leased the Farragut Garage, in Shenandoah, in the same State and will operate it.

The Lincoln Motor Sales Co. has opened offices in Los Angeles at 1217 South Flower street; Lincoln half-ton trucks are stocked.

M. T. Kennett of Covington, Ky., is about to establish a garage and repair shop in Cincinnati, O. It will be located on Reading road.

Langford, Bacon & Myers have entered the trade in San Francisco; they will distribute Lauth-Juergens trucks on the Pacific Coast.

The H. W. Newman Machine Co., of Davenport, Ia., has let the contract for a two-story brick garage; it will be located on 3rd street.

L. W. Spencer has established an accessory store in Council Bluffs, Ia., at 301 West Broadway; the style is Spencer Auto Supply House.

E. J. Gilmer and S. J. Webster have entered the trade in Toledo, O., at 127 Erie street; they represent a line of quick tire repair material.

August A. Jonas, of Milwaukee, Wis., has had plans drawn for a garage, to be located on Prospect avenue; it will accommodate 150 cars.

A two-story garage with an 80-foot front is to be erected in Brooklyn, N. Y., on St. Mark's avenue, for the occupancy of the Rudd Taxicab Co.

George F. Gillson has let the contract for the erection of a garage in the Whistler Subdivision, in Los Angeles; the cost is estimated at $9,340.

Frank Banks, S. V. Saxby and Dr. G. N. Butchart, of Hibbing, Minn., have purchased the F. M. Smith Co.'s garage; they will continue the business.

A garage, 100 x 120 feet, is to be erected in Los Angeles at 310-16 Boyd street; when completed it will be occupied by the Los Angeles Auto & Taxicab Livery.

Mahlon S. Drake of Newark, N. J., has secured plans for a garage, 59 x 100 feet, which he will have erected on William street; the estimated cost is $15,000.

B. F. Dixon and Judson Thomas of Washington, Ia., have dissolved partnership; Dixon will continue the automobile business which the copartnership conducted.

M. T. Kennett, owner of the Kentucky Motor Sales Co., has let the contract for the construction of a garage, in Cincinnati, O., on Reading road; it will be 100 x 75 feet.

City Garage is the style of a business which is about to be established in Long Beach, Cal., at 212 Locust street; a building which is now being erected will cost $17,000.

H. L. Kimmel and G. Brodt have opened a repair and machine shop in Los Angeles at 1230 South Figueroa street; they formerly were connected with the American agency.

R. H. McKenzie of Walla Walla, Wash., has purchased the Waitsburg (Wash.) Garage of S. H. Champ & Son; H. M. Champ, the son, has taken a position with the Holt Mfg. Co.

M. H. Lawler and F. L. Poor are about to enter the trade in Brockton, Ill., under the style Lawler & Poor; they will handle Ford and Studebaker cars and conduct a repair business.

The Shawnee Motor Car Co., of Topeka, Kan., has been taken over by the West Motor Car Co. The latter will continue the business at the former location, 928 Kansas avenue.

Borstner & Scott, operators of the Holly (Col.) Garage, have sold out to Heckethorn & Brown, of Lamar, in the same State; the new style will be Heckethorn & Brown Automobile Co.

The Franklin Automobile Co.'s branch in Cleveland, O., has been discontinued; hereafter the company's business in that territory will be handled by the C. H. Eckenroth Sales Co.

Automobile Tire & Tube Hospital is the style of a business which has been established in Cincinnati, O., at 907 Race street; W. M. Galt is "head physician" and H. V. Hague "chief interne."

Thomas W. Bunnell, Cutting dealer in Toledo, O., and Charles A. Newman, Cole and Little dealer, have consolidated under the style Bunnell Auto Sales Co. Salesrooms have been secured at 1416 Madison avenue.

Monnich & Monnich, dealers in Sioux City, Ia., have dissolved partnership; John Monnich will open a similar business in Fremont, in the same State, and Bernard Monnich will operate the Hooper Garage, in Sioux City.

Edward S. Clark, who has been associated with his father, Edred Clark, in the Paige-Detroit agency in Hartford, Conn., has taken over his father's share of the business; he will conduct it hereafter at 183 Allyn street.

The garage firm of Kerrigan & Dickman, of Minok, Ill., has been dissolved, Dickman retiring; replacing it there has been formed a corporation consisting of D. J. Kerrigan, H. M. Harms, Michael Petri, Frank Cronin and George Kramer.

Paterson, N. J., is about to have a new

Digitized by Google

garageman; Frank A. Pawleski, a licensing agent of the Motor Vehicle Department of that State, is arranging to open up at Paterson and Governor streets.

The Western Auto Supply Co., located in Omaha, Neb., at 20th and Farnam streets, has been sold by George and Harold Pritchett to Edward Pegau and Herbert Kohn; the new owners formerly were employes of the Pritchett brothers.

John R. Oakes, formerly of Lexington, Ky., has entered the trade in Galesburg, Ill., at 240 East Simmons street, under the style Cadillac Automobile Co. of Galesburg. The business is subsidiary to the Cadillac Automobile Co. of Peoria.

The Keeton Motor Co. of New England has been formed in Boston to distribute the car of that name in New England territory; the organizer of the business is W. B. Doan, who was manager of the Oldsmobile branch in Detroit from 1908 to 1911.

The Des Moines (Ia.) Auto Supply Co., recently organized, has taken quarters at 1007 Locust street; A. G. Bigelow is president and B. O. M. Bonebrake secretary and treasurer. The company will take advantage of the Parcel Post and make a specialty of mail order business.

David S. Hendrick, a dealer in Washington, D. C., has incorporated under the style David S. Hendrick Co., Inc.; Hendrick is president and general manager, S. G. Kirtland, secretary and treasurer, and A. L. Middlekauff, assistant to Kirtland. Franklin cars are handled.

The Gauntlett Auto Sales Co. has been incorporated with a capital of $50,000 and is about to enter the trade in Southern Michigan and Northwestern Ohio; Buick cars and G M C trucks will be handled, with Toledo as headquarters and a branch in Milan, Mich. E. D. Gauntlett of Milan, who operates department stores in that town and Manchester, Mich., and who has banking and manufacturing interests, is the head of the new company.

Cox Also Defeats Neverout Patent.

In line with the decision of Judge Cross in the Federal court in New Jersey, in which the same patent but different defendants were involved, Judge Hazel, in the United States District Court in Buffalo, N. Y., last week dismissed the suit of the Rose Mfg. Co. of Philadelphia, Pa., against the Cox Brass Mfg. Co. of Albany, N. Y., for alleged infringement of the so-called Neverout lamp bracket patent, No. 883,973. Although employing less vigorous language than did Judge Cross, and stating that he had arrived at his conclusion before Judge Cross's decision had been called to his notice, Judge Hazel declared that "although the patentee seems to have been the first to employ a combination of lamp bracket and number plate as an automobile accessory, still it is doubtful whether such combination required the exercise of inventive faculty, in view of the use to which lamps and lamp brackets" previously have been put in illuminating other articles.

Franklin Companies Re-elect Franklin.

Almost as a matter of course, H. H. Franklin was re-elected president of both the H. H. Franklin Mfg. Co. and the Franklin Automobile Co. at their annual meetings, which occurred in Syracuse last week. The other officers chosen are as follows: For the H. H. Franklin Mfg. Co—John Wilkinson, vice-president; Frank A. Barton, secretary and treasurer. These officers and Giles H. Stilwell, Edward H. Dann, A. T. Brown and W. C. Lipe constitute the board of directors. For the Franklin Automobile Co. — Giles H. Stilwell, vice-president; Frank A. Barton, secretary and treasurer. In addition to these officers, John Wilkinson and Edward H. Dann were elected directors. The only change effected by the election was an interchange of vice-presidencies by Wilkinson and Stilwell; Wilkinson, who formerly was vice-president of the automobile company, was made vice-president of the manufacturing company, since he recently has assumed the position of manager of the plant. Stilwell's change was vice versa.

Grabowsky Assets Sold by Receiver.

At the receiver's sale of the Grabowsky Power Wagon Co. in Detroit on the 22nd inst., the factory building was sold to the E. G. Budd Mfg. Co., the Philadelphia steel body builders, who paid $110,000 for the property. The machinery also was disposed of in parcels to various patrons, the Grabowsky patterns, jigs, dies, tools and part of the machinery being purchased by the Seitz Automobile & Transmission Co. of Wyandotte, Mich. The Seitz company, it is said, will continue the manufacture of the Grabowsky trucks at Wyandotte, and for the time being, at least, under the direction of George A. Horner, who managed the Grabowsky plant after it was taken over by the creditors' committee which unsuccessfully endeavored to avert bankruptcy.

Krit and Baron Settle Differences.

The suit brought by the Krit Motor Car Co. against Ferdinand Van der Noot de Moorsel, a Belgian nobleman, and Philip Breitmeyer, of Detroit, was settled out of court last week. The terms of settlement were not made public. The Krit company sued to recover $1,000 on a bond signed by Breitmeyer when the Belgian was appointed to represent the Krit company abroad. It alleges it delivered to de Moorsel two cars for exhibition purposes and that he converted them to his personal use and otherwise did not live up to his bond. The foreign nobleman maintains that he sold 48 cars but that the company ignored his order, while Breitmeyer claims that the contract was amended after he gave bond and that the amendment released him from further obligation. When the Krit action first was filed, the baron retorted with a suit for $10,000.

I. H. C. Wagon Goes to New Company.

The $140,000,000 International Harvester Co. which, among other things, makes the I. H. C. motor wagon, is about to transfer all of its foreign business and certain of its American plants to the International Harvester Corporation, which has been organized for the purpose under the laws of New Jersey with an authorized capital of $70,000,000. The capital is made up of $30,000,000 7 per cent. preferred stock and $40,000,000 common.

The stockholders in the old company will be permitted to exchange half their holdings for an equal amount of stock in the new company. The plants which have been transferred to the latter are those in Akron, Milwaukee, Newark Valley, N. Y., and two other plants in Chicago, the transfer carrying with it the big corporation's automobile interests.

Recent Losses by Fire.

Blunt, S. D.—Blunt Auto Co., garage destroyed. Loss not given.

Charter Oak, Ia.—E. T. Malone, garage destroyed. Loss not given.

Appleton, Wis.—Calumet Auto Co., garage and cars damaged. Loss, $2,500.

Sioux City, Ia.—H. A. Wetmore, 517 6th street, garage destroyed. Loss not given.

Davenport, Ia.—Raymond E. Hosler, 518 East High street, garage destroyed. Loss not given.

Garagemen Neglected Their Oil Bill.

Suit has been brought in the Supreme Court for New York county by the Standard Oil Co. of New York against George C. Hyde and R. Burchard Hultz, who operate a garage at Port Washington, L. I., under the style Hyde & Hultz; the claim is that between May 9 and November 14, 1912, the two men bought oil to the value of $515.35 and failed to pay for it.

Seattle Branch for Kelly Trucks.

The Kelly-Springfield Motor Truck Co. has opened a branch in Seattle, Wash., at 511-13 East Pike street. It is in charge of Henry Schmidt, who has been identified with the Packard agency in Seattle for several years.

Cable Address, "MOTORWORLD," NEW YORK

Entered as second-class matter at the New York Post Office, November, 1900

NEW YORK, JANUARY 30, 1913

GASOLENE'S COST AND ITS EFFECTS.

In artfully seeking to defend the 90 per cent. increase in the price of gasolene which has been brought about in the United States in about a twelvemonth, those who point out that abroad 30 cents or 40 cents per gallon is the prevailing rate, overlook that the effect is exactly what may be expected to arise from such a cause: i. e., that while the automobile industry of the United States has grown by leaps and bounds to enormous proportions the high price of gasolene on the other side of the "pond" is one of the reasons why the foreign industry has remained practically at a standstill.

The number of cars and trucks in use in New York State alone about equals the number of such vehicles in use in all of Great Britain, and the number in use in Pennsylvania or Ohio, for instance, or any other two fairly populous States, about equals, if it does not exceed, the total number of four-wheeled motor vehicles in use on the Continent.

It is a pretty contention that Americans will purchase automobiles in undiminished numbers whatever may be the price of fuel, but the contention is prettier than it is sound. It is reasonably certain that they will do no such thing, or if so, they will incline to the purchase of small cars rather than large ones, or even the moderately large ones, which now are numerously available at fairly popular prices. This is a thought which American car manufacturers well may keep in mind.

When the fuel cost alone of operating a truck figures out at five or six or seven cents a mile, or more, it is certain that possible truck purchasers will stop long to count the cost, and it is equally fair to assume that a very considerable number of intending car buyers will do likewise, even though the fuel cost per mile may average but one-half of those sums.

As Motor World several times has remarked, the one fact which stands out above all others is that regardless of whether the supply of gasolene exceeds the demand or the demand exceeds the supply, and regardless of any other conditions which may obtain, the profits of the Standard Oil Company remain undiminished. On a capitalization which is so prodigious as to be almost unhealthy, the profits of the grasping corporation are of the same unhealthy proportions. Usually anything that legitimately affects either supply or demand, or both, is reflected in the earnings of the interests represented. Apparently, however, nothing affects Standard Oil. It applies thumbscrews whenever desire for more money possesses it.

"INTERLOCKING" GARAGEMEN AND OWNERS.

The unfortunate plight, due to the practices of its chief promoter, in which the most recent of the many so-called "national associations" which seek to interlock the interests of the garage keeper and the car owner, finds itself, serves to call renewed attention to the persistency with which that will-o'-the-wisp has been pursued in so many directions.

Many shrewd or over-shrewd men, seeking only their personal profit, have found the use of such terms as "association," "league" or "society," an attractive means of adding to their incomes, but somehow their efforts to dovetail the interests of the garage keeper and the car owner have met with a lack of success which is not short of remarkable.

In theory, such projects contain all the elements of "easy money"; nothing appears simpler or more enticing than a proposal to bring patrons to a garage by holding out to the patrons promises of special rates or special services of some sort. On the surface, such an arrangement seems so advantageous to both of the interests involved that the bringing together does not suggest great difficulties, but that the difficulties are very much greater than theory leads to believe is evidenced by the long succession of failures which have overtaken such highly colored enterprises.

Always it has seemed that the sponsors of such undertakings, masked as a "national association," would encounter no great trouble in finding a sufficient number of garagemen and car owners willing to part with good money for apparent benefits, usually pictured by skillful use of language which, however, promises little or nothing that is definite. It is to the credit of both the garage keeper and the car owner that they refuse to succumb to such blandishments. Generally speaking, the comparatively few who have done so have obtained for their money little more than a gilt-edged certificate, which constitutes an interesting souvenir of theory gone wrong, if it stands for nothing more—or less.

ENGLAND'S IMPORTS EXCEED EXPORTS BY $14,000,000

Both Increased During the Year 1912 But Previous Conditions Remain Unchanged—Import of Parts Attains Great Strength.

During the year 1912, Great Britain's exports of cars and parts totalled £3,681,824, as against £3,186,238 during the previous twelvemonth. Of the total, £1,220,294 is represented by parts and the remainder by the value of 5,282 complete cars and 1,179 chassis; in 1911, there were exported 4,536 cars and 735 chassis. During the year the average value of cars exported fell from £397 to £383.

The imports into Great Britain during 1912 far exceeded the exports, totalling £6,381,448, as compared with £5,312,773 during the previous year. Of the total, £3,185,227, or almost exactly 50 per cent., is represented by parts. The total number of cars imported was 6,276 and the number of chassis 6,890, the average value of the complete cars being £326, as against £247 during the previous year. The chassis averaged £278, as compared with £253 during 1911.

Kalamazoo Fullers Adopt Family Name.

Fuller & Sons Mfg. Co. has succeeded the Michigan Automobile Co., Ltd., of Kalamazoo, Mich., the change being one of name only. Frank D. Fuller is president and general manager of the company, which is capitalized at $100,000, his elder son, L. C., being secretary and treasurer and the younger one, W. P., manager of sales. W. E. Upjohn is vice-president. The change of name is due to the fact that the manufacture of automobiles was discontinued several years ago, and also because the Michigan Motor Car Co., makers of the Mighty Michigan, have since attained prominence in the field. Fuller & Sons will continue to devote themselves to the manufacture of parts, chiefly transmission elements.

Nichols Takes on Velvet Absorbers.

J. C. Nichols, Inc., of 1671 Broadway, New York, has acquired the Eastern sales agency for the Velvet shock absorber made by the John W. Blackledge Mfg. Co. of Chicago. Nichols will handle the shock absorber in connection with the Schebler carburetter and his other accounts.

Johnson Brothers to Produce Engines.

The three Johnson brothers of Terre Haute, Ind., who have been building motor boat engines on a small scale, have found the necessary capital and organized the Johnson Bros. Motor Co., which has been incorporated with an authorized capital of $70,000. The Commercial Club of Terre Haute has found adequate shops for the new company, which immediately will enlarge its scope to include the production of automobile engines. Among those interested in the enterprise are Demas Deming, a Terre Haute banker, and Charles Minshall, a Terre Haute and Chicago capitalist.

Buffalo Kissel and Oil Company at Odds.

Were the Buffalo (N. Y.) Kissel Kar Co. not entitled to a credit of 90 cents on the books of the Indian Refining Co., of New York City, the amount for which the latter is suing the former in the Supreme Court for New York county would be $124.55; as it is the 90 cents is deducted in the demand for a settlement. The Indian company claims the amount is due for its products supplied to the Buffalo concern between August 16 and November 8, 1912.

Endorsement Brings Woe to Wyckoff.

Because Clarence F. Wyckoff endorsed three three-months notes given by the late Wyckoff, Church & Partridge, of New York City, early in 1912 and late in 1911, he has been made the debtor in a judgment for $1,160.09 filed last week in the New York county clerk's office by the Diamond Rubber Co. of New York; the dates and faces of the notes were: December 11, 1911, $312.41; January 10, 1912, $379.80; February 10, 1912, $381.64.

Dissatisfied Purchaser Attaches Packer.

Because a Packers truck was not according to the specifications named in the contract of sale, as the Colonial Mantel & Refrigerator Co., of New York City, claims, the latter this week brought suit in the Supreme Court for New York county against the Packers Motor Truck Co., of Wheeling, W. Va. The amount asked is $3,043, and as a preliminary move the complainant asked and was granted an attachment against the defendant's property.

Rayfield in Metropolitan Branch.

The Findeisen & Kropf Mfg. Co., maker of the Rayfield carburetter, has established a sales and service branch in New York at 1902 Broadway, which premises previously were occupied by the Warner Instrument Co. Experts direct from the Rayfield factory will render the service.

Dealer and Supply Firm in Court.

Judgment for $31.87 was entered last week in the New York county clerk's office against Cryder & Co., automobile dealers, of 583 Park avenue, New York City, by the General Automobile Supply Co., of 1671 Broadway; the amount represents an unpaid bill for supplies.

February 1-8, Chicago, Ill.—National Association of Automobile Manufacturers' 12th annual show in the Coliseum and 1st Regiment Armory. Pleasure cars only.

February 3-8, Washington, D. C.—Washington Automobile Show Co.'s exhibit in Convention Hall.

February 8-15, St. John, N. B.—First annual show of the New Brunswick Automobile Association in the Drill Hall.

February 8-15, Youngstown, Ohio—Annual show of the Youngstown Automobile Show Co. in the Auditorium and Annex.

February 8-15, Hartford, Conn.—Sixth annual show of the Hartford Automobile Dealers' Association in the State Armory.

February 10-15, Minneapolis, Minn.—Minneapoils Automobile Show Co.'s show in the National Guard Armory.

February 10-15, Chicago, Ill.—National Association of Automobile Manufacturers' 12th annual show in the Coliseum and 1st Regiment Armory. Commercial vehicles only.

February 12-15, Geneva, N. Y.—Annual show in the State Armory, under the auspices of the Ottawa Valley Motor Car Association.

February 15-22. Albany, N. Y.—Annual show of the Albany Automobile Dealers' Association in the State Armory.

February 15-22, Newark, N. J.—New Jersey Exhibition Co.'s Sixth annual exhibit in the First Regiment Armory.

February 16-23, Richmond, Va.—Richmond Automobile Dealers' Shows Co.'s exhibit in the Horse Show building.

February 17-27, Kansas City, Mo.—Kansas City Automobile Dealers' Association's show in Convention Hall. First week pleasure cars; second week commercial vehicles.

February 19-22, Davenport, Ia.—Annual show of the Tri-City Automobile Dealers' Association in the Coliseum.

February 19-22, Oshkosh, Wis.—Oshkosh Automobile Dealers' Association's second annual show in Armory B.

February 20-22, Canandaigua, N. Y.—Motor Car show in Hawley's Garage, under the management of A. Blumenstein.

March 8-15, Boston, Mass.—Boston Automobile Dealers' Association's annual show in Mechanics' Hall. Pleasure cars only.

March 19-25, Boston, Mass.—Boston Commercial Vehicle Association's annual show in Mechanics' Hall.

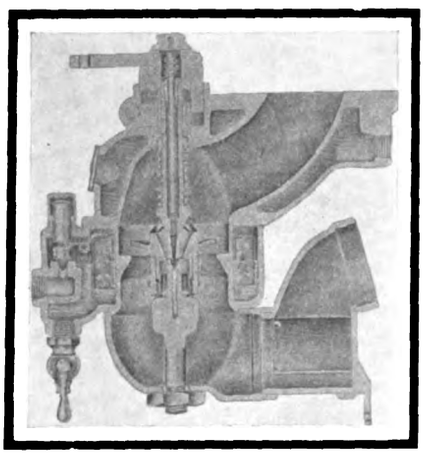
MUCH THAT IS NEW REVEALED IN DETROIT'S OWN SHOW

Two Cars and Two Carburetters, One With Throttle in Unusual Place—Annex Required to House Exhibits.

The Hub of the Automobile Universe—that is to say, Detroit—was set whirling on its anti-friction bearings on Monday evening, the 27th, when the 12th show of the D. A. D. A., otherwise the Detroit Automobile Dealers' Association, was opened with every exhibit in place and every bit of work completed on the really splendid decorations.

Wayne Garden, the exact center of the hub for the time being, was entirely too cramped for the 72 exhibitors—44 of cars and 28 of accessories—and it became necessary to build an annex to provide the additional space required. The energy required to spin the Hub on its bearings was directed by President Neumann and Manager Wilmot of the D. A. D. A., and though their "overtime" will not come to an end until the show closes on Saturday night, the way in which they and their associates put their shoulders to the wheel has called for comments of the blush-producing kind. It may be that it is not necessary to add that the show is by all odds the best that the Automobile Hub yet has swung; the statement is made, anyway, and there's no such thing as contradicting it.



Decorations of "Worth While" Type.

As for the decorations, on which the D. A. D. A. has spent $6,000 coin of the realm, it would be proper to say that they are simple and effective—they are—if these terms were not so worn that they seem to have lost their real significance. Under the circumstances it is necessary to go further, and say that they are a good deal more than good. They have been made to suit the place. While cold statements give little of warm realities, it will help the imagination to set forth that the ceiling is tinted to give the effect of sky, in which countless purple lights simulate twinkling stars; apart from these, the lights are concealed and the illumination is softly diffused. Landscapes decorate the walls, helping out the sky effect. There are no divisions between the exhibits, so that there is no obstruction to the eye, and the whole sweep can be taken in at a glance. The decorative scheme, which is the work of J. L. Hall, is fittingly characterized as "something worth while."

As a matter of course, many of the special exhibits are those which were shown in New York. The Cadillac electrically operated chassis, the Hudson cutaway chassis, the Briggs-Detroiter ivory-and-gold touring car, the complete Studebaker line, the exhibits of the Chevrolet, Cartercar, Lozier and most of the others are simply transplanted. But, on the other hand, there are not a few exhibits that New York did not see. The Ford, the Century, Detroit, and Grinnell electrics, the Traveler, the Warren and the Star did not appear in New York.

Star and Traveler Make Debut.

Of these the Star is a brand new machine, built by the Star Motor Car Co., of Ann Arbor, Mich., which was incorporated under Maine laws last fall with a capitalization of $500,000 and took over the assets of the Huron River Mfg. Co., and of which Gottleib Luick is president. The product is a line of commercial vehicles—light trucks and delivery wagons—of 1,500 pounds and 1 ton capacity, built throughout of standard parts, with four-cylinder motors, shaft drive to gearset, built as a unit with the jackshaft, and final drive by side chains. The Traveler also is a new machine, and stands in the limelight because of the fact that it is to be sold direct to the public by its manufacturers, the Traveler Motor Car Co., of Detroit, of which J. P. Lavigne is president.

CARBO-METER IN SECTION

The Traveler is a touring car of a popular type, having a 36-horsepower motor, unit power plant style, driving through disk clutch, selective sliding gears and bevels to the full-floating rear axle. The wheelbase is 120 inches; the tires are 34 x 4 inches. As befits a modern machine, the regular equipment is complete, including a Gray & Davis electric lighting system, among other things.

The Detroit electric "clear vision" brougham, upholstered in yellow, is a real attraction for the fair sex—and in this day of widely disseminated knowledge who shall say that the upholstery is the cause of its popularity? The Warren people, for the first time, exhibit a seven-passenger "six" and a "six" chassis, as well as their older four-cylinder touring car.

The accessory exhibits, though more than a third of the total number, occupy a small amount of space; nevertheless, there are several decidedly interesting new things shown that did not adorn the New York show lists. Chief of these is the Carbo-Meter, which is a carburetter of novel construction representing three years' study and work by William Shakespeare, Jr., the Kalamazoo (Mich.) manufacturer of "Honor Built" fishing tackle and other sporting goods.

Shakespeare's Radical Carburetter.

As the accompanying illustration shows, the most striking feature of the instrument is the fact that the throttle is placed on the intake side of the mixing chamber, which is just the opposite to the usual position between the mixing chamber and the outlet to the manifold. Moreover, the form of the throttle and its functions are radically different from the more familiar butterfly devices commonly employed. In fact, the throttle is the whole carburetter, to use a common expression. The float is in a comparatively small annular chamber around the middle of the body, and the spray nozzle is in the center of the space surrounded by the float chamber. A small annular air passage is formed around the spray nozzle. The throttle consists of a disk large enough to close the main air passage completely when seated; its movement is up and down. There is a central hollow boss in the lower part of the disk which slides over the ports which admit air from the main air passage to the small auxiliary passage. The central air opening contracts sharply, causing the small air current to converge upon the gasolene outlet, and above the nozzle the opening expands, funnel-like, open into the main air passage, or the mixing chamber, as it is at this point. There is a central stem from the throttle rising through the top of the carburetter where it carries the operating lever, and in the center of the stem, projecting downward into the spray nozzle, is a needle valve, with a very long and extremely fine taper.

Obviously the needle moves with the throttle. Therefore, when the throttle is raised the main air passage is opened, as also is the small central air duct, and at the same time the needle-valve rises in the nozzle and permits a larger quantity of spray to be drawn out; incidentally, the spray is forced to assume a funnel shape, mixes with the small air current and this, in turn, meets and mixes with the main air supply in the mixing chamber. The arrangement is clearly shown in the accompanying illustration,

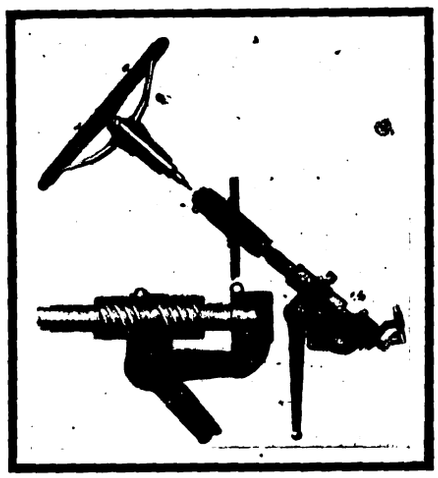
Digitized by Google

though it is somewhat difficult to describe clearly.

Other features of the Shakespeare instrument include a hot air intake provided with a dash-operated regulating device which allows close regulation of the temperature of the air current as a whole. It will be observed that there is but one moving part, the throttle, and no springs, no auxiliary air inlets and no adjustments beyond those for the needle valve, which is permanent, once set, and the temperature regulator, which affects temperature only.

The fact that it makes easy the elimination of back-lash from the primary operating device lends no small interest to the Boyer steering gear, made by the Boyer-Miller Co., Detroit, which is shown very clearly in the accompanying illustration. The central feature of the gear, and the only one that is not immediately apparent, is that the two parts of the nut can be rotated with relation to each other when the central sleeve, which normally clamps them together as one, is loosened by turning a pinching screw. Thus one section can be moved away from the other a distance equal to the amount of wear on the threads, and in this way all wear can be taken up and the gear will work without lost motion in the screw until the threads are absolutely worn out.

Novel Self-adjusting Carburetter.



Another novelty in gas-supplying devices is the Krause self-adjusting carburetter, made by the Krause Mfg. Co., of Detroit. The interesting feature is the manner in which the air passage is controlled automatically. There is a set of three flat metal rings with central openings of varying diameters, the largest at the bottom and the smallest at the top, and a central ring which has a sleeve that goes around the spray nozzle, leaving only a small annual passage. The rings are lifted by the vacuum when the engine is turning over, and the stronger the vacuum the more rings are lifted and floated, and the larger the quantity of air admitted. There are no springs, and the only adjustments are made by means of the main air valve at the bottom and the ordinary float valve.

The Automobile Equipment Co., of Detroit, shows a neat little device for heating the gasolene in the bowl of the carburetter, and so facilitating starting. The device takes the form of a plug which is screwed into the carburetter in place of the drain cock; there are two terminals for the connecting wires—from a 6-volt battery—and there is practically nothing to get out of order. Before starting the motor the current is switched on, heating the gasolene in the bowl and causing it to vaporize rapidly.

The booming industry of stealing automobiles has resulted in the bringing out of many kinds of thief-proof devices, the latest being that of E. H. Bryant, of Cleveland. It consists of a lever-locking arrangement in the form of a pair of wedges which, when the gear-shifting lever is in neutral position, slide down and fill the space in the slot, so the lever cannot be moved from neutral until the Yale lock is unlocked. The Bryant lock fits any of the standard gear-shifting levers and weighs one pound.

Claim Advantages for Plate Radiator.

Another new creation is shown by the Farlinger Mfg. Co., of Detroit—the Fa-vose plate radiator, which is of plate construc-

BOYER STEERING GEAR

tion, and is said to be much lighter, as well as exposing greater surface to the air than other radiators. Even in the large sizes it is said there are not more than 30 pieces of metal, all told. The car exhibitors follow:

Abbott Motor Co., Abbott-Detroit; Annett Auto Garage, Auburn; Artemas Ward, King; Baker Electric Co., Baker Electric; Barber Motor Sales Co., Detroiter; Bemb-Robinson Co., Hudson; Buick Motor Co., Buick; Cadillac Motor Car Co., Cadillac; Cartercar Co., Cartercar; Century Electric Sales Co., Century Electric; Chevrolet-Little Co., Chevrolet and Little; Church-Field Co., Church-Field Electric; Cleveland-Galion Motor Truck Co., Cleveland-Galion trucks; Cunningham Auto Co., Flanders, Maxwell; Detroit Electric Garage, Detroit Electric; Detroit Hupmobile Sales Co., Hupmobile; Ford Motor Co., Ford; Foster Motor Sales Co., Cutting; General Motors Truck Co., G. M. C. trucks; Grant Bros. Auto Co., Lozier; Grinnell Electric Car Co., Grinnell Electric; Havers Motor Car Co., Havers; J. P. Schneider, Locomobile, Stevens-Duryea; Keeton Motor Co., Keeton; Krit Motor Car Co., Krit; M. A. Young, Mitchell and Reo; Neumann-Lane Co., Chalmers, Pierce-Arrow and Rauch & Lang Electric; Oakland Motor Car Co., Oakland; Overland Motor Sales Co., Overland; Postal-Fair Motor Co., Michigan, Peerless; P. H. and Hupp-Yeats Electric; Regal Motor Sales Co., Regal; Seidler Sales Co., Jackson; Siegel-Zeckendorf Co., Cole; Standard Auto Co., Packard; Studebaker Corp., Studebaker; Thompson Auto Co., Alco, Federal and Standard trucks; Traveler Motor Car Co., Traveler-Detroit; Warren Motor Car Co., Warren; Winton Motor Car Co., Winton; W. J. Marshall Auto Co., Paige; Star Motor Car Co., Star.

Seeks to Prevent Testing on Highway.

If the bill introduced into the State legislature by Representative S. J. Miller, of Marion county, Indiana, is enacted as a law, it will become illegal for a manufacturer, or any other person, to use a public highway for the purpose of testing out his vehicle. The bill, which is aimed at the Indianapolis manufacturers, provides a fine of not less than $50 nor more than $200 for each offense. The word "testing" is defined as meaning "the driving of an automobile or motorcycle before it has been fully assembled and equipped with its final accessories, for the purpose of ascertaining necessary adjustments of machinery defects in material or workmanship."

Ohioans Evolve a Rust-Proof Paint.

Rust on tire rims, bolts and rings is troublesome in more ways than one; it is destructive to both the rubber and the fabric of tires, and if allowed to form to any great extent it causes things to stick in a most troublesome way. To eliminate such difficulty, a rust-proofing paint, one application of which will prevent corrosion for a season, has been evolved by the Anti-Rust Paint Co., of Akron, O., and now is being offered to the trade; its efficiency lies in its ability to stick to the metal surfaces and to resist the inroads of moisture. A little unexpected trouble with a rusted "quick" detachable rim is sufficient to indicate the value of an efficient paint of this character.

Get Two Car Thieves in Los Angeles.

The mystery of the disappearance in Los Angeles of 31 cars, valued at $45,000, within the last few months has been cleared by the arrest in a junk shop of two young men—George Nelson, 17, and Edward Frame, 18, both former garage employes. They said it was their plan to watch until a car was left at the curb, when one of them would jump to the wheel while the other cranked up; then both dashed away to a deserted section and stripped off tires and other easily saleable parts. They received 8 cents a pound for shoes and 15 cents for tubes. The police believe the arrests will lead to the apprehension of a ring of automobile thieves.

REILLY BENEFITTED BY RIVAL'S EXAGGERATION

Salesman of Competing Line Loses Sale by Over-Painting the Merits of His Car—Reilly Obtains the Order and Shows Sales Manager Wherein There Is Strength in Apparent Weakness.

"There goes a chap who did me a good turn the other day," remarked Reilly, who stood at the front of the showroom, his foot upon the squatty steam radiator, as he pointed to a passing car of a rival make with a fur-coated driver at the wheel.

"Who is he?" asked the Sales Manager, bringing back to earth his gaze, which had been directed upward at the fascinating

"THERE GOES A CHAP WHO DID ME A GOOD TURN," REMARKED REILLY

spectacle of a multitude of fluffy snowflakes which were floating slowly and gracefully to the street.

"That's Brust, the Prince dealer; what did he do for me? Oh, he sold a car for me," casually rejoined Reilly, in answer to the Sales Manager's question.

How Another Dealer Helped Reilly.

"Sold a car for you? Since when did he become a philanthropist?"

"Since he started in as a dealer," replied Reilly with a quizzical smile. "That was about—let's see—six or eight months ago. As to his being a philanthropist, he may be, but he doesn't know it. I would be the real philanthropist if I explained to him why he is one."

"When you get through talking in circles perhaps you'll say something that means something," testily retorted the Sales Manager.

"Just to accommodate you I'll present the story in Kindergarten form," came back the dealer. "Brust helped me sell a car by making a bum job when he had a chance to make a sale, and the customer came to me; I sold him a car but by not doing what Brust did."

"You can't keep from going around in your conversation, can you? You're just like a dog that's getting ready to lie down," said the Sales Manager disgustedly.

"Well, if you'll subside for a minute, I'll sift it into your skull. Brust has a good car, but he didn't know how to make the prospect believe it; instead of winning over the would-be buyer, Brust antagonized him by telling him things the man was sure couldn't be true. And once the prospect felt that Brust was exaggerating on one point he naturally believed there was exaggeration on all points, so he didn't buy."

"What, for instance?" asked the Sales Manager.

"Well, for one thing, Brust told him the car used less gasolene than any other car on the market. The car isn't extravagant in its consumption of fuel, neither is it a world-beater for economy; but to say it absolutely used less gas than any other car, would go further on a gallon than any other car made, and thereby would make a substantial reduction in the owner's operating expense is some statement. The Prince car is a good car all right and gives reasonable service, but Brust couldn't back up his statements.

Exaggerator Who Didn't Make Good.

"The prospect, whose name is Robertson, was a bit skeptical, but thought that if there were any truth in the statement it was worth investigating, at least. He asked Brust why it was so economical. Brust said that, for one thing, the motor was smaller and yet was large enough for all practical purposes. That much is true, to a certain extent, but Robertson, who, like most owners, knows a thing or two about cars, named several other makes and asked Brust if the motors were not about the same size. Brust didn't really know, but when Robertson began to tell the different bores and strokes, Brust had to give up the size argument.

"Then he grabbed at the carburetter as the next thing, but while he showed some difference he couldn't demonstrate anything at all remarkable. Then he began to talk about the radiator, and Robertson wanted to know what the radiator had to do with it. Brust brought up other points, but a well-informed man like Robertson realized at once that the claim of economy was based chiefly on 'bunk,' at least so far as Brust could tell."

"But how did that help you?" interrupted the Sales Manager.

Prejudice Aroused Against the Car.

"Wait, wait! I'll get to that in a minute," admonished Reilly. "As I was about to tell you, Robertson and Brust went over other points of the car, but when Brust did hit what really was an excellent selling point Robertson's mind was in anything but a receptive condition. Robertson had become prejudiced because he thought Brust was trying to tell him a lot of stuff that wasn't true; and so he was. Brust didn't set out to lie about the car, but he repeated a lot of those old and exaggerated statements that have been used in various forms ever since Jacob and Esau drove that disastrous bar-

Digitized by Google

gain in the birthright-mess-of-oatmeal deal.

"Robertson didn't buy. But he wanted a car, and I got in touch with him; how I reached him is another story, but when I started to tell him about our car he became interested. He wanted to know if it was not the most economical car on the market in the way of fuel. I told him as I tell everyone, when that question comes up, that it was not. He asked questions, and I told him some things that I wouldn't have told had he not asked. The substance of my story was that, while there were cars which would use less gasolene, they were invariably cars of less power and that for this size of car our car was not surpassed, and that, while it was not so exceptional in use of gasolene, it had features which are not found in other cars."

"Do you always admit a weakness, or lack of superiority?" questioned the Sales Manager.

Admission of Weakness May Convince.

"That often is an assertion of strength, more convincing than any other statement a salesman can make," replied Reilly. "Of course, it depends on whom you are talking to. I saw at once that Robertson knows all about cars, and I decided to tell him things he could see for himself were reasonably true. This so-called admission of weakness won his confidence and he believed I was telling the truth, which gave me an opportunity to lay effective emphasis upon our real selling points. Our price is neither the highest nor the lowest, and the car is neither the worst nor the best, but I succeeded in convincing him that it would give satisfaction and was about the best car he could get for the price."

"Don't you ever exaggerate?" asked the listener, in a tone which indicated that salesmen who do not do so are scarce.

Automobile Buyers Are Well Informed.

"Not very much and not very often," asserted Reilly. "Exaggeration is not the way to make sales, at least not with the intelligent class of people who are buying automobiles. A man who is out to buy a car generally knows something about cars in general before he starts. He knows his friends get 10 or 12 miles a gallon out of their gasolene and that sometimes they get a little more, so when you tell him your car will average 18 or 20 miles you've got to have some real reason to back it up or he won't believe it; generally he won't believe it anyway. Your car looks like the average car, the motor is much the same, with a radiator, carburetter and all the other parts, and why it should use so much less gas than any other car is a bit mystifying to the man who knows automobiles.

"The same exaggerated statements are made in connection with cars in many ways. How often do you hear the statement, 'Best in the world,' 'Absolutely the easiest riding,' 'Most economical in tires,' 'Uses least oil,' and a long list just like that. Such stuff has become so common that putting it in written or spoken sales talk is only wasted time. If there were but one man who claimed his car to be the 'best in the world' it might mean something, but when they all claim it no one pays any attention to it. The average man passes up this kind of talk and wants facts.

Claims Proper if They Are Supported.

"Claims of superiority are proper if there are any grounds for them. Supposing car has proved that it is easy on tires or rides easy; if there is any reason for it there is some likelihood that a man will believe it. Also, if a salesman can give what appears to be a bona fide, intelligent argument as to why his motor is economical in gasolene consumption he stands a good chance of being believed."

"'Intelligent' is good," added the Sales Manager; "one of the finest specimens of intelligence I have run across in some time was displayed by a truck salesman a few days ago. I was asking him about his truck, and he said one of its selling features was its 'assessability.' 'Assessability?' I asked, 'what's that? Do you mean that it is such a good and valuable piece of work that the city can assess it for a high price and thereby prove its value?'

"'No, no,' he replied; 'how long have you been in the business? I mean assessable—easy to get at.' I said, 'You mean accessible, don't you?' 'No, I don't,' he retorted, 'I mean just what I said—assessable; who's selling these trucks, you or me?'"

"Exhilarators" and "Accelerators."

"Also," continued Reilly, "did you ever notice how many people demonstrate their knowledge by talking about 'exhilarators'? More than half the chauffeurs use it; in fact, the men in my shop, I found, were using it almost entirely, and to get to them all at the same time, I posted a notice in the shop explaining that the little lever that, when depressed, makes the car jump ahead is the accelerator—'ak-sell-er-a-tor,' and not 'ex-il-er-a-tor.' Exhilarator may express in a general way what causes the feeling of the owner when he pushes the accelerator, but the engineers never intended the name to be used in connection with the device.

"Many salesmen and a big per cent. of owners mix up these terms. If you don't believe it just keep your ears open and see how the words are pronounced. A salesman who isn't any better informed than that is quite likely to make an unfavorable impression on a prospect, provided the prospect knows the difference. Ignorance of little things, such as pronunciation, and exaggeration are in about the same class; either may prejudice a prospect."

Just then a little girl, whose appearance signified little to the Sales Manager, approached the door. But Reilly recognized her at once.

"Here's another of those kids after money for the fair," he said, and when she entered he automatically handed out ten cents. As she left, Reilly added, "There's been a million of them here this week."

"Let's see," computed the Sales Manager, slowly, "a million at ten cents each is $100,000. Must have made a big hole in this week's profits, didn't it?"

"Who said anything about one hundred thousand dollars?" retorted Reilly.

"You did," replied the Sales Manager, "and speaking of exaggeration——"

Used Car Sale Leads to $40,000 Offer.

If every dealer could transact business as has E. A. Brandes, of Hastings, Neb., the used car problem would vanish like the Cheshire car of Wonderland; there would be nothing left of it but a grin. Brandes may have lost money on trading cars, but at present he is so far ahead that he can afford to allow unheard-of prices for some time to come and still be money ahead.

It all came through a real estate deal. One day last fall a farmer from Adams county strolled in and made known the fact that he had a hankering for some kind of a car; Brandes had a used car he was anxious to get rid of, and the farmer had an 80-acre farm 200 miles south of Kansas City, in Oklahoma, that he didn't care whether he kept or not. The farm wasn't much of an enjoyment, and a car would be. The result was that he traded his "eighty" for the used car.

Brandes forgot all about his farm; he thought that so long as it was real estate it would stay there until he went to see it, so he kept at business and the farm had almost slipped from his mind until a few days ago, when it bobbed up with tremendous force—the force being imparted by an offer by wire from an oil company of $34,000 for the property. He thought the telegraph operator must have made a mistake and that the figure should have been $340, and since he did not want to sell for this price he wired a refusal. Two days later came an offer of $36,000, and that aroused his suspicions. He turned the offer down and decided to investigate. He learned then that oil had been discovered on adjacent property. The latest offer was $40,000, with Brandes sitting tight waiting for further developments. At least, such is the story as it comes from Nebraska.

GARAGEMEN UNCOVER THREE ROUTES TO CHEAPER "GAS"

Dinner of New York Association Evolves Varying Propositions—Two Refining Processes and One Utopian Scheme.

Even if the New York Garage Association is seeking some relief from the excessively high price of gasolene, it hardly expected, when it arranged the dinner which occurred Tuesday evening last, 28th inst., that the occasion would bring to light three suggested solutions of the problem, the sponsors of each method being emphatically sure their way is the way to lower prices and bring prosperity. There was some expectation that one proposition, of which the association knew previously, might be indorsed that evening, but in the deluge of propositions nothing has yet been done.

Proposition No. 1 is the one which had been investigated, and on the face of affairs seems the best of the trio; it is advanced by the Hydrocarbon Products Co., of New York City, which claims to have been making and marketing petroleum products for four years in a small way and at about half the cost of the methods used by the big oil companies.

Proposition No. 2 was hardly a proposition, but a statement by William R. Gulick of Jersey City, N. J., who is associated with Harris Hammond of New York City, eldest son of John Hays Hammond, the "Copper King," to the effect that he had evolved a process whereby crude oil with slight refinements could be used as fuel in an automobile motor.

Proposition No. 3 was a mysterious unknown commodity which appeared in the person of S. J. Frank, a New York attorney, and Thomas H. Cochrane, of Allenhurst, N. J., who essayed the role of a political economist and press agent for Attorney Frank. The latter, by the way, has had his picture taken "upon orders of his publicity man," but "he won't let it go out unless he has to." Cochrane permitted a Motor World man to obtain a good look at the photo. Frank, while his "booster" was explaining about the picture, dropped the remark, "Blank is my photographer," and shoved his hands deeper into his trousers pockets.

Frank and Cochrane passed around agreements which many of the garagemen signed; the paper stated that those who signed would assemble to discuss a definite plan for the lowering of the cost of living, in this instance the item of interest being gasolene. Frank's press agent stated that the former has a definite plan for lowering practically all prices throughout the country, that all trades, both employers and employed, along with housewives and numerous other persons and classes, were being interested in the movement, and that chambers of commerce and boards of trade in many cities were allying themselves with the promoters. It was specifically stated that there are "no officers, no dues, no fees."

Frank's weapon in his movement, while not yet disclosed, is both legislative and judicial, and he claims wonderful results will be obtained if the people at large back him up. His press agent stated that Frank is a constitutional lawyer of great ability and able to swing the pendulum of success in the right direction. Details of the scheme were not forthcoming beyond that a meeting is to be held in New York in about two weeks.

Those who submitted proposition No. 2—the hydrocarbon project—were more explicit. Robert Baker, a former Congressman, is head of the company, and he and E. W. Mitchell, another officer, told of the company's work. The business was started commercially four years ago under what is known as the Turner process, which was patented as late as December 10 last under the number 1,046,683, and has been conducted on a small scale in Brooklyn. The process consists of a quick refining of crude oil, even of a very poor grade, with a resultant series of products the cost of which is about half that of the products of the refineries owned by the big oil companies, the time required being but 40 seconds.

One product, of course, is gasolene, and the men from the company stated that it had been tried out in numerous demonstrations and found to be the equal of the present commercial commodity; the promoters desire the garage association to contract for a large supply, in which case manufacture will be commenced on a larger scale and the son of a New York brewer, it is said, will immediately put $200,000 into the business. All that is wanted is an assured market for the first of the increased output. The garagemen are seriously considering the matter. A refinery in New Jersey is planned, and for the time being $100 stock is being offered at a $20 rate.

Gulick's statements were to the effect that he has been operating cars for seven years on what is almost crude oil and that much is to be expected from contemplated carburetter improvements; he and Baker disagreed in their prognostications in that while Gulick said he did not believe "gas" ever would be lower but would be higher, Baker declared the price of the commodity was bound to fall. He said that what made his company a dangerous competitor of the big companies was that the man who controls the invention has refused all offers from the big oil companies and desires to operate for himself. Gulick and his associates are now securing certain patents, and later in the winter, he states, they will be able to make public their plans and processes.

The Turner process, as described in the patent, comprises coils and drums with an apparatus for mixing steam and oil vapor and parts so constructed that distillation may be conducted continuously and economically.

The garage association's dinner, which was served in the Wurzburger Hofbrauhaus, on Broadway, between West 83d and 84th streets, was well attended, and those who founded the organization last fall for the general betterment of the trade expressed gratification; several prominent men in and variously connected with the trade addressed the gathering, but all else was overtopped by the discussion of the gasolene situation.

Poetry that Tells Garage's Merits.

Garages and poetry are supposed to be so foreign to each other that few men have had the courage to attempt coupling them. D. L. Ormsby, president of the Hill Top Garage at 451 West 151st street, New York, however, has donned the red badge of courage and is employing poetry to call attention to the merits of his establishment. It is printed on a blotter, which he has distributed among the car owners in his part of the big city, and that the Ormsby jingle is not half-bad and tells the whole story of the advantages of the Hill Top institution is evidenced by the "poem" itself, as follows:

Our telephone is 3-6-9
With Audubon attached,
For help in an emergency
Our service can't be matched.
Remember, it's the Hill Top,"
The name of our garage;
There's not a post from wall to wall,
Although the place is large.
Our washers and our polishers—
In fact, "Hill Top's" whole crew—
They turn a car out for your use
That can't be told from new.
No soap is used to dim your paint,
Our service is polite;
The crew is on the job all hours
Throughout the day and night.
We've "free cold air" you're welcome to,
Accessories galore,
And all at moderate prices, too—
One could not wish for more.
A specially equipped big car
To tow or to repair
Awaits at moment's notice
Your call to anywhere.
If for a place to keep your car
You've not yet made selection,
Just call on us—it is not far—
We ask your close inspection.
A modern place, right up to date,
Roomy, clean and large,
At honest, although moderate, rate;
That's us—"Hill Top Garage."

SHORTCOMINGS OF SALESMEN

Revelations of the New York Show That Emphasize the Necessity for Being Posted—"Greenhorns" Expensive.

At the New York show there was ample evidence that the fundamental principle of salesmanship—know your goods—had been overlooked in the mental equipment of many of the men on the job.

"Yes, this car is built throughout of chrome nickel steel," said the young man in attendance at one booth where a car priced 'way up in the thousands was being exhibited. "We use nothing but the very finest materials."

"Is this made of chrome nickel steel?" asked the prospect, pointing to one of the pistons that lay on a table.

"Yes, sir; three and one-half per cent. nickel steel is used in that piston, the same as in the rest of the car."

The catalog stated that it was made of the "best grade of pure gray iron."

Harmfulness of Ignorance Apparent.

In another booth a similar lack of definite knowledge was discovered. The man in charge was explaining that the rear axle was equipped with a certain make of bearings when, as a matter of fact, an entirely different type of bearings were being used. Further, when asked where the bearings were located he did not know. When the visitor suggested that a recent advertisement had specified an entirely different bearing he became very much confused and had to resort to the catalog, where he was much chagrined to find that the visitor was correct.

These are but two from a multitude of examples which might be cited to prove that in spite of the wider familiarity with details of automobile construction on the part of the public generally, there is still a very great deal to be done towards the education of so-called salesmen before they are really fit to come into contact with the car-wise public.

Salesman the Point of Contact.

It is the old, old story of the inverted pyramid. The factory spends thousands of dollars advertising the machine, pays transportation of men to and from New York, pays big hotel and expense bills, pays for space at the exhibition hall, likewise thousands of dollars for exhibits that will not stand out, but the whole thing goes to smash when the first prospect arrives and finds that the so-called salesman—the vital point of the contact—does not know what he is selling. As Motor World editorially remarked more than a month ago, an automobile show calls for the best trained and most capable men in the sales organization. It is an expensive place in which to break in "greenhorns."

GARAGE FACILITIES THAT COST LITTLE AND COUNT HEAVILY.

A garage with proper toilet facilities—a garage with warm water at the faucet, with plenty of clean towels to dry hands with, a whisk broom to brush off clothes made dusty by contact with the car, a mirror in which to see that one's hat has not a dent in it, a cloth that he can beg, buy or steal to wipe the oil off his hands—these facilities make a wonderful hit with customers.

No matter how much his car is looked after, there is sure to be some little thing the owner wants to do himself, and it is almost as certain that his hands or his clothes will be soiled in doing it. True, he may have a pair of old gloves to protect his hands, but again he may not, and isn't it true also that the investment required for the several items enumerated is not large, and can you not imagine the merchandising appeal of such necessary conveniences?

The fine art of looking after customers has here a chance for expression at the expenditure of a moderate sum, all of which would come back fourfold. Most any garage could afford it—and make it pay.

VARYING THE MONOTONY OF WINDOW DISPLAYS.

"Position is everything," said someone a long time ago. It is not known what was referred to and it does not very much matter. The saying has been passed along for what it is worth. In the matter of window displays it may be worth very much or very little. It is all according to how one makes it count.

Automobile advertising formerly looked very much the same because every manufacturer used to show a straight side view of his car. In forty advertisements the position of the car always was the same. Then somebody awakened to the fact that if he placed his car differently it would have an attention-value quite distinct from the others. Three-quarter views, head-on views, pictures of life in them, cars amid handsome surroundings became the order of the day. The monotonous sameness disappeared.

The same sense—the sense of sight—is appealed to in window displays. This suggests the desirability and commercial profitableness of frequent changes of position of cars shown. Cars that are always in the same position in the same window, amid the surroundings, become dead and uninteresting to the passers-by. Change the position and there is immediately a new attention-value. Cultivate the habit of shifting the view. If possible, vary the colors of the models shown, vary the models, change the lighting—do anything and everything that will make a pronounced change, keeping always within the limits of good taste and good judgment. If your competitor shows his car in one position, display your cars from another angle. It is worth while. And that is the one big reason for window displays of any kind.

TAKING STOCK OF MIND HABITS

How the Practice May Prove Helpful in Eradicating Dead Notions—Livening "Dull Months" That Do Not Exist.

Habits of mind are very much like habits of the body. They can be acquired without our knowledge. They can be changed and rooted out with intelligent study and persistent effort. They are sometimes good; often bad. Periodical taking stock of them is quite likely to prove beneficial; certainly it can do no harm.

Periodically, men take inventories of stock; they count up their bank balances and check off their sales; then why not count up and check off habits of mind. Possibly there may be found some that might just as well be changed.

Effect of a Change of Mind.

One of the habits of mind that many merchants have acquired is the thought that certain months are necessarily quiet and dull. This is particularly true of automobile dealers. The dull months are taken for granted. And, of course, they are dull—likely to be very dull, too. The thing to do is to get down to bed rock and find out by study of the facts if there is any real reason for the dullness more potent than the habit of mind which has been passed on to someone else. If the facts reveal any business possibilities at all, then it is time for a change of mind.

Certain localities take on colors and shades of thought without knowing how they come about. Everybody lays down. Then somebody who is not tinged by the thought comes along and "cleans up" and everyone wakes to the fact there was much business to be had all the time, only nobody was honestly working hard to get it. Millions of dollars are lost every year to merchants simply because they don't take the "blinders" off their minds and get busy.

"How do you pay your salesmen in winter, during the quiet months?" recently was asked E. W. Steinhart, president of the Cadillac Automobile Co. of Indiana. "We pay them the same in the winter months as any other time," he replied, "and they have got to deliver sales just the same. When men are real salesmen, the fact that there is snow on the ground makes no difference. Our monthly quota stands just the same and our men make good; if they don't they get off the job."

There was nothing more to be said. Salesmen are quite likely to take their attitude of mind from the boss. Therefore, it behooves the boss to take very careful stock of his habits of bind and to eradicate dead notions.

THE VETERAN SALESMAN AND THE WORD "SALESMANSHIP."

So much has been written about salesmanship that is not salesmanship at all that some of the veterans on the firing line are apt to despise everything that creeps into print about their profession. Indeed, some go so far as to loathe the word salesmanship. To them it seems to savor of quackery. Therefore they resolutely shut their eyes and their minds to much that might be of practical use.

"Why, I've been selling goods for years and I stand first in volume of sales for our force; I tell you there is no set of rules that will build a salesman. To my mind adaptability is the great thing," said one of these veterans. "But the greatest thing of all is to know your goods from A to Z, forward and backward, and to believe in them not merely because you know them, but in spite of it."

How Culture Helps Salesmanship.

And this veteran of a thousand fights shrugged his shoulders as he thought once more of the word salesmanship that he does not like. Yet, when one got close to him he found that he was just as receptive as a boy. He turned over the pages of James Lane Allen's "As a Man Thinketh," dug into a few paragraphs, took out his pencil and jotted down the name of the little book and remarked that it was just the kind of stuff he believed in. Then he commenced to recite Kipling's "If." He realized that anything that would help to build his character made him a better salesman. He knew the salesman's need of a stiff backbone and he knew that one way he could acquire reserve force was by making himself master of the thoughts of other men. He had been enriching his mind in just that way for years, and it had all helped to make him the powerful, confident, efficient, high-grade salesman that he is. All of which gives fresh point to the familiar saying, "A rose fresh point to the old familiar saying, "A rose by any other name would smell as sweet."

PROSPECTS PERMITTED TO PASS.

"The man who was not a prospect yesterday is a prospect to-day." This has been a saying in the automobile trade for some time, and in it is a large measure of truth. The neighbor who was not thought to possess sufficient means to own and operate an automobile suddenly drives home one night in his new car. The grocer, the florist, the butcher, who were reckoned out of the automobile purchasing class, go flying past on Sunday in their new cars.

Then is realized the truth of the old saying that a man never knows what he can do until he tries; and it is seen how utterly impossible it is to judge of the financial ability of one's neighbors. Then it is decided never again to rate anybody as beneath the salesmen's attention and some of the people whom it had been decided to forget are left on the list of prospects. The thought occurs that, instead of narrowing down our list of prospects, it is much better to build it up and to proceed on that

Solutions of The Used Car Problem, in Competition for Motor World's Cash Premiums of $50, $25, $15 and $10 for the Best Four Articles Dealing With the Subject.

By F. A. CORNELL, Toledo, Ohio.

Handling the "used car problem" is largely a matter of organization. Any properly directed business is accounted for by methods that indicate clearly the costs, receipts and profits of each of the several departments. The personal stimulus provided by allowing department managers to share in any increase of net profits, from work done under their direction, is now generally regarded as the best scheme for getting maximum results.

The really good man appreciates his own worth and has a distinct idea of proper personal earnings. If he does not profit in reasonable proportion to the volume of business he handles, he sooner or later makes a change.

As the "used car problem" confronts the automobile dealer he should look around for just such a self-sufficient, capable and energetic trader, who may be in his own organization in a minor capacity. If not, go out after the proper person and cut him loose on a real job. Get a man who is first of all absolutely square, who knows automobile values, has initiative and can handle men--both employees and customers.

Put that man at the head of an entirely separate department "Used Cars." Sell to this department the new car wanted at a fair sub-dealer's discount. Put it up to this "used car manager" to determine what should be allowed on the old car. His own income should be absolutely dependent upon the margin in its resale.

This scheme is usable best where the number of "trades" is sufficient to keep a man busy. But, be sure you know before you say "my business is too small." Where the volume is heavy it might actually become a separate enterprise; the used car man taking cars at the prices granted to regular sub-dealers. All "trades" should be turned over to this man. He should not be allowed to handle straight sales, so that he may become proficient and absolutely self-reliant in his own specialized field.

You may say "a sub-dealer's discount is too large, I ought to have full profit." One dealer, six weeks ago, had forty-five used cars on hand, their value representing a fair year's profit. The interest on the money tied up would pay him to have sold the new cars at a generous discount.

Further, this separate department idea is not merely a theory. It has been extremely successful in big city practice and in several smaller towns. One little dealer had a rule never to have more than three used cars on hand at any one time. In other words, he put it up to his sales force to make good their own trades, which they did in order to get such business

Associations of dealers, handling "trades" through an appointed broker, agreements as to price and subsequent notification of such appraisement—all are hazardous through the risk of dealers not keeping faith. Furthermore, these co-operative enterprises are regarded as illegal in some States; for instance, under Ohio's Valentine anti-trust act.

How much better is the plan to develop your own legs and thereafter stand or fall on your own square methods! Then, the injection of a specialist's vital personal interest will work up dollars where pennies never grew before. This man will develop means of overhauling old pleasure cars for light delivery work, ultimately handle his own repair force economically and the dealer will not tie up any capital.

So long as absolute squareness is the keynote, the "used car man" will make money for himself and the associated dealer, building up a paying business from sources previously neglected. Facts can be cited to prove the success of this plan. Hence, even if it seems impossible, try it. One dealer took a twenty dollar man seven years ago and put him on this job. Today the dealer sells more cars than any two of his competitors and the "used car man" has four children raising celery, ducks and happiness on a paid-up, half acre, suburban home.

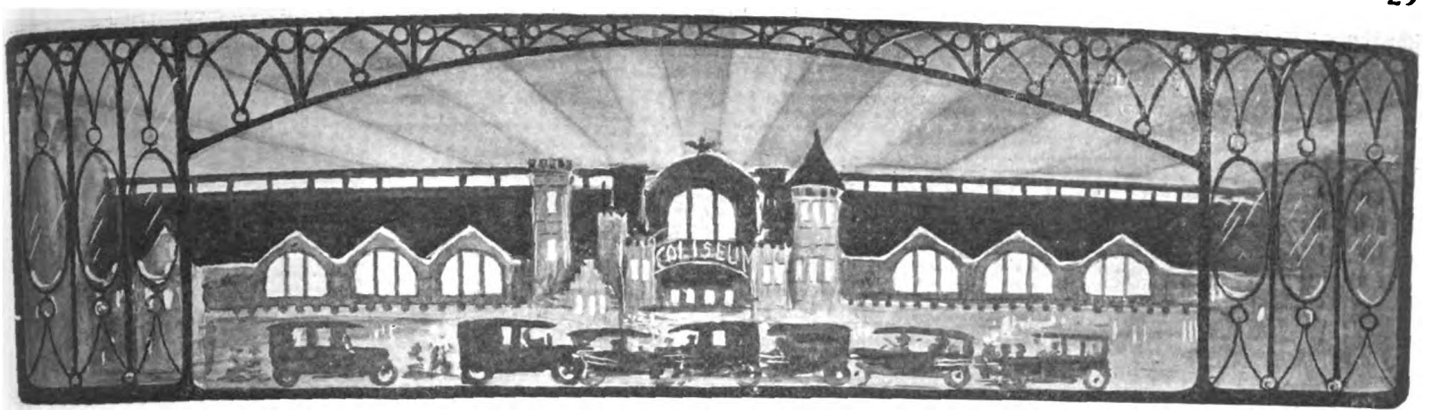
By CHARLES J. BAILEY, Boston, Mass.

It is a significant fact that the most successful dealers have no "used car" problem, and those others who do have it, will find that the solution as far as profit and loss are concerned, will depend on themselves.

There is no reason why a dealer should not take his own cars in trade. He knows, or ought to know, that his cars have a second hand value depending on their age, general reputation, and the territory in which they are sold. Let there be a definite value on the different models, to be allowed if, after inspection, they are in a certain specified condition. After the car has been taken in it should be thoroughly overhauled and sold at a standard price.

The buyer of the old car then knows that he is getting a car in good condition, and the original owner feels that he was allowed the full market value for it when he traded it in. The result is a full commission on the new car and two satisfied customers.

The dealer should set aside a certain amount of money to be tied up in used cars. When this sum has been expended, trading should cease until all the cars taken in have been disposed of. After this has been done he can start trading again, modifying his allowance if the market conditions warrant such a change. This system will at all times give him command of the greater part of his working capital and eliminate any possibility of having a lot of used cars on his hands at the end of the season which would have to be sold at a loss.



The greatest risk is in trading cars other than the dealer's own make. The average individual will go to his own dealer first, when he is in the market for a new car. If his car is one of the standard makes which gives good satisfaction, and he does not buy another of the same kind, it is safe to assume that the old car is in unusually poor condition or he expects an exorbitant allowance. With such a person an outside dealer simply wastes his time trying to sell him.

In many cases, however, the buyer wishes to change because he feels that he is getting a better car. Under those circumstances the best thing the dealer can do is to advertise the old car at the owner's expense and sell it "as is." By adopting this course the owner soon realizes the market value of his car and very often saves a middleman's profit.

It does not seem fair to expect a customer to buy the new car outright and then give the old one to the dealer to sell. Very few people care to have money tied up in an old car any more than a dealer—even though dealers be absolutely honest, the owner would always feel that their interest in selling the old car would just about be proportionate to the effect it would have on their pocketbooks.

If trading allowances are so regulated that the full commission can be obtained on the sale of the new car, the dealer will find that there will be no "used car" problem to solve.

MORE CARS, FEWER ACCESSORIES, FOR CHICAGO

Formidable Display of Electrics Brings Number of Car Exhibits Above New York's Total—Eleven Gas Cars Also Reserved for Western Display—Radical Electric Starter to Make Its Appearance.

In the matter of automobile shows, New York will have nothing on Chicago. One show in two buildings for two weeks, which was New York's portion, stands only a little bit more than knee high to one show for two weeks in three buildings, which is the Chicago program. On Saturday night, February 1st, the top crust of Chicago's automobile pie, which in more polished language is styled the National Association of Automobile Manufacturers' 12th annual show in the Coliseum, the First Regiment Armory and the Wilson building, will be lifted and for the next seven days and eight nights, until the following Saturday night, it will be propped up high, that those who will may view the "filling."

Toothsome "Filling" in the "Pie."

The pie, of course, will be a big one, though it will not be quite as big as the one with which New Yorkers were regaled. In point of number of exhibitors, it will be somewhat smaller—in New York there were 424 separate exhibits all told; in Chicago there will be 322—though the "filling" will be as variegated and just as "toothsome," so to speak. Of the 98 cars exhibits scheduled, 22 will hold cars that were not displayed in New York, and of the 22 no less than 11 are electrics. Which is not altogether surprising, of course, for Chicago is and always has been a great city for electric cars. This year, however, they will not be spread around the show quite as much as they were in other years; they all will be in the Armory, where they can be grouped the better to permit of comparison and they will form a formidable display!

Whether they are in the Armory or the Coliseum or the Wilson building, however, will be all the same, as far as the stage setting is concerned, for the decorative scheme that has been chosen is the same for all three buildings, and it goes without saying that it will be spectacular. What with English country estates, Louis XV decorations and last year's inspiring Mosaic temple, Manager Miles of the N. A. A. M. has achieved a reputation for the unusual and the striking in decorations that it will be hard to beat, though according to present indications the decorators are not having such a hard time of it, after all.

Splendor of Cathedral Effect.

If there is any connection between a Mosaic temple and a cathedral, it is scarcely likely that an automobile show would be suspected of forming the link, palpable or otherwise. But just as last years' Chicago show resulted in the Coliseum being converted into a Mosaic temple, so has the coming show resulted in the Coliseum being turned into a cathedral. Or, at least, it will look a cathedral inside and, according to the decorative effects that have dazzled visitors at previous Chicago shows, there will be no mistaking the intention.

To begin with, there will be a "roof" of some 26 stained glass panels, each 22 feet square, though a view of the classical windows and the rest of the setting is likely to give the impression that the 26 panels really are 260 panels, for there will be great mirrors here, there and everywhere. In fact, the use of the designation "Crystal Palace," not very appropriately applied to that portion of the New York show housed in Madison Square Garden, at one time was contemplated, but out of respect for the prior claim, "hands off!" was the order. The big balcony will look almost as if it is made of stained glass and more of it will be used to distinguish the partitions between the exhibits and the signs that will blazon forth the names of the cars.

In the Armory, which is a few steps from the Coliseum, and in the Wilson building, which is "next door," the stained glass effect also will obtain, though there won't be quite as much of it. Over all, great arc lamps, also enclosed in stained glass, will diffuse soft light, and high lights will be contributed by clusters of red and white globes placed a-top ornamental pillars.

New Accessories That Will Appear.

But to get back to what the show will hold—the total list of exhibitors is 101 names shorter than was the New York list; but every bit of the discrepancy and a little bit more can be traced directly to the accessory people, for Chicago will stage eight more cars than were shown in New York. Altogether, 398 accessory exhibitors held space for the first week of the New York show—the second week of the Chicago show, by the way, will open and close on February 10 and 15th, respectively, and will be devoted to commercial cars, exclusively, and accessories, of course—and only 204 have signed up for the first week of the Chicago show. And if there had not been nine more exhibitors of cars in Chicago than there were in New York, there would have been a still larger difference in the size of the two lists. As it is, the difference is 101.

The difference in the size of the accessory list, however, cannot be construed to mean

Digitized by Google

that there will be nothing new on view. As always has been the case, the Chicago list contains the names of more than a score of Western manufacturers who never exhibit in New York, though their wares are none the less important and none the less interesting because of the fact. Nearly all the names made familiar by conspicuous display at the New York show will be there quite as a matter of course, and the addition of about a score of new names will very nearly make up for the loss in numbers by the increase in variety.

Among the new accessories that will make their debut in the Coliseum or the Armory there are at least three that are calculated to create no end of interest; all three are brand new electric lighting and engine starting systems. The first of them is a clever combination of a gearset and an electric starter from the shops of the Warner Mfg. Co. of Toledo. The second is a new Briggs electric engine starting and lighting system which will supplement the combined lighting and ignition system that made its first appearance at the New York show. And the third is a new Vesta electric starter—or, rather, two new Vesta starters.

Newness That Centers in Electrics.

The list of car exhibitors is complete, of course; not counting the 22 exhibitors who make their first appearance of the year, the makes that appeared in New York will line the walls and fill the spaces of the Coliseum and the Armory and the Wilson building just 76 strong. Nor will all the interest center around the 22 newcomers, if they may be so styled. Quite as much interest will attach to the exhibits marked by names that are familiar to New Yorkers, for though a great many of them virtually will be "transplanted" displays, as always has been the case, a great many of them also will contain features that have been especially "saved up" for Western display. Naturally, there will be no new mechanical features that have not already been described in Motor World's great Before-Shows issue and in the issue containing the report of the New York Show, though it is altogether likely that not a few new body styles will be forthcoming.

Among the new exhibits of cars, electrics make up nearly half of the newness, as already has been stated, though only one of those to be displayed is new, strictly speaking—i. e., the Chicago electric, manufactured by the Chicago Electric Motor Car Co.; it is a standard vehicle throughout; it embodies nothing that is unusual or untried. From the motor, which is liberally proportioned to withstand hard usage, drive is by shaft to intermediate reduction gearing and thence through single reduction bevel gearing to the rear axle.

The remainder of the list of electrics includes the Argo, which is chiefly conspicuous by reason of its own distinctive foot control, the Broc, the Baker and the Detroit, which scarcely have changed at all since last they were exhibited, though several new models have been added to each line; the Borland-Grannis, which from a single model exhibited for the first time last year in Chicago has grown to a line of no less than seven models; the Ohio, the Rauch & Lang, the Waverley, the Century and the Woods. Changes are few in all of them, with the possible exception of the Baker, though even in the Baker line the standard vehicles are much the same as their predecessors. The change in the line is in a new model which has been added and which is quite different from the other Bakers. Taking a leaf out of the gasolene car makers' book, the propeller shaft is enclosed in a rigid tube connected at one end to the motor housing and at the other end to a cross frame member through a large ball and socket joint, thus permitting an unusually free spring suspension. Naturally, all torsion and radius rods are eliminated by the new construction, which is only one of the many new features of the car.

Pleasure Cars to be Exhibited in Chicago, February 1-8

Not Exhibited in New York.

Argo Elec	Glide
Austin	Great Western
Baker Elec	McFarlan
Borland-Grannis Elec	McIntyre
Broc Elec	Ohio Elec
Century Elec	Midland
Chicago Elec	Pratt-Elkhart
Colby	Rauch & Lang Elec
Crow	Staver
Detroit Elec	Waverley Elec
Diamond T	Woods Elec.

Exhibited in New York.

Abbott-Detroit	Marmon
Alco	Maxwell
American	Mercer
Auburn	Metz
Bergdoll	Michigan

Inter-State	Stearns
Jackson	Speedwell
Kissel	Stevens-Duryea
Kline	Stoddard-Dayton
Knox	Studebaker
Krit	Stutz
Locomobile	Velie
Lozier	Westcott
Matheson	White
Marathon	Winton

The list of gasolene cars that have been reserved for the Chicago show reveals even less that is really new than does the electric list, for none of those on it is new in the sense that it never has been shown before. There is the Austin, for instance, which has not appeared in New York for many years and which makes its annual appearance at the Chicago function. Its big six-cylinder motor can be recognized anywhere by reason of the unusual manner of casting the valve pockets catacornered; its upholstery also is likely to be just a little bit deeper than any one else's, judging by last year's show cars.

In the List "Saved" for Chicago.

Crow-Elkhart is another name that is fairly familiar to Westerners, though it very seldom appears on a signpost in an Eastern show. The line will be there in force—there are four different chassis mounting nine body styles and two of the chassis are "sixes" and new. The Glide line is another that is marked by a new model that will make its first appearance. It is styled model "36-42" and mounts a block-cast, long-stroke motor, with cylinders measuring 4⅛ x 5¼. Th larger Glide car—the "45"—also will be there, though there has been found so little room for improvement that there is little that is new in its make-up.

The Colby and the Diamond T are two more Western cars that quite appropriately have been "saved" for Coliseum exploitation, and in the same boat, so to speak, are the Staver and the Pratt-Elkhart. The Staver line has been increased and rounded out by the addition of a "six," though in the other lines there have been no radical changes made. At the Midland booth there will be another new "six" that makes its first appearance and, of course, the familiar "4-40" with its distinctive flexible three-point supported motor will be there. The Great Western is a "four," as it always has been, and the most important change that has been made concerns not the car so much as it does the price, which is $265 less now than it was at this time last year. The McFarlans always have been "sixes," as every one knows; but the McIntyres for the first time will include a "six," one listing at less than $1,500.

Altogether, the list of Chicago exhibitors is a long one and a complete one that requires a great deal more than merely super-

Digitized by Google

ficial examination to bring to light all of its features and all of the features of its varied exhibits. If those who visit the show have one thing more than another to be thankful for, it is that there are fewer stairs to climb to "cover" it than there were in New York. And, incidentally, they will have considerably less ground to travel in getting from one building to the other.

Summary of Cars to be Exhibited in Chicago, February 1 to 8

* Denotes not shown in New York.

Abbott Motor Co., Detroit, Mich.—Abbott-Detroit.

American Locomotive Co., Providence, R. I.—Alco.

American Motors Co., Indianapolis, Ind.—American.

Argo Electric Vehicle Co., Saginaw, Mich.—Argo electrics.*

Anderson Electric Car Co., Detroit, Mich.—Detroit electrics.*

Auburn Automobile Co., Auburn, Ind.—Auburn.

Austin Automobile Co., Grand Rapids, Mich.—Austin.*

Baker Motor Vehicle Co., Cleveland, Ohio—Baker electrics.*

Bartholomew Co., Peoria, Ill.—Glide.*

Bergdoll Motor Co., Louis J., Philadelphia, Pa.—Bergdoll.

Borland-Grannis Co., Chicago, Ill.—Borland-Grannis electrics.*

Broc Electric Vehicle Co., Cleveland, Ohio—Broc electrics.*

Buffalo Electric Vehicle Co., Buffalo, N. Y.—Buffalo electric.

Buick Motor Co., Flint, Mich.—Buick.

Cadillac Motor Car Co., Detroit, Mich.—Cadillac.

Cartercar Co., Pontiac, Mich.—Cartercar.

Case T. M. Co., J. I., Racine, Wis.—Case.

Century Electric Car Co., Detroit, Mich.—Century electrics.*

Chalmers Motor Co., Detroit, Mich.—Chalmers.

Chicago Electric Motor Car Co., Chicago, Ill.—Chicago electrics.*

Church-Field Motor Co., Sibley, Mich.—Church-Field electric.

Colby Motor Co., Mason City, Ia.—Colby.*

Cole Motor Car Co., Indianapolis, Ind.—Cole.

Columbia Motor Car Co., Hartford, Conn.—Columbia.

Columbus Buggy Co., Columbus, Ohio—Firestone-Columbus.

Crow Motor Car Co., Elkhart, Ind.—Crow.*

Cunningham, Son & Co., James, Rochester, N. Y.—Cunningham.

Cutting Motor Car Co., Jackson, Mich.—Cutting.

Davis Carriage Co., George W., Richmond, Ind.—Davis.

Dayton Motor Car Co., Dayton, Ohio—Stoddard-Dayton.

Diamond T Motor Car Co., Chicago, Ill.—Diamond T.*

Edwards Motor Car Co., New York City—Edwards-Knight.

Elkhart Carriage & Harness Mfg. Co., Elkhart, Ind.—Pratt-Elkhart.*

F. I. A. T., Poughkeepsie, N. Y.—Fiat.

Flanders Motor Co., Detroit, Mich.—Flanders.

Franklin Mfg. Co., H. H., Syracuse, N. Y.—Franklin.

Garford Co., Elyria, Ohio—Garford.

Great Western Automobile Co., Peru, Ind.—Great Western.*

Haynes Automobile Co., Kokomo, Ind.—Haynes.

Henderson Motor Car Co., Indianapolis, Ind.—Henderson.

Herreshoff Motor Car Co., Detroit, Mich.—Herreshoff.

Hudson Motor Car Co., Detroit, Mich.—Hudson.

Hupp Motor Car Co., Detroit, Mich.—Hupmobile.

Ideal Motor Car Co., Indianapolis, Ind.—Stutz.

Imperial Automobile Co., Jackson, Mich.—Imperial.

Inter-State Automobile Co., Muncie, Ind.—Inter-State.

Jackson Automobile Co., Jackson, Mich.—Jackson.

Jeffery Co., Thomas B., Kenosha, Wis.—Rambler.

Kissel Motor Car Co., Hartford, Wis.—Kissel.

Kline Motor Car Corporation, York, Pa.—Kline.

Knox Automobile Co., Springfield, Mass.—Knox.

Krit Motor Car Co., Detroit, Mich.—Krit.

Locomobile Co. of America, Bridgeport, Conn.—Locomobile.

Lozier Motor Co., Detroit, Mich.—Lozier.

Marathon Motor Works, Nashville, Tenn.—Marathon.

Matheson Automobile Co., Wilkes-Barre, Pa.—Matheson.

Maxwell-Briscoe Motor Co., Tarrytown, N. Y.—Maxwell.

McFarlan Motor Car Co., Connersville, Ind.—McFarlan.*

McIntyre Co., W. H., Auburn, Ind.—McIntyre.*

Mercer Automobile Co., Trenton, N. J.—Mercer.

Metz Co., Waltham, Mass.—Metz.

Michigan Motor Car Co., Kalamazoo, Mich.—Michigan.

Midland Motor Car Co., Moline, Ill.—Midland.*

Mitchell-Lewis Motor Co., Racine, Wis.—Mitchell.

Moline Automobile Co., East Moline, Ill.—Moline.

Moon Motor Car Co., St. Louis, Mo.—Moon.

Motor Car Mfg. Co., Indianapolis, Ind.—Pathfinder.

National Motor Vehicle Co., Indianapolis, Ind.—National.

Nordyke & Marmon Co., Indianapolis, Ind.—Marmon.

Norwalk Motor Car Co., Martinsburg, Va.—Norwalk.

Oakland Motor Car Co., Pontiac, Mich.—Oakland.

Ohio Electric Car Co., Toledo, Ohio—Ohio electric.*

Olds Motor Works, Lansing, Mich.—Oldsmobile.

Packard Motor Car Co., Detroit, Mich.—Packard.

Paige-Detroit Motor Car Co., Detroit, Mich—Paige-Detroit.

Paterson Co., W. A., Flint, Mich.—Paterson.

48 DEALERS OCCUPY SPACE IN BUFFALO'S 11TH SHOW

Four-cylinder Car to Holder of "Lucky Ticket" a Drawing Card—Green and Gold the Decorative Color Scheme.

"A Four-Cylinder Car to the Holder of the Lucky Ticket" announced the publicity which advertised the 11th annual show of the Buffalo Automobile Dealers' Association, which was inaugurated in the Broadway Auditorium Monday evening last, January 27th, and will continue throughout the present week, and in a measure, perhaps, the phrase was accountable for the crowded show floor which prevails and which has prevailed throughout the week. Each of the numbered tickets sold at the door is a potential prize winner, the prize being an Empire touring car, which is on exhibition.

For the occasion, the building is "all dressed up," so to speak. Green and gold streamers are hung from a central point in the gable roof to the eaves, the streamers of alternate coloring being so closely spaced that the ceiling is invisible from the floor. To the permanent illuminating facilities which are provided have been added myriad incandescents disposed on standards, which also serve to bear signs in the form of shields which announce the titles of the various exhibits. One large decorative piece, a fountain in the form of a lion, faces the main entrance; it is flanked on either side by a high garden wall literally covered with blossoms, which serves both as a draught arrestor and an attractive ornament.

Motor car dealers, 66 strong, have taken all of the available space for the display of as many different makes of cars which they stock. One new accessory in the shape of a folding sheet metal top for converting an open car temporarily into a limousine, and which is made by R. J. Conover & Co., Buffalo, cropped out among the exhibits of the 16 accessory dealers.

The exhibitors of motor cars are: Co-Operative Motor Car Co., Abbott-Detroit, Pope-Hartford, Alco and Stevens-Duryea; Ralph E. Brown Motor Car Co., American, Rauch & Lang, and Winton; Barrett Motor Car Co., Paige-Detroit; Buffalo Electric Vehicle Co., Buffalo Electric; Buick Motor Co., Buick; Kane Motor Supply Co., Cadillac; Louis Engel, Jr., Cartercar; Mason B. Hatch, Chalmers, Stearns-Knight; Joseph Rath, Chevrolet and Little; Cole Motor Co. of Buffalo, Cole; Monroe Motor Car Co., Maxwell, Lenox, and King; Anderson Carriage Co., Detroit Electric; Delaware Avenue Garage & Motor Co., Detroiter; Buffalo Automobile Sales Co., Fiat and Pullman; Werick Bros. Motor Car Co., Firestone-Columbus and Haynes; Meyer Motor Car Co., Flanders Six and Reo; Ford Motor Co., Ford; George Ostendorf, Franklin; Zimmer Motor Vehicle Co., Henderson, Davis, and National; Buffalo-Hudson Sales Co., Hudson; Henry Brunn, Hupmobile and Peerless; F. A. Ballou, Jackson; Buffalo Kissel Kar Co., Kissel-Kar and Simplex; Krit Motor Car Co., Krit; R. G. Danahy Co., Lozier; Mutual Motor Car Co., Marathon; Harry L'Hommedieu, Marion; McFarlan Co., McFarlan; Progressive Motor Car Co., Michigan; J. J. Gibson Co., Mitchell and Empire; Centaur Motor Co., Oakland; Olds Motor Works, Oldsmobile; Overland-Buffalo Co., Overland and Garford; Packard Motor Car Co., Packard; Brighton Motor Co., Palmer-Singer; Pierce-Arrow Sales Co., Pierce-Arrow; Lutz Automobile Co., Premier and White; Regal Motor Sales Co., Regal; J. A. Cramer, Stoddard-Dayton and Marmon; Velie Motor Sales Co., Velie; J. I. Case Threshing Machine Co., Case; Glide Sales Co., Glide; Thomas B. Jeffery Co., Rambler; Mercer Auto Sales Co., Mercer; Poppenburg Motor Car Co., Warren and Imperial; W. P. Smith, Metz; Verbeck & Palmer, Paterson; Yearke Bros., Schacht.

Accessories are shown by: Ajax Tire & Rubber Co., Automobile Insurance Salvage Co., Brussi & Co., R. J. Conover & Co., F. G. Crone, Frontier Tire & Rubber Co., Iroquois Rubber Co., Indian Refining Co., Jaynes Auto Supply Co., Kendall Refining Co., Theo. Meinhardt, Charles E. Miller, Oxypather Co., Pyrene Mfg. Co., Selleck Auto Equipment Co., Wayne Oil Tank & Pump Co.

Trucks Replace Cars at Philadelphia.

Scarcely had the last strains of "Home, Sweet Home," which brought to a close on Saturday evening last, 25th inst., Part I of the 12th annual show of the Philadelphia Automobile Trade Association, died out when the pleasure car exhibits were rolled out to be replaced by the 31 different makes of commercial vehicles, which will hold sway until Saturday evening next, February 1st. Naturally, the decorations in the shape of scenes on canvas which garnish the walls of the Garage Building of the Automobile Club of Philadelphia were left intact.

The commercial vehicles on display are: Gramm, Locomobile, Chase, Autocar, White, Pierce-Arrow, Packard, Garford, Alco, G. M. C., Kelly-Springfield, Wilcox, Devon, Kissel, General Vehicle, Peerless, Commerce, Hewitt, Mack, Saurer, International, Lauth-Juergens, Stewart, Mais, Walker, Detroit, Automatic, Lansden, Webb, Baker, Commercial.

PROVIDENCE DEALERS STAGE RIVAL SHOWS IN SAME WEEK

Forty-four Retailers Constitute Larger Exhibition, Ten the Smaller—One Display in Hotel Ballroom.

Rival shows are on at Providence, R. I. Both were inaugurated Saturday evening last, January 26th, and will continue until Saturday next, February 1st; the larger, which occupies the State Armory, comprises 61 different makes of motor cars, both pleasure and commercial, displayed by 44 dealers and a comparatively large complement of accessory and motorcycle exhibitors, and is staged under the auspices of the Rhode Island Automobile Dealers' Association. The smaller show—Salon, as it is called—is fathered by the Motor Car Dealers' Association of Providence and occupies the ball room of the Narragansett Hotel; the show comprises ten different car exhibits.

The vehicles displayed at the Armory are: Pierce-Arrow, Buick, R. C. H., Alco, Pope-Hartford, Stevens-Duryea, Studebaker, Reo, Packard, Paige-Detroit, Jackson, Mitchell, Krit, Locomobile, Winton, Hudson, Premier, Peerless, Pilot, Chalmers, Knox, Cadillac, Oakland, National, Case, Baker, Stanley, Rambler, Regal, Cutting, Warren, Lenox, Abbott-Detroit, Herreshoff, Speedwell, Nyberg, Stoddard-Dayton, Overland, American, Velie, Cole, Garford, Standard, Franklin, White, Metz, Palmer-Singer and Marion. Commercial cars—Alco, Universal, Peerless, Reo, Packard, Pierce-Arrow, Federal, Bessemer, Pope-Hartford, Mercedes, Daimler, Chase, Palmer-Moore, Mais, I. H. C., Brown, Knox, Modern, White, and Little Giant.

In the ball room show are: Stearns, Mercer, Apperson, Stutz, Hupmobile, Simplex, Fiat, Renault, Marmon and Lozier.

Eighteen Dealers Exhibit at Troy.

"Billikins" and other grotesque statuettes oddly grouped against a backing comprising scarlet and gold draperies, not to mention a pagoda which serves as a bandstand, are the "fixings" which add attractiveness to the third annual show of the Troy Automobile Dealers' Association, which opened its doors on Monday evening last, January 27th, and which will be in full swing until Saturday next, February 1st. Eighteen car exhibits and a handful of accessory displays constitute the show. The cars on display are:

Packard, Cole, Peerless, Pierce-Arrow, Locomobile, National, Speedwell, Kissel, Krit, Maxwell, Buick, Ford, Lozier, Studebaker, Reo, Stearns, Little, Selden.

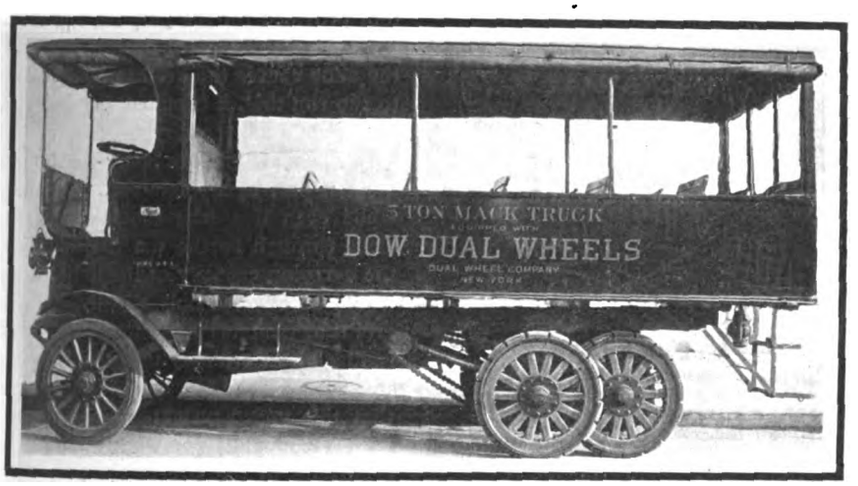
CLAIMS 50% TIRE SAVING FOR SIX-WHEELED VEHICLE

Dow Dual Wheels, Now Ready for Market, Permit Greater Traction and Also Eliminate Skidding —Features of the Design.

After considerable experimentation and much time spent in surmounting the difficulties placed in the path of every inventor of radical ideas, Alexander Dow, of erstwhile tire fame and at present president of the Dual Wheel Co. of New York City, at length has brought to practical perfection the design for a six- or eight-wheeled commercial vehicle, the first inkling of which leaked out nearly a year ago with the incorporation of the exploiting company. From a small demonstrating model, described at the time in Motor World, the idea has borne fruit in the form of a full-sized 'bus which, during the continuance of Part II of the New York Automobile Show, was used as a "ferry" between Madison Square Garden and Grand Central Palace.

In the interim between its first public announcement and its actual public appearance the design has changed in no whit, and in its material aspects the 'bus that exemplifies the inventor's ideas presents nothing more startling than an ordinary vehicle equipped with an extra pair of rear wheels overlapping the usual pair. From which it appears that the original plan to equip both front and rear with dual wheels has been changed slightly and in explanation of the change it is pointed out that, as the weight on the front wheels varies only slightly and is considerably less than that carried by the rear wheels, it has not been found necessary to add the complications required in equipping the front as well.

The idea behind the scheme is not really new, of course, and has been seen in Molesworth's 'buses, in slightly modified form, and in Reeves's Sexto- and Octo-Autos. It was from the Molesworth vehicle, in fact, that Dow obtained his idea, though in working it out to its present form he has found it necessary to deviate considerably from the plans as laid down by Molesworth, whose principal object was to obviate side-slip.

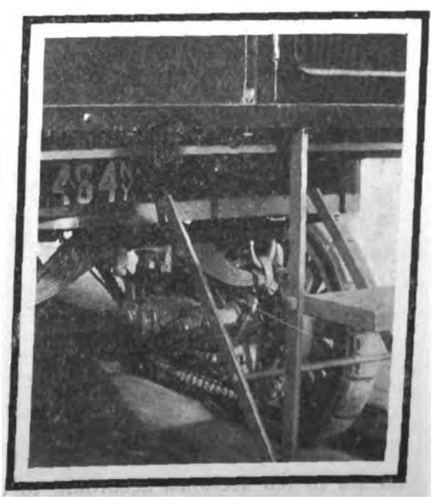


Thus, for instance, Molesworth drove only one pair of rear wheels, whereas Dow drives both pairs, and in this way obtains considerably greater traction than can be obtained where only one pair is driven. The reduction of side-slip follows as a matter of course, for the four tires provide greater contact with the road than do two. In the claims for the construction, however, greatest stress is laid upon the greater traction obtainable with due regard for the consequent increase in braking capacity.

The demonstrating vehicle used by Dow, as the head of the Dual Wheel Co., is a standard five-ton Mack truck that differs from orthodox construction only as regards its rear axle and the additional equipment represented by the two extra wheels. Incidentally, it is pointed out by Dow that the added cost of equipping a vehicle with Dual wheels is so slight—nominally about $100—as to place no serious obstacle in the way of their general adoption.

Making use of the fairly well-known Bogey truck principle, universally used on all steam and electric railroads, each of the wheels in a pair is mounted on a stub axle carried at either end of what has been styled an "equalizing bar, which is carried on bearings at the end of and transverse to the main rear axle; the "equalizing" bar therefore is free to oscillate about the main axle, permitting the equal distribution of the load over each wheel regardless of depressions or obstacles in the road. The "equalizing" bar is in effect a lever of the second class, the net result of the arrangement being that only half the movement of the wheels is transmitted to the main axle.

Road shock therefore is diminished more than half, consideration being taken of the fact that the load is supported on four tires instead of two, which lends point to the claim for lessened depreciation and decreased expense for repairs and the practical elimination of damage or breakage of goods in transit. Similarly, in explanation of the claim for considerably greater fuel economy and for greater economic speed under all ordinary conditions, attention is directed to the fact that less actual effort is required from the engine in forcing the wheels to climb out of declivities in the road or to surmount obstacles.



Power from the engine is transmitted from the jackshaft by side chains to the forward pair of wheels exactly as it is done in the standard truck, the wheels themselves being in exactly the same position with regard to the chassis as they are in the orthodox vehicle. The front wheels are, however, fitted with extra sprockets and drive the rear wheels through the inter-

SIDE VIEW, SHOWING APPEARANCE OF DOW DUAL WHEELS

ACTION OF THE AXLES

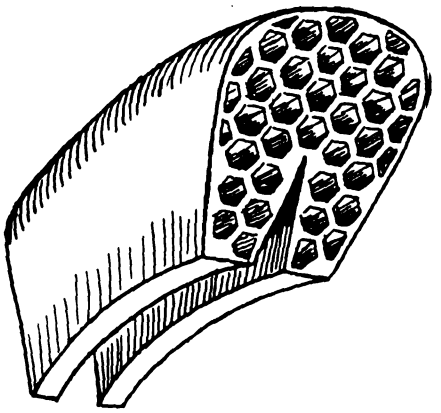
CONSTRUCTIONAL DETAILS

Digitized by Google

mediary of an extra pair of chains. The wheels measure 36 inches in diameter—somewhat smaller than the standard Mack wheels—and are spaced 25 inches from center to center, the construction therefore being compact. The width, from hub cap to hub cap, actually is less than it is on the standard truck, the gauge being 70 inches instead of 71 inches, though the real dimensions might not be suspected by reason of the overlapping of the wheels. Adjustment of the main driving chain can be made in the usual manner by the screw in the end of the radius rod, and there is provision for tightening the drive to the rear wheels by means of an eccentric. There are brakes on all four wheels.

As both pairs of rear wheels always are parallel, in contradistinction to Molesworth's design, in which one pair steered with the front steering wheels, chain drive is entirely practicable. Though it might be supposed that in rounding sharp corners some slight slip might take place by reason of the theoretical and practical difference of direction of the wheels, such is not the case, according to inventor Dow. In explanation of the seeming impossibility, it is offered that the natural distortion of the rubber in the tires is more than sufficient to allow for the difference and effectually to obviate slip, even on the shortest turning radius. In support of the contention, it is stated that the absence of slip may be determined either by observing the rear wheels as the vehicle is rounding a sharp corner, or by cramping the wheels and moving th etruck by hand, when no more effort will be required to move it than is required when the wheels are headed "straight on."

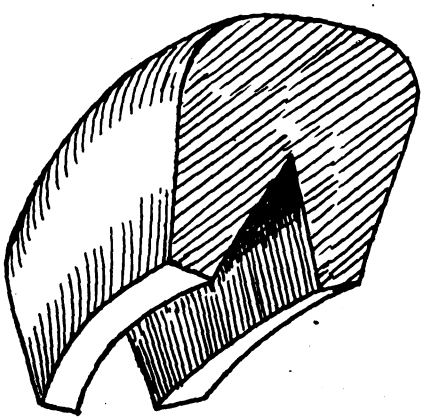
For the present, the Dual Wheel Co. will content itself with the production of a limited number of sets of wheels which will be offered to responsible manufacturers for trial, the ultimate object being the licensing of manufacturers to build the wheels themselves under the Dow patents. Eventually, it is given out, efforts may be made to apply the system to pleasure cars—in fact, plans already have been drawn and a model made showing its application to a wire-wheeled pleasure car—though the near future holds forth no real possibilities of its accomplishment.



Mud That Met a Valve Emergency.

That necessity is the mother of invention and no person can be more ingenious on occasion than the motorist, was emphasized again quite recently by a precarious pickle in which one tourist found himself. He was afflicted with a badly pitted exhaust valve and as he had no valve grinding compound with him he used the next best thing—which was plain mud.

AIRSHIP CONSTRUCTION IN SECTIONAL INNER TUBES



Hexagonal Chambers That Share Responsibility in Roberts Cellular Invention—Extra Weight Offset by Less Equipment.

To eliminate the common, if not particularly agreeable, practice of carrying tires on the running board, and with the storing of spare inner tubes in the tool box, is indirectly the object of the Roberts Rubber Mfg. Co., of New York. In other words, the company is manufacturing an inner tube

ROBERTS TUBE BEFORE SEALING

designed to be proof against blow-outs and indifferent to punctures, these ends being attained, it is explained, by following the example of shipbuilders and of the famous Count Zeppelin in providing a large number of small compartments, each so small

ROBERTS TUBE INFLATED

that its deflation is a matter of small moment. The company was organized several months ago and, as already stated in Motor World, capitalized at $1,000,000, and has equipped a factory at Trenton, N. J., where the Roberts cellular inner tubes are being produced.

A complete inner tube is composed of from six to ten sections, according to the tire diameter, and each section is traversed from end to end by a series of hexa onal air-containing cells, each about ⅜ in i in diameter and separated by walls 1/16 nch thick, as shown in the first illustration The parts are made up with all the cells c sed at one end and open at the other, anc the final process consists in filling them ith compressed air and sealing up the pen ends with rubber, which is vulcanize in place, preventing the escape of the air. The second illustration shows a section infl ed.

In the base of the tube is a V-sh ed groove running from end to end. When the cells are deflated, as in the first illustrat on, the groove is almost closed. The air p es-sure, however, spreads it out; when a t be is put in place in a shoe the groove is cl sed up by bringing the edges together wit a tool provided for the purpose, and the utward pressure exerted against the bead of the shoe causes the bead to hold so tigl tly to the rim that, it is stated, the use of b lts and lugs is unnecessary.

In the event of an ordinary puncture, only a small part of a single section is affected, while even if a tube should be punctured clear through to the rim the difference in the carrying capacity of the tire as a whole would be affected only slightly. The Roberts tube contains about four times as much rubber as an ordinary tube and therefore is four times heavier; but the makers claim that this added weight, which amounts to about 10 pounds per wheel—more or less, according to the size of the tire—is much more than offset by the lightening of the car consequent upon the discarding of extra tires, tubes, pumps, repair apparatus, tire irons and so on. Tubes are manufactured for tires of any size and any style.

To Make Fires "Commit Suicide."

When a motor backfires an dsets fire to gasolene in the pan, or gasolene that has leaked out becomes ignited in any other way, the usual procedure is to throw sand or dust on it, or else to turn a fire extinguisher on the flames, if there is one on the car. A new plan has been evolved, however, by the Inst Lighter Co., of Columbus, O., well known as manufacturers of acetylene lamp lighters. The idea is to make the fire "commit suicide," as the Inst people put it, by hanging a chemical extinguisher having an easily fused plug under the hood on the front of the dashboard. Abnormal heat melts the plug and the contents of the brass cylinder emerge in the form of a gas which expands enormously and envelops everything in its vicinity with a blanket of vapor that will not itself support combustion and keeps off the air. The "Fire Out" extinguisher, as it is called, can be exchanged, when discharged, for one that is fully charged, at a cost of $1.50; the price of the first extinguisher is $5.

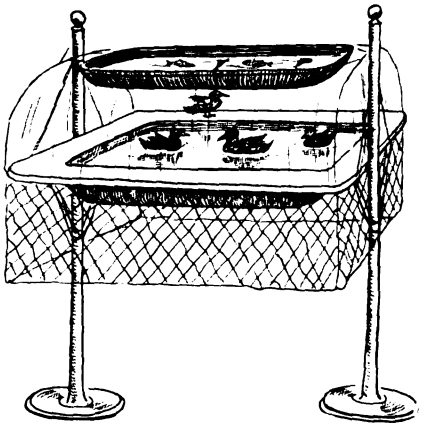
"ACTION" A MEANS OF ARRESTING ATTENTION

Moving Demonstrations That Interest and Hold the Public When Other Methods Prove Unavailing—Automobile Show Reveals Numerous "Stunts" That Are as Adaptable to the Dealer's Uses.

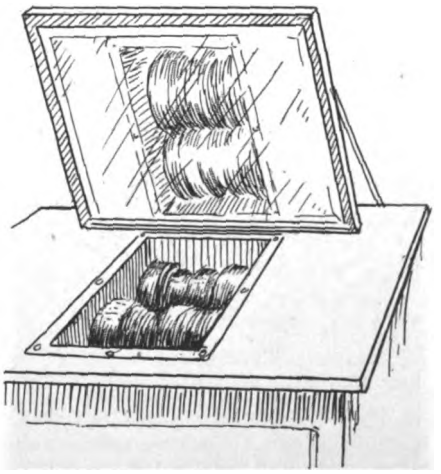
Wherever there is action there's attention.



Attention is what the merchant first seeks to gain from the purchaser; attention secured, sales may result. Wherefore one problem of the business man is to draw attention to his business.

The automobile or accessory retailer, seeking methods of drawing attention, ordinarily would be obliged to cover an extensive territory, viewing the methods of other tradesmen, but an opportunity which is afforded every year wherein the field of search is narrowed to a convenient and constricted area is found at the annual automobile shows, where manufacturers of cars and accessories vie with each other in winning for their exhibits the attention of the passing throng.

Ducks and Fish as Attention Winners.



Ducks and goldfish at an automobile show may seem a far-fetched suggestion to the man endeavoring to devise a novelty for drawing a crowd to his exhibit until the apparent incongruity is explained away, which explanation can be given by anyone who saw the exhibit of William B. Laidlaw, Jr., in the basement of Madison Square Garden, during the show there. Laidlaw is a manufacturer of top and upholstering cloths and the ducks and fish were used in his demonstrations of the waterproof qualities of his fabrics.

As a starter, he erected an iron tubing standard so constructed that the draping of his cloth over rectangles of tubing formed depressions which, with the addition of water, made a couple of miniature ponds. In one of these he placed four ducks and in the other a number of goldfish. The ducks and fish furnished the "action" that served to draw attention to the exhibit, and those who stopped to look necessarily were impressed with the fact that Laidlaw's cloth is waterproof, for the ponds were there night after night, and the under side of the cloth was absolutely dry. A Chinese Mandarin duck, which endeavored to monopolize the whole pond and which pecked at his companions was always a source of amusement. And just as this feature might well serve as a lesson to the public and an attention-arrester in any show window, so there was scarcely an attraction of this sort which might not be adapted by any retailer of cars or accessories, although probably most of the features are better suited to the accessory trade. Also, there may be devised other originalities, just as Laidlaw conceived the idea of making the ducks help tell his story.

DUCKS AND FISH FOR FABRICS

For a movement device which appeals to the car or accessory dealer, the Westinghouse Electric & Mfg. Co., in the Grand Central Palace, presented something unique in a complete lighting and starting system

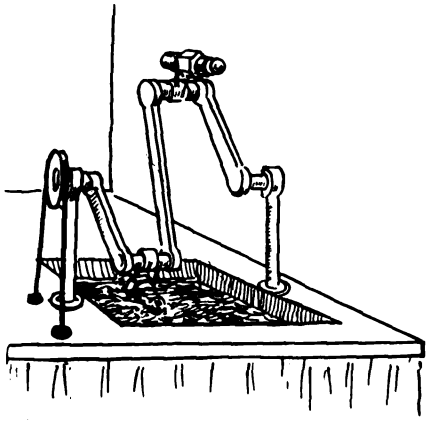
GREASE PERFORMING ITS MISSION

in operation. The bare system was arranged on a long, wide table, headlights, spark plugs, speedometer lamp, attached to a dashboard, controls and the wiring, and a battery was operating the whole system, showing an observer just how it works.

Clever effects, while there was no movement, were achieved by the Gould Storage Battery Co. and the Packard Motor Car Co. The former, at the Palace, was located in front of one of the many big scenic pictures which covered the walls, in this case a summer touring scene with a big car rushing directly into the foreground; behind the painted headlights the Gould company placed tiny lamps, which added an almost startling touch of realism to the scene. The Packard company took advantage of its lighted headlights by placing over them "transfer" pictures of woodland scenes in which the central figure was a Packard car. The illuminated scene served well to show the attractiveness of the car in service and was an ingenious conceit which would show to advantage in any salesroom window.

Moving Gears Educate and Attract.

Never failing to prove educating to those who have an idea what a transmission looks like, but who are a bit vague as to just what is going on inside the case when the car is in motion are the uncovered gearcases wherein the gears are spinning in their thick and yellow baths of grease; a sample of this form of attraction was found in the booth of the Albany Lubricating Co., at the Garden, where a mirrored cover, uplifted, helped force the gear-churned grease into public view. Another exhibitor in a nearby space, the International Acheson Graphite Co., had upon its counter a miniature furnace which glowed with what apparently was an intense heat. Over the top of the furnace was sprinkled graphite, and a card explained that Acheson graphite is made in a heat of 7,500 degrees. Many show visitors put their hands over the furnace, but since a red electric lamp does not give 7,500 degrees of heat none was burned.



In the lubricating line the oil makers varied their methods of getting the public eye. The New York & New Jersey Lubricants Co., on the elevated platform at the Garden, used a device which is so special in construction that, unless it were furnished by the company it doubtless would not find its way to the dealer. It consisted of three sections of mirrored glass, one of which slid from the bottom to the top and bore the lower half of the word "Motorol." When this part was moved up in contact with the

Digitized by Google

section which bore the upper half of "Motorol" the letters were about four inches high, and black. An electric mechanism, however, was so arranged as to cause the lower half to slide down, disclosing black stripes on a mirrored section underneath, making the letter 12 or 14 inches high. While the crowd was watching the completion of this transformation, the black stripes just disclosed were replaced by glass tubes containing various colored oils, and at this instant lights within the sign lighted and a pretty effect was produced; then the lights went out, the sliding glass moved up, and the performance was repeated.

Puzzle Interesting to Everyone.

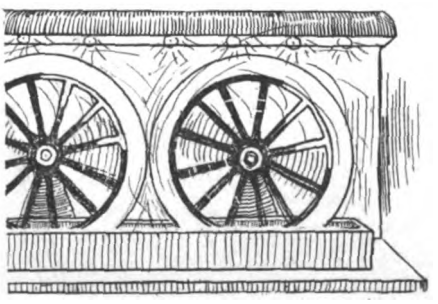
A puzzle or a mystery always interests the crowd and George A. Haws, exhibitor of Panhard oils, took ample advantage of this fact. Also, his device was simplicity itself, being nothing more than an upright, L-

PLUGS THAT SPARKED IN WATER

shaped standard, from the arm of which was hung a half-gallon oil can, tipped at an angle of 45 degrees and the top cut out. Beneath this, upon a bench, was a five-gallon can, and a stream of oil poured continually from the upper into the lower can. Why the upper can never became empty was a mystery which caused a crowd to stand about the Haws booth. Many theories were evolved, but all were guesses; the solution was a little pipe which passed from the bottom of the lower can, down through the bench, up through the standard, through the leather handle which was riveted to the upper can and into the can. A little electric motor and a pump, concealed beneath the bench, did the rest, but to the public it was as mysterious as the first trolley car; they couldn't see what made it go.

The Oilzum people, White & Bagley Co., won attention by a wheel, the spokes of which were glass tubes, backed up by lights, the tubes being nearly filled with oil. The bright and varied colored spokes, with the bubbles rising as the spokes were inverted by the revolving of the wheel, proved interesting; as in practically all of the movement devices, a small motor and belt actuated the wheel. The Havoline Oil Co. has a similar attraction.

Spark plugs are a never failing source of interest, and many exhibitors held throngs in front of their exhibits, watching wierd flashes within dark recesses. The majority of these displays consisted of a system similar to that which causes the timed sparks in

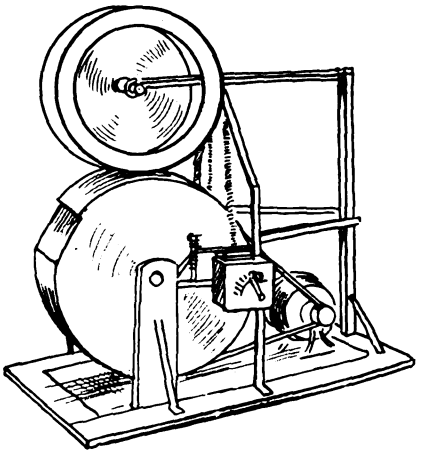


HOMO CARBURETTER DEMONSTRATION

a motor with the flashes in proper order. A. R. Mosler & Co. varied the arrangement by placing six mammoth Spitfire plugs, each about 15 inches long, upon their counter, the sparking ends toward the crowd, and these flashed intermittently, the size of plugs and sparks blocking traffic because of the unusual proportions. Big plugs, also, were shown by the Connecticut Telegraph & Electric Co. and the V-Ray Co., Inc., the latter's plug, which was about six inches in diameter, being made to spark despite a heavy coat of grease, which is highly nonconductive.

Devices that Played up Spark Plugs.

As in the V-Ray exhibits, there were numerous devices to show the ability of the



VALENTINE'S WHIRLING WHEELS

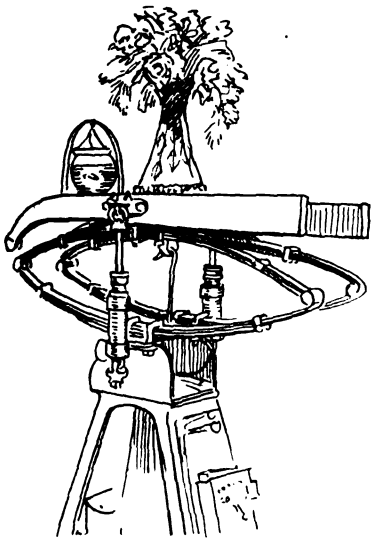
plug to spark under difficulties, the difficulty generally being a stream of oil pouring upon the plug which, nevertheless, kept up its "crackle." In some of these the oil was returned to the upper reservoir by a pump and in others an attendant returned it by hand when the lower receptacle became nearly full.

The Emil Grossman Co. utilized one of the best moving devices in the spark plug line; it consisted of two plugs, each attached to the throw of a two-throw crankshaft and wired to a magneto. As the motor which operated the magneto caused the shaft to revolve, the plugs dipped in a small trough of water, but each time came up sparking as busily as if nothing had ever happened.

Shock Absorbers and "Baby Dolls."

Shock absorbers always afford an opportunity for demonstrations, and both to draw attention and to tell its story the Hartford Suspension Co. displayed its famous "dancing dolls"—two miniature cars, one equipped and one not equipped with Truffault-Hartford shock absorbers, and in each of which was seated a doll. A motor caused drums to revolve beneath the car wheels, and what is likely to happen to the passenger in a car

BUMPING HOME NEWMASTIC ARGUMENT

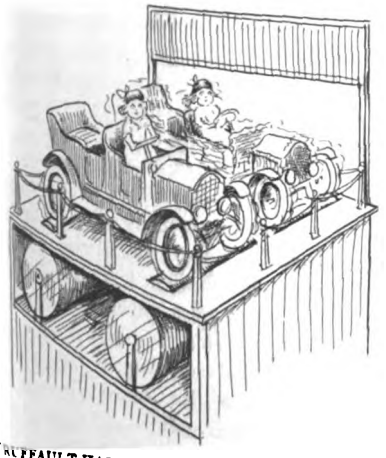


not equipped was hinted at in the way a doll in the unequipped car bounced and vibrated, while the doll in the other car had a comparatively easy time of it. This company also demonstrated its product by an automatic device which compressed and released an ordinary full-elliptic spring, the absorber stopping vibration at one time and the spring being free to vibrate at alternate times. The J. M. Shock Absorber Co. employed a somewhat similar device, except that there was but one car and it contained no dummy passengers, the absorbers being attached and then unattached to show comparative effects.

More cruelty to dolls was performed by the Gabriel rebound snubber. A car body, containing two dolls, was set upon a full elliptic spring which was compressed and released by a mechanism that also alternately attached and failed to attach the snubber. With the snuubber not attached the dolls might never have returned to the car had not there been a connecting line between the seat of the car and the dolls.

Ernest Flentje cleverly drew attention to the ease producing qualities of his absorber

Digitized by Google



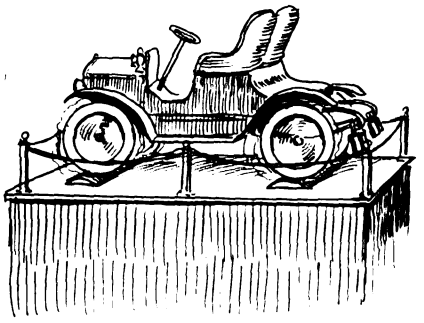
by placing a jar of goldfish and a bouquet of flowers upon a platform on top of a spring; a shock absorber was permanently attached, and when the spring was released after being compressed the bouquet and jar

"UNSHOCKED" FISH AND FLOWERS

of goldfish were not disturbed. In fact, the fish seemed to like it.

The John W. Blackledge Mfg. Co., to give a live demonstration of Velvet shock absorbers, attached one to a three-quarter elliptic spring, mounted the spring between two regulation wheels and revolved a drum underneath the wheels; and while a break in the surface of the drum made the wheels jump at every revolution, the shock

TRUFFAULT-HARTFORD'S DANCING DOLLS



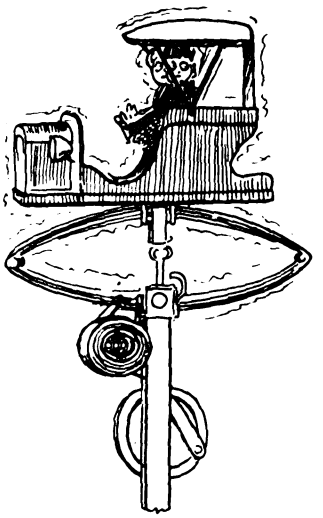
absorber convinced hundreds of people of its ability to take up the undue vibration.

Air and Filler Fooled the Crowd.

Tire filler could have nothing better done for it than was done by the Newmastic Co. The central portion of the device consisted of two wheels, the tire of one being filled with air and the other with Newmastic; the wheels were revolved by a notched drum and were made to carry a load in the shape of springs attached to arms extending from the outer hubs to a stationary post at the rear of the device and the passersby invariamly stopped to guess which was Newmastic-filled and which was air-filled. Judging from the height of jump when the break in the drum hit the tires, vibration and general action, everyone guessed, and there were as many who guessed right as who guessed wrong. The action was almost identical with each tire, and the display did more than anything else probably could have accomplished in persuading the public to consider Newmastic as a substitute for air.

Carburetter Principle on Large Scale.

The Homo carburetter exhibit was calculated to explain how efficient is the little wheel which breaks up and vaporizes the gasolene that passes through this carburetter; up through the bottom of a black-lined box about five feet high, the front being open, projected a tube in which was



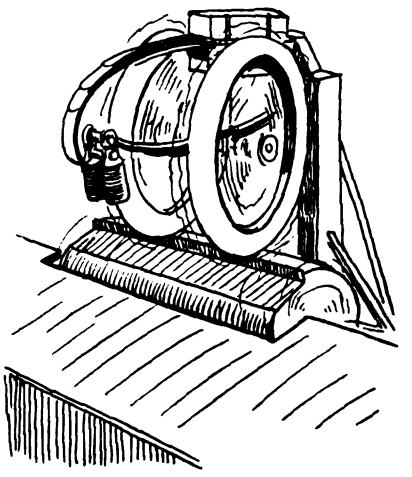
DEMONSTRATING J. M. SHOCK ABSORBERS

one of these little wheels, and water, "more difficult to vaporize than gasolene," as a salesman explained, was sent up into the box in a funnel-shaped cloud of vapor. Electric lights, set into the back of the box, made the vapor plainly visible, and for further effect the salesman held his hand in the cloud and it came out uniformly dampened. A motor underneath was the operating mechanism.

Enlarged Gauge that Taught Lesson.

Besides these, there were many clever publicity "stunts," among them being a big dial tire gauge, shown by the United States Gauge Co., the hand of which pointed, for instance, to figures which indicated that for a three-inch tire the pressure should be 60 pounds, dropped back to zero, pointed next to a combination of 3½ inches and 70 pounds and so kept on with its lesson. The Motometer Co., marketing a new device which attaches to the radiator cap and tells the car operator the temperature of the water, similarly used a big motometer in which a red liquid was made to rise and fall in the temperature tube by means of a motor and pump.

Tobin "Whichway" signals, in the basement, kept flashing "Stop" in red letters, and those who inquired were told that the signal beside the tail lamp lights when the pedals are operated for stopping the car. A revolving octagonal standard in the Goodrich booth turned first one line of sundries



HOW GABRIEL DOLLS WERE "SNUBBERED"

or literature and then another toward the observer, and there were similar devices in other exhibits which, however, would have been doubly effective had there been something besides man power to turn them.

Showing How a Speedometer Works.

Odometers and speedometers in the Warner, Stewart-Warner, and Veeder exhibits

SHOWING ACTION OF VELVET SPRINGS

instructed the public in the internal workings of these more or less mysterious mechanisms and never failed to be observed; in the Veeder booth a revolving wheel caused a hub odometer to register, and in the Stewart-Warner six speedometers were kept running simultaneously, some sectional and others encased. In all of these the construction required was not difficult and, as usual, a motor did the work.

How better to demonstrate the fact that

Digitized by Google

Valentine & Co.'s Vanadium varnish is not affected by soap than to revolve a wheel in a trough of soapy water, alternate sections of the felloe being coated with Vanadium and other varnishes? As might be expected, the Vanadium varnish came up bright and unaffected, while the other varnishes used contracted a bad case of bloom. The wheels, two being used, and a single card with a few words of explanation, told a better story than any salesman could have told to the show crowds—also they stopped to look and read, whereas they might have passed the salesman by.

Everyone likes to see a motor in operation, for many people do not know much about a car's "insides" and a number of car and motor exhibitors took advantage of their electric starting systems to show how power is transmitted to the rear axle, in some instances the chassis being jacked up from the floor and the rear wheels turning. Others showed separate motors turning and the Franklin company, a center of interest because of its air cooling, used a glass-hooded car with small windmills or pinwheels indicating the air currents.

One might not think that much movement or interest could be aroused by ball bearings, but the New Departure people proved otherwise; one of the engineers rigged up a number of small shafts, wheels and belts, and at one end of this power transmission chain placed a tiny electric motor and at the other end a section of shaft turning in bearings, the latter being exposed. Nothing in particular was illustrated except the fact that people will stop to look if for nothing more than just to see a few wheels go around.

Another meaningless but attractive layout was that of J. H. Williams & Co., who caused a six-cylinder crankshaft to so revolve that each time a throw came to the top it made a contact and lighted one of a row of different colored lights.

The king of the puzzle device group was that of the Link Belt Co., which had a number of gears and link belts running on a table and in front of the group a 2½-foot disk in which were inch slots. When this disk revolved at high speed an observer could see through it, but what he saw caused him to wonder if he saw aright, for while all the wheels and belts were spinning when not viewed through the disk, the view through the disk caused some to remain stationary, others traveled normally, and some went backwards. Such a device might easily be made by any dealer, and its installation in a window would necessitate little difficulty. Harold S. Pierce, the engineer who created it, said he got his idea from seeing one revolving electric fan through the blades of another, the second one appearing to be stationary.

Sues Twice for Damage Claim.

Automobile owners are generally supposed to be the ones to worry in negligence litigation, but one instance, at least, where the complaining party found himself involved in still more trouble after the suit was terminated is contained in a suit brought in Des Moines, Ia., by Thomas Clancy against the Strong Motor Car Co. of that city. Clancy secured judgment for $1,800 for injuries sustained when one of the Strong cars struck him and now is suing to get part of this sum from E. J. Kelly, the attorney who conducted Clancy's suit.

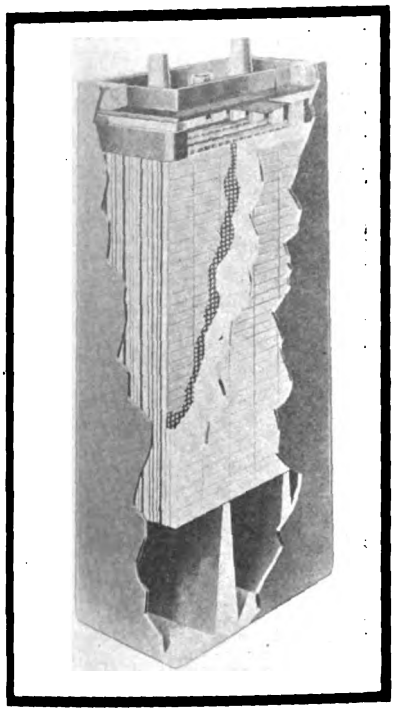
Clancy claims he agreed to give the attorney one-third of the amount secured, while the attorney places the percentage at one-half and, however the deal was arranged, the attorney seems to have come into possession of the money; one point of difference is as to who received the $1,800 check. Clancy claims the lawyer received it and so arranged that he kept half of it, while the attorney alleges that Clancy received the check and turned $900 of it over to the attorney. Kelly also claims the suit is helped on by a grudge borne him by John Newburn, one of Clancy's attorneys in the latest suit.

Miller Evolves a Self-Healing Tube.

The next best thing to preventing a puncture is preventing the loss of air through a puncture, and it was with this in mind that Chas. E. Miller, of the Anderson Rubber Works, Anderson, Ind., devised an inner tube of the self-healing type, in which the pressure of air on soft rubber is made to close up holes.

The Miller tube consists of two concentric tubes of cured rubber, of the same kind as in ordinary tubes, with a space between them which is filled with plastic rubber, which is soft and more or less "tacky." The theory is that when a puncture occurs the air pressure, pressing the rubber, must force it into the puncture, filling it tightly, and that the rolling of the tire over the road increases this effect. It is said that as the layer of plastic rubber is completely enclosed and protected from the air, it will not dry out, but will remain plastic for the life of the tube. The Miller tube is considerably heavier than an ordinary inner tube, containing, the manufacturer states, about four times as much rubber.

Paris Finally Forbids the Cut-Out.



Following the example of other foreign cities, Paris at length has seen the light and henceforth the use of muffler cut-out in the gay city will be considered a misdemeanor.

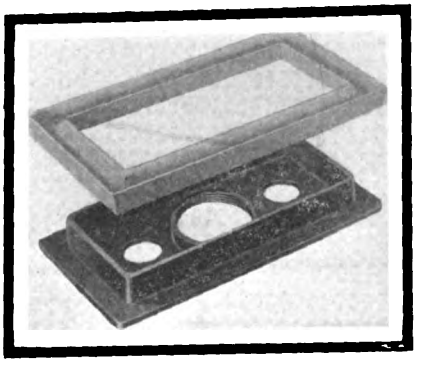
WILLARD RADICALLY REVISES STORAGE CELL CONSTRUCTION

New Method of Sealing, Eliminating Compounds, Adopted—Bolt Connectors Replace Burned Lead Straps—Other Changes.

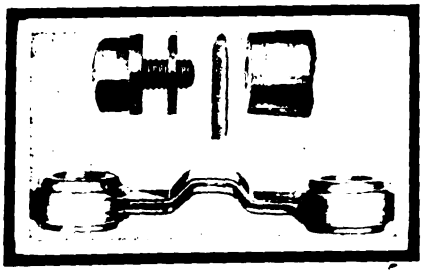
As becomes the acumen of manufacturers who long since saw the light of necessity in the production of special types of storage batteries for automobile illuminating and starting, the Willard Storage Battery Co., of Cleveland, O., has developed and placed on the market a new type of LBA lead-plate vehicle battery the construction of which



HIGH "MUD" SPACE CELL

is so radically different from anything else of its kind as to mark it as one of the few really important improvements that have been made for a long time.

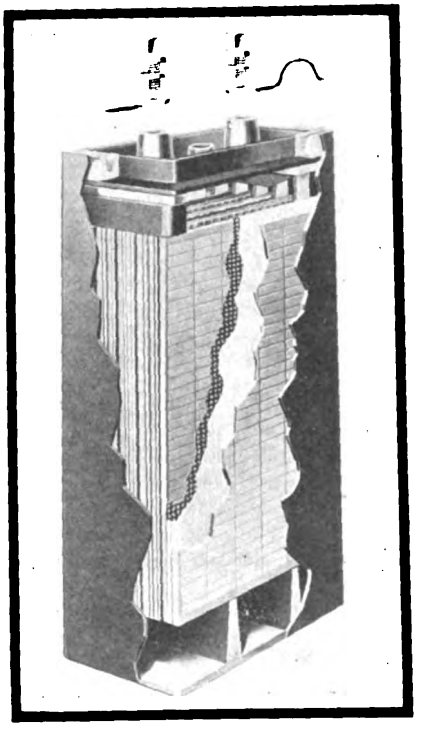
Disrupting more or less firmly rooted battery traditions which have remained in marked contrast to the modern tendency toward simplicity of construction and accessibility, the Willard company, figuratively speaking, has taken the bull by the horns, and bodily cast out sealing compounds and "burned" connections, the net result of the innovation being that the "insides" of the new batteries are infinitely more "get-at-able" than were the "insides" of their predecessors. Instead of the old-style sealed cover, sealed with a black mass which becomes hard only when cold and is semi-fluid when heated, the new cells are sealed with soft pure rubber gaskets and "burned" connectors have given way entirely to an entirely new type of bolt connector.



Some idea of the greater simplicity and accessability of the new LBA cells can be gained by the ease with which it is possible to remove one or more units for repair or replacement, or to remove the whole internal economy for washing. By simply removing the bolts, the cell connectors are

RUBBER SEALING GASKET

released, releasing in turn the covers and soft rubber gaskets, which then may be lifted out, giving quick access for the removal of the cells. Under the old regime when it became necessary to remove one or more cells for equalizing or repair—an operation which is not the least bit uncommon—it was necessary first to dig out the sealing compound—a more or less laborious and dirty job—and then to break the lead connectors in order to release individual cells; of course, if all the cells were to be removed it was necessary to sever all the connectors either by sawing, which is the preferable method, or by melting. From which the simplicity of the new construction becomes apparent.



Among other improvements which have

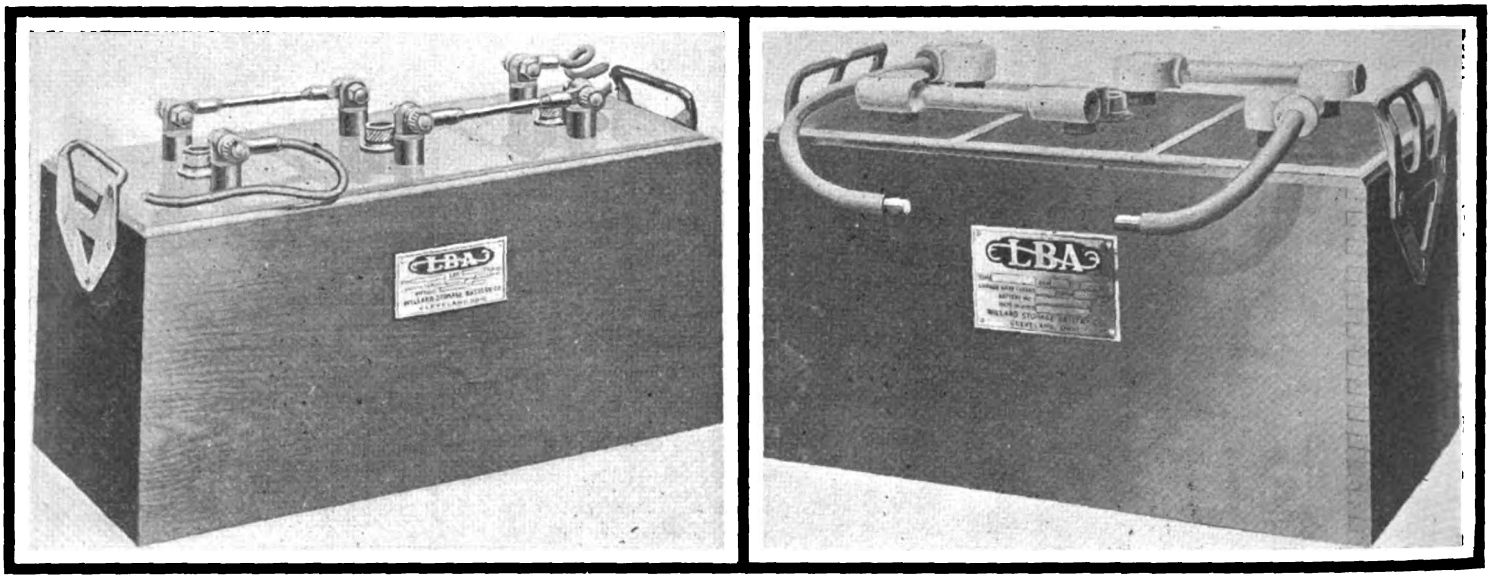
NEW LBA CELL CONNECTOR

been made simultaneously with the adoption of the new method of sealing and connecting, a new type of vent plug has been adopted. It is built upon scientific principles calculated to cause the condensation of liberated gas before it escapes, by breaking the bubbles. Jars are built with heavily reinforced walls to ensure against breakage and are constructed with both standard and deep "mud" spaces. Reflecting the experience of 20 years in the building of vehicle batteries, the plates remain substantially the same and are constructed under processes calculated to make them peculiarly suitable for vehicle work.

In common with a number of other manufacturers, the Willard company supplies its batteries in a number of different types, which vary according to the work for which they are intended. Types J and K of the LBA vehicle batteries, for instance, have heavy plates of standard thickness, such as at first were designed for electric vehicles, and have remained standard for the past 14 years. Cells are made up containing from five to 21 plates, according to the desired capacity, and for those who still adhere to conservative lines the old-style compound sealed covers and lead connectors are supplied; needless to add, both

SHOWING BOLTED CONNECTORS

types also are supplied with the new style rubber seals and bolt connectors.



Permitting greater capacity for the same bulk, types L and M are supplied with medium thickness plates, there being from seven to 23 to the cell. In common with all the others, they are made with both high and low "mud" spaces, the former being calculated to live out its useful life without the necessity for washing by reason of the greater room for sediment at the bottom of the jars. Types N and O contain very thin plates ranging in number from seven to 27, and are designed primarily for use where light weight and great capacity are required, as for instance, in pleasure vehicles.

In the production of batteries intended for lighting and starting work, there are several important characteristics which must of necessity be incorporated in design, and among them high voltage maintenance,

Digitized by Google

slow temperature rise and the ability to maintain output for protracted periods stand one, two, there, respectively. Simplicity of construction and accessibility also are essentials, of course, and it is to all these points that the Willard company draws attention in bringing to public notice the special types of batteries that have been developed for this class of work, experimentation having covered a period of more than five years.

By reason of the fact that lighting and starting batteries generally are expected to withstand unusually hard service and real abuse at the hands of those who are not as familiar with batteries as they might be, Willard batteries are built on the individual cell principle, thus permitting the inspection or repair of one cell of a battery without the necessity of disturbing the others. Further increasing accessibility, all cell connectors are made above the top cover, which construction also operates to reduce to the minimum the possibility of local action between cells. And as there are no exposed parts which can corrode, cleanliness is an inherent feature of the line. The principal characteristic of the starting battery is high efficiency and low internal resistance, with corresponding high voltage when discharged at high rates in order to permit the realization of maximum motor torque.

LBA BATTERIES THAT HAVE BEEN DEVELOPED ESPECIALLY FOR STARTING AND LIGHTING SERVICE

Britishers Begin Study of Benzol.

Aroused at last by the British clamor for benzol in place of "petrol," the price of which steadily is mounting, the Royal Automobile Club has joined forces with the motor Union and the Society of Motor Manufacturers and Traders in the formation of a commission to study and investigate more thoroughly the question of the suitability of the alternate fuel. As is fairly well known, benzol is a coal tar product that on more than one occasion has been suggested as the best means of bringing the gasolene barons to their senses. The work of the commission will be commenced immediately.

Carburetter "Coughs" Caused by Water.

Straining the gasolene may take all the water out of the gasolene, and usually it does so, if a chamois is employed; but nevertheless water not infrequently will come out at the carburetter end of the feed pipe. The reason for this, according to the Rayfield people, is that moisture in the air condenses inside the tank and the water naturally seeks the lowest point in the system—the carburetter intake—and, getting into the carburetter, causes "popping" that often is taken as an indication of too lean a mixture. But the reason is that the carburetter has attempted to handle a little water as it would handle gasolene, and the result is a "cough" or two, after which the engine runs normally till another drop of water provokes more "coughing." The remedy is a separator in the gasolene line.

Frenchmen Evolve Air Transmission.

"The world do move," as some one or other has remarked, though whether it ever will move fast enough to see the adoption of the compressed air transmission remains to be seen. Suffice it to say that the last one seen on American shores was up to its hubs in a beautifully sandy back yard, where it had been abandoned as impracticable after something like $18,000 had been spent in developing it. Despite the difficulties besetting those who attempt such a radical means of eliminating, at one fell swoop, clutch and gears and a whole lot of other parts, however, two Frenchmen, named Personne and Persin, have built such an air transmission, and they are exceedingly sanguine of its possibilities.

In the Personne-Persin arrangement, a special motor has been made with three power cylinders and three air cylinders cast together in pairs in V form. The air engine consists of four vertical cylinders mounted directly on the front axle, which serves also as the crankshaft for the air engine, which therefore is direct connected; speed changing is effected by varying the speed of the compressor, and a large tank is provided for the storage of air under pressure that the whole arrangement may be made "self-starting." Carrying the idea a little further than any of their predecessors, Messrs. Personne and Persin utilize the heat of the exhaust to expand the stored compressed air, thus increasing efficiency slightly.

Fan That Both Cools and Brakes.

Applying a fan brake in a manner that might cause some engineers to open wide their eyes, a firm of foreign car makers which supplies commercial vehicles designed for use in the passes of the Alps mountains, has achieved a wonderful method of construction for which great efficiency claims are made. By way of providing retarding influence to prevent trucks running away with themselves on the steep mountain roads, and also to keep the ordinary brakes and the differential mechanism cool under the strain of continual braking, a big fan brake connected to the propeller shaft is located beneath the chassis and rotating parallel to it. Putting the fan in motion with the aid of a hand lever causes a great displacement of air thus considerably retarding the vehicle. And as the current of displaced air is directed against the wheel brakes, two birds are killed with one stone, so to speak.

ELIMINATING TROUBLE IN LIGHTERS AND STARTERS

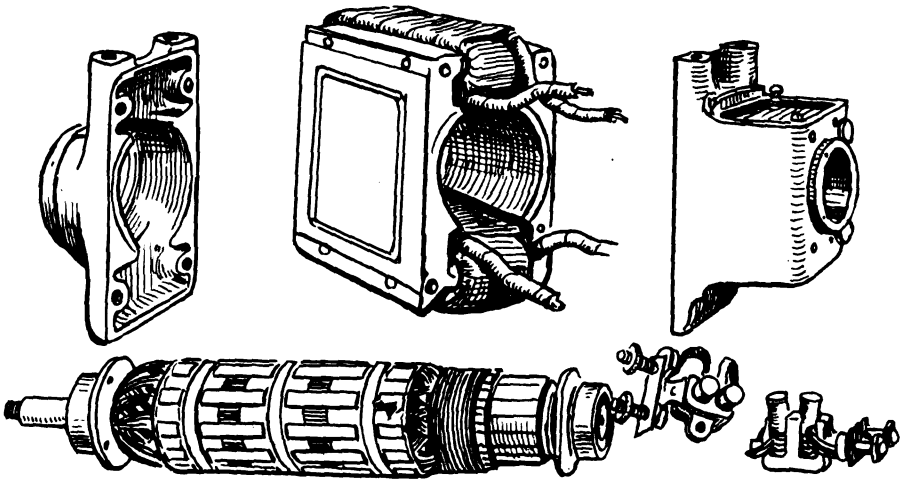
Necessity for Cleanliness and Periodic Inspection if Petty Annoyances Are to be Obviated—Value of Systematic Search in Locating Cause of Failures—Leece-Neville Apparatus as an Example.

(This is the seventeenth of a series of articles designed to make clear the electric lighting and engine-starting systems in use and to render easier their care and repair by the dealer and owner alike.)

"Here," said the enthusiastic owner, "is an electric lighting and engine starting system that I have had for a little over a year; it has always worked well and smoothly, has never failed to start the engine and there always has been plenty of 'juice' in the battery to light the lamps. Within the past week, however, it seems to have gone wrong, somehow or other: I can't get enough light out of the lamps to placate the police—it's the kerosene burners that have sooted the lenses and reflectors up a bit—and the starter gives a most extraordinarily feeble 'kick' when I try to start. Altogether, it appears pretty sick; what's the matter with it?"

Dirt That Causes Much Trouble.

It did not take the repairer very long to discover that both the generator and the motor were dirty—very dirty indeed—that both were mud-splashed, that there were a couple of loose wires and that the commutators were so caked with a combination of oil and carbon dust and ordinary dust that it was almost impossible to distinguish the segments from the insulation. It took several hours and cost in the neighborhood of five dollars to put the equipment in running condition again and, of course, the owner grumbled at the expense. He had been told to let it alone and he had done so, and he could not see why he should be expected to foot the bill.



And yet he had been very careful to see that every other part of the car was cleaned every night—one little spot of mud on the body would result in cause for the washer to quail. The engine was religiously oiled and at least once a week it was gone over with a cloth to remove the most conspicuous portion of the accumulated dust and oil; grease cups were filled and screwed down at regular intervals. If the engineer of an express train upon which he was riding had failed to use his oil can and the train had been delayed half an hour or so to permit a hot bearing to cool, he would have felt like sueing some one. As a matter of fact, the wheels of some locomotives make more than 400,000 turns in 24 hours, but they are oiled and looked after every three or four hours at the outside; and yet, when the manufacturer of electric lighting and engine starting equipment mildly suggests that his apparatus requires a certain amount of care—which, it ought to be understood, is not included in the injunction to let it alone—the advice is likely to be looked at askance. And if it does break down for the reason that it has been too assiduously let alone, and the attention of a repair man is necessary, the manufacturer unjustly is liable to be viewed in the light of the plumber of joke fame.

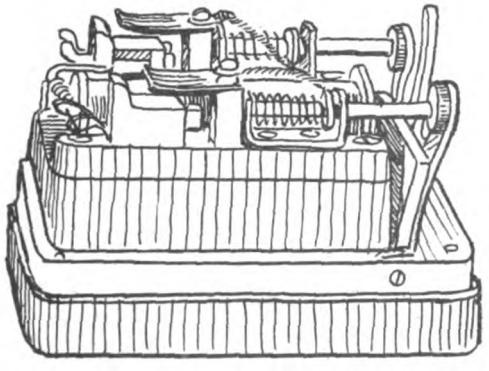
Increasing the Starter's Efficiency.

Periodic inspection, which in the majority of cases can be taken to mean intelligent care, for other than an occasional cleaning and oiling nothing else is required, is absolutely essential if real satisfaction is to be expected—all of which and a great deal more has been made plain in the preceding sixteen articles which have appeared in Motor World; unless the owner is willing to soil his hands occasionally and to exercise his own good judgment in caring for his system, he may well expect that a visit to the repair shop eventually will be necessary, for no piece of mechanism, no matter how good it may be, can be expected to operate indefinitely without any attention whatsoever.

Incidentally, because a new engine as it comes from the factory is "stiff," it should not be expected that an engine starter will work quite as efficiently at first as it will after the engine has been run two or three hundred miles and its bearings have become smoothed down, though it is only fair to add that in few cases is trouble of the kind experienced. Still, thorough investigation of the cause of failures or sluggish action should be made before the system is condemned on general principles.

All of which leads to the thought that there are many ways in which the efficiency of an engine starter may be increased quite easily. The first of these is to make certain that the carburetter is performing its allotted work properly and is not "loafing on the job." Where no engine starter is used, the amount of human exertion required to start a motor may serve as a fairly accurate gauge of the adjustment of the carburetter for starting, and cases are many where failure to start on "one pull-up" has resulted in the adjustment being changed, to the mutual advantage of the owner and the gasolene tank.

LEECE-NEVILLE GENERATOR PARTLY DISASSEMBLED, SHOWING CONSTRUCTION

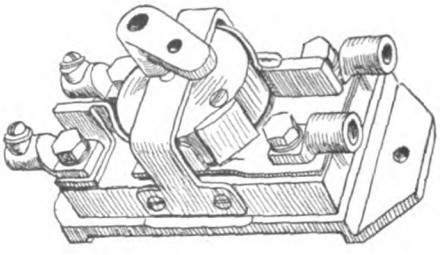


Quite naturally, if an engine is hard to start—if it requires that the engine starter be operated several minutes before the pistons can be induced to commence their labors on their own account—an excessive drain on the battery takes place. Though most of the engine starters on the market will "spin" a heavy motor for almost an hour, which is to their credit, they are not expected to do so by the manufacturer, whose allowance is for but a momentary use of the electric motor at comparatively long intervals. Frequent starts requiring several minutes—one man confesses that often it

Digitized by Google

requires as many as ten minutes to start his engine—deplete the battery very quickly, for it should be remembered that the starting motor draws anywhere from 100 to 150 amperes of current every time the engine is started under normal conditions. Where conditions are abnormal, such as are caused by improper carburetter adjustment, or stiff bearings, the current may be, and generally is, considerably greater.

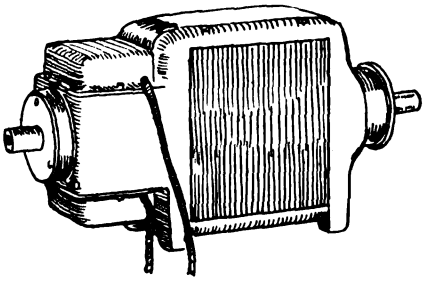
How Adjustment Helps Operation.



Improper carburetter adjustment is the most frequent cause of hard starting, though defects in the ignition apparatus may cause quite as much trouble. Spark plugs in which the gaps are too wide probably cause as much trouble, though it should be remembered that weak batteries also are frequent offenders. Of course, where ignition current is drawn from the same storage battery that feeds the lamps and the starting motor, battery trouble is unlikely, unless the battery has been permitted to exhaust itself, though even then there generally will be enough current to start, provided there is enough to operate the starter.

CUT-OUT IN DETAIL

With a great many systems, the condition of the battery may be judged by means of the ammeter which forms part of the equipment; incidentally, the meter can be relied upon as an infallible tell-tale to indicate whether or not the dynamo is generating and whether it is properly connected to the battery through the cut-out. Because it seldom is used as other than a plain tell-tale, there being very few operators who can read an ammeter intelligently and realize the meaning of the reading, and because there is no real necessity for a meter which may or may not increase complexity, several makers have substituted for it an indicator which operates on the principle of an annunciator. Among them, the Leece-Neville Co., whose equipment is used on Haynes cars and a number of others, has adopted an indicator which is unusual in that it combines the functions of a tell-tale with those of an automatic cut-out. The remainder of the Leece-Neville system is of the two unit type, in which the generator and the starting motor are separate machines.

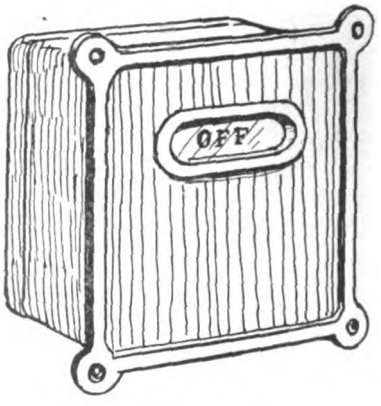


Despite the apparent complexity of the combined indicator and cut-out suggested by the designation, it really is a very simple device, as may be seen by the accompanying illustration, and there is nothing in it that need ever require adjustment. As a matter of fact, it may be placed on the dash, which is its logical location, and left severely alone, the arrangement of the contacts being such that practically no wear can take place and perfect electrical connection is ensured for the life of the mechanism.

STARTING SWITCH

Annunciators Instead of Meters.

In its essential elements, it consists of a U-shaped magnet with the energizing coil contained within the arch of the U; the armature is hinged at one end and the other end is extended to form two "legs" which press against two spring-returned plungers carrying contacts; the other contacts are stationary, of course. A third "leg" between the other two serves to actuate an arm carrying the indicator, which is inscribed with the two words, "Off" and "Charging." In the illustration, the "target," as the indicator is styled, has been omitted for clearness in showing the remainder of the mechanism.



LEECE-NEVILLE DYNAMO

In the design of the system, it is provided that the generator shall commence to charge the battery immediately the car speed reaches 10 miles an hour on high gear. Consequently as soon as the current generated by the dynamo is greater than the battery current, which is necessary in charging, the cut-out automatically closes, and, in closing, shifts the "target" so that the word "Charging" appears in the little window in the case. The case, by the way, is completely water- and dustproof, though, as so often has been remarked, it is practically impossible to exclude all dust, despite the greatest of care in workmanship; a certain amount is bound to find its way into the mechanism after a time, because of vibration and, needless to add, it should be removed, the preferable method being by means of a soft camel's hair brush.

Cleaning the Cut-Out Mechanism.

In cleaning the case, however, great care must be taken not to bend the movable contacts, which are slotted to give them springiness and ensure perfect connection. If either one of them becomes bent so that it does not make contact, the device will remain inoperative until its shape is restored. Although the possibility is remote, either of the plungers may stick in its bearings, due to the presence of dirt, which makes plain the necessity for cleanliness if trouble is to be avoided. To obviate sticking, it is not permissible to lubricate the guides, for the reason that the lubricant is likely to work more harm than good by causing accumulations of dust. The movement of the contacts is small in any case, and the better way is to dust out the case regularly.

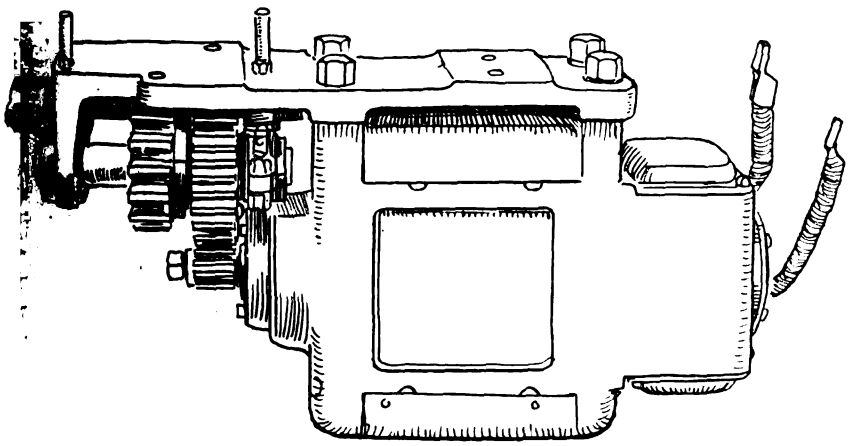
CUT-OUT CASING

As for the contacts themselves, they should never require to be touched, unless, of course, oil has been permitted to get on them, or foreign matter has caused corrosion which prevents proper connection being made. Under such conditions, the remedy suggests itself and consists of a light application of fine emery cloth, until the contacts are uniformly bright. Incidentally, even though the latitude of movement of the contact arms is very small it may be sufficient under the action of continued vibration to loosen some of the wires. Hence it is always a good plan to examine connections when it becomes necessary to open the case for any reason.

In the event that wires have jarred completely loose from their binding screw which, though unlikely, still is possible, the greatest of care must be taken to see th

Digitized by Google

they are properly replaced, for there is nothing that is calculated to cause more trouble than misplaced wires. In common with a great many other manufacturers of such apparatus, the Leece-Neville company supplies a comprehensive instruction book with its equipment, and in the book there are given diagrams of all the wiring. Hence, it should be a comparatively simple matter for even the veriest novice to replace wires as they should be replaced using the diagrams as a guide.



Wiring Simplicity Made Plain.

The wiring of the remainder of the equipment not contained in the circuit breaker casing is a good deal simpler than might be supposed. The battery is rated at 100 amperes capacity and consists of six cells connected on a three-wire system, so that they are charged in series at 12 volts. The lamps are connected on two circuits of six volts each, splitting the battery and the lighting load into two equal parts, and the starting motor operates at 12 volts. Omitting the wires that lead to the lamps, there are only two in the system. They lead from the generator to the battery through the automatic cut-out and from the battery to the starting motor through the starting switch.

The starting switch itself is a very plain and rugged piece of mechanism with big, substantial contacts, as becomes a device calculated to handle very heavy currents. The movable member is circular and when rotated slides two contacts against two others mounted on the base, the arrangement being such that when the central piece is fully rotated, the surfaces in contact are of unusually large area. By reason of the sliding contact obtained, there is no possibility of foreign matter lodging in the mechanism and preventing proper connection being made, hence no trouble from this source can be expected. Also, as the parts all are heavy and strong, it is extremely unlikely that anything short of collision disastrous to the rest of the car could put it out of commission. The only trouble that might affect the device and prevent the starting motor from being operated would be the loosening of the connecting wires. From which it appears that wherever possible the wires should be soldered in place.

Motor and Generator Care Explained.

Except for a difference in the method of wiring, the generator and the motor are exactly like in construction and appearance. The motor is of the plain, series-wound type in which the torque increases with the load up to the point of stalling. That is to say, the greater the load placed on the machine, within prescribed limits, of course, the greater will be the pull exerted. To make it still plainer, if the gasolene motor is very hard to "turn over," the electric motor will work harder to turn it over than it will work if the operation is easier and, of course, it will consume current proportionate to the work performed. Regulation of output is an inherent function of the generator and is obtained by the method of winding; it is not dependent upon any external electrical, mechanical or electro-mechanical devices.

LEECE-NEVILLE MOTOR, SHOWING METHOD OF ATTACHMENT AND GEARING

Of these two elements—the motor and the generator—the motor practically can be forgotten from the beginning of the season to the end, for there is only one moving part in it, it is used comparatively little as compared with the use the generator gets, and consequently is very much less liable to derangement of any kind. It should not be forgotten, however, that cleanliness is next to efficiency—to paraphrase a much-worn proverb—and even though the casing is as dirtproof as it is possible to make it, dust will work in. The dust itself will do little harm provided the machine is not flooded with oil, though obviously it is better out than in. As the commutator shaft rotates in ball bearings, a few drops of fine machine oil about once a month will be all that is required.

The generator, of course, is another proposition, for it is in use continually and is subjected to many times as much wear as is the motor; it should be lubricated a little more liberally, or, rather, a little more frequently—say, twice a month instead of once a month, if the car is driven continually. Also, as the generator is run continually, as long as the engine is run, it will require cleaning more frequently than will the motor, for the reason that the brushes will wear more rapidly and cause a certain amount of carbon dust. The cleaning should be done preferably with a soft brush, provided the dust is not caked on the parts with oil when a cloth dampened, but not wet, with gasolene can be used to advantage. In both the motor and the generator a removable plate over the brushes is provided for inspection of the "works."

Commutator and Brush Attention.

As the armature shaft of the generator runs in ball bearings, the only parts which will show wear eventually will be the brushes, though there is no reason why they should not last at least a season without replacement unless gritty matter has been permitted to find its way into the casing. Under such conditions, however, the commutator is far more likely to show the effects of wear, apparent in scratches or a too bright condition of the surface. Persistence in the use of very fine sandpaper —No. 00—applied while the armature is rotating and after the brushes have been removed will remove scratches from the commutator and restore it to its original condition, provided too much force is not used and the sandpaper continually is moved longitudinally. If too much force is exerted, or the sandpaper is not moved, scratches worse than those it is sought to remove will be the result. After the commutator has been brought to a perfectly smooth surface, a minute quantity of the best quality vaseline applied with a small piece of felt will assist in preserving its finish. Before the brushes are replaced, their ends should be gently sandpapered, care being taken not to disturb the curvature if possible.

If inspection shows the commutator to be smooth, with a high, brownish polish, it should not be touched, for it then is in the best of condition and can be expected to run indefinitely without attention. If it is caked with dust and oil, however, and appears very sticky, the accumulation should be removed with sandpaper applied in the same manner as in removing scratches. As has many times been pointed out, emery cloth never should be used for the purpose, as minute particles of the emery are likely to become imbedded in the comparatively soft coppper and work havoc with both the commutator and the brushes.

MILWAUKEE DEALERS HAVE ONE SHOW INSTEAD OF TWO

Differences Are Adjusted and Combined Efforts Bring About Successful Exhibition—The Cars and Their Exhibitors.

That in unity there is strength amply was demonstrated at the fifth annual show of the Milwaukee Motor Show Association, working in conjunction with the newly organized Milwaukee Progressive Automobile Dealers' Association, which held the boards for a full week, from Saturday, January 11th, until Saturday, January 18th. The concentration of the efforts of the two organizations on the production of a single show instead of upon two separate exhibits, as was first proposed, resulted in a display which filled to the limit each of the four halls which comprise the Milwaukee auditorium building. Of pleasure cars the products of 68 factories were exhibited by 47 dealers, and in the basement were staged the wares of 14 different makes of commercial vehicles shown by as many dealers. Part of the main hall space was given over for the exploitation of the wares of some 18 accecssory dealers.

Decorations were simple but effective. Huge gray tinted pillars with gold captions supported mammoth palms on either side of the aisles and the intermingling of the leaves formed a canopy which covered the passages. Over the booths an arch trellis work bent under the weight of the southern smilax and tree moss with which it was entwined; myriad incandescent lights were disposed to advantage in the foliage. Green, gray and gold were the predominating colors in the draperies. The exhibitors of pleasure cars were:

Wolaeger Auto Sales Co., Studebaker; D. Wittenberg, Carter Car; Packard Motor Car Co., Packard; Cole Motor Car Co., Cole; H. G. Hafemeister, Staver; Oakland-Wisconsin Co., Oakland, Detroiter, Empire; Emil Estberg, Pope-Hartford, Woods electric; Anger Engineering Co., Anger; Wisconsin Auto Sales Co., Herreshoff, Little, Cutting, Chevrolet; American Automobile Co., Pierce-Arrow; Bleinheim Garage, Velie; W. E. Allen Co., MacFarland, Marathon; J. C. Coxe, Stanley; R. C. Rockstead, Warren and Paige; Regal Auto Sales Co., Regal; Archambault Sales Co., Lozier Michigan; Schreiber-Boorse Co., Locomobile, Hudson; Winton Motor Car Co., Winton; E. B. Leverenz, Elmore, Pullman; Mitchell Automobile Co., Mitchell; Kopmeier Motor Car Co., Fiat, Baker electric; E. F. Sanger Co., Marion, Stearns-Knight; Smith-Hoppe Auto Co., R. C. H., Detroit Electric, Chalmers; M. C. Moore, White; Boulevard Automobile Co., Nyberg; Curtis Automobile Co., Reo; J. I. Case Automobile Co., Case; Frank Thompson, Apperson; J. H. Menhall, Abbott; First Avenue Garage, Metz, Davis; Jackson Motor Sales Co., Jackson, Hupmobile; E. H. Peshak, Enger; Krit Motor Co., Krit; E. O. Morse, Crawford; Jonas Automobile Co., Cadillac; Thos. B. Jeffery Co., Rambler; Gas Power Engineering Co., Premier: Kissel Kar Co., Kissel Kar; George W. Browne, Overland, Stutz; Buick Motor Co., Buick; Hickman-Lauson-Diener, Ford; Esbenshade & Teague, Waverly electric; Hustis Bros., Stevens-Duryea, King, Borland Electric; H. Grede, Pathfinder; Imperial Motor Sales Co., Imperial; Hughes-MacDonald Motor Co., Garford, Ohio electric.

The exhibitors of commercial vehicles were: Kubal & Schauer, Commerce; Curtis Auto Co., Reo; Chase Motor Co., Chase; Schreiber-Boorse Auto Co., Locomobile; International Harvester Co., International; Buick Motor Co., Buick; Crown Commercial Car Co., Crown; G. W. Browne Co., Overland; American Automobile Co., Pierce-Arrow; Stegeman Motor Sales Co., Stegeman; Packard Motor Car Co., Packard; Kissel Kar Co., Kissel Kar; Sternberg Mfg. Co., Sternberg; A. McDougal, June.

Accessory exhibitors were: Aermore Mfg. Co., Auto Specialty Co., Wallman Mfg. Co., Auto Supply Co., P. Gross Hardware Co., Feilbach Motorcycle Co., O'Neil Oil & Paint Co., Meile-Blumberg Co., Kemlee Co., General Welding Co., Wadhams Oil Co., Western Fixture Co., Johns-Manville Co., Comet Motor Co., H. D. Plimpton, Milwaukee Rubber Co., Pyrene Co. of Illinois.

Native Dressing for Lynn Display.

With true local pride, the Automobile Dealers' Association of Lynn, Mass., did not go outside of its own State in an endeavor to procure decorations suitable to form a picturesque setting for its second annual show, which held the boards in the State Armory during the week ending Saturday last, 25th inst. Native fir trees, suitably arranged, comprised the decorative scheme. Both pleasure and commercial vehicles, products of 30 different factories, were on view until the doors closed on the exhibit. Fourteen dealers exhibited.

Among the exhibitors were: Seymour Avenue Garage, Inc., Mitchell, Detroiter and International commercial; S. P. Tierney, Buick; Liberty Garage, Hudson and Studebaker and White and Chase trucks; Essex Automobile Co., Flanders, Hupmobile, American, Peerless and Hercules trucks; Eastern Avenue Garage, Ford; M. Plumstead, Maxwell, Stoddard-Dayton, and Columbus electric; P. I. Reynolds, Oakland and Michigan; Fred C. Mitchell, Stevens-Duryea; F. E. Vallier, Velie; E. T. Reynolds, Pope-Hartford; L. D. Robbins Co., Cadillac and Winton; H. M. Jacobs & Son, Pathfinder; E. L. Brown, Mitchell, Abbott-Detroit and Krit; Henry C. Durgin, Jackson.

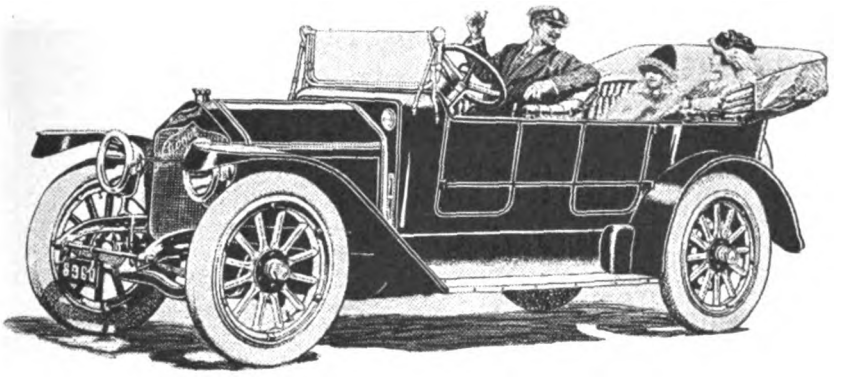
Importers Part of Philadelphia Show.

In an Italian garden setting that was nothing if not befitting, for cars of foreign manufacture were predominant, the Philadelphia Automobile Board of Trade closed its first annual show in the First Regiment Armory, Saturday evening last, January 25th. In all, there were 20 different makes of motor cars exhibited by 16 dealers, and of that number nine were New York importers who exhibited their automobiles at the recent Importers' Salon in New York City from January 2nd to 11th. The others were Philadelphians who held no excess of brotherly love for the Philadelphia Automobile Trade Association, whose show was in full blast in another building.

The list of exhibitors includes: Tioga Automobile Co., National, Nyberg and Hupmobile; Abbott-Detroit Sales Co., Abbott-Detroit; B. H. Kirkbridge, Cutting; Boulevard Garage & Sales Co., Little and Chevrolet; Mercedes Distributing & Importing Co., Mercedes; Isotta-Fraschinni Motor Co., Isotta-Fraschini; F. W. Sewell, Minerva; W. C. & H. N. Allen, Metallurgique; De Dion-Bouton Selling Branch, De Dion-Bouton; Adams-Lancia Co., Lancia; Keeton Motor Co., Ltd., Canadian Keeton; Renault Freres Selling Branch, Renault; Panhard & Levassor Selling Branch, Panhard; L. E. French, Kline and Marathon; Charles R. Taylor, Warren; Frank Parks, Schacht.

Waterbury's Second Exhibit Under Way.

Mayor Francis T. Reeves of Waterbury delivered the speech of welcome which marked the opening on Monday evening last, January 26th, of the Connecticut city's second venture in the show field. As was the case last year, the show is staged in the Auditorium by the Waterbury Automobile Dealers' Association; the doors will swing wide until Saturday evening next, February 1st. The decorative scheme, which embraces the profuse use of tinted bunting and potted plants, is simple in the extreme, which adds rather than detracts from its effectiveness. On the floor are 18 different makes of pleasure and commercial cars, shown by 12 dealers; accessories are displayed by half a dozen sundry dealers. The cars shown are:



Little, Chevrolet, Reo, Overland, Ford, Jackson, Locomobile, Buick, Pierce-Arrow, Metz, Studebaker, Packard, Peerless, Broc Electric, Chalmers, Universal, Moyer, and Stutz.

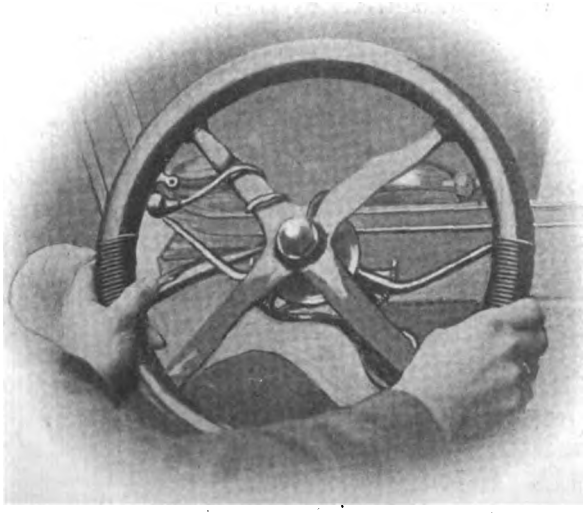
Be a Warm Hand Wheel Dealer



Every week you wait you are missing sales—the weather is here—the desire for comfort is ever present with those who do winter driving for business or for pleasure. Are you catering to demand for Warm Hand Wheels—or are you still waiting?

Here is a new but plainly practical device which keeps cold hands warm under all conditions of cold, rain, sleet and wind. It is simple, easily installed, easily controlled.

The Warm Hand Wheel is not a luxury. It is a necessity on every car that operates between October and May. Its price puts it within the reach of every car owner—and you will find it a ready seller in your territory.

Circuit Open

Circuit Closed

The Warm Hand Wheel is heated by the current from storage batteries or electric lighting systems. Ford owners will find the "built in" flywheel magneto ideal for the purpose. In all cases, a very small amount of current is used.

Dealers who see the future as well as the present of this common sense, comfort-giving device, are getting their territory. It's right up to **you** to get into touch with us now. Write and get the details—learn how liberal your profit will be on each fifteen dollar sale.

Special Guarantee Notice to Motorists

GENUINE DUNLOP Straight Side TIRES

are now absolutely guaranteed against rim cutting during the life of the tire

For ten years' time we have been the exclusive makers of the Genuine Dunlop Straight Side Tire, practically the same in design as it now appears.

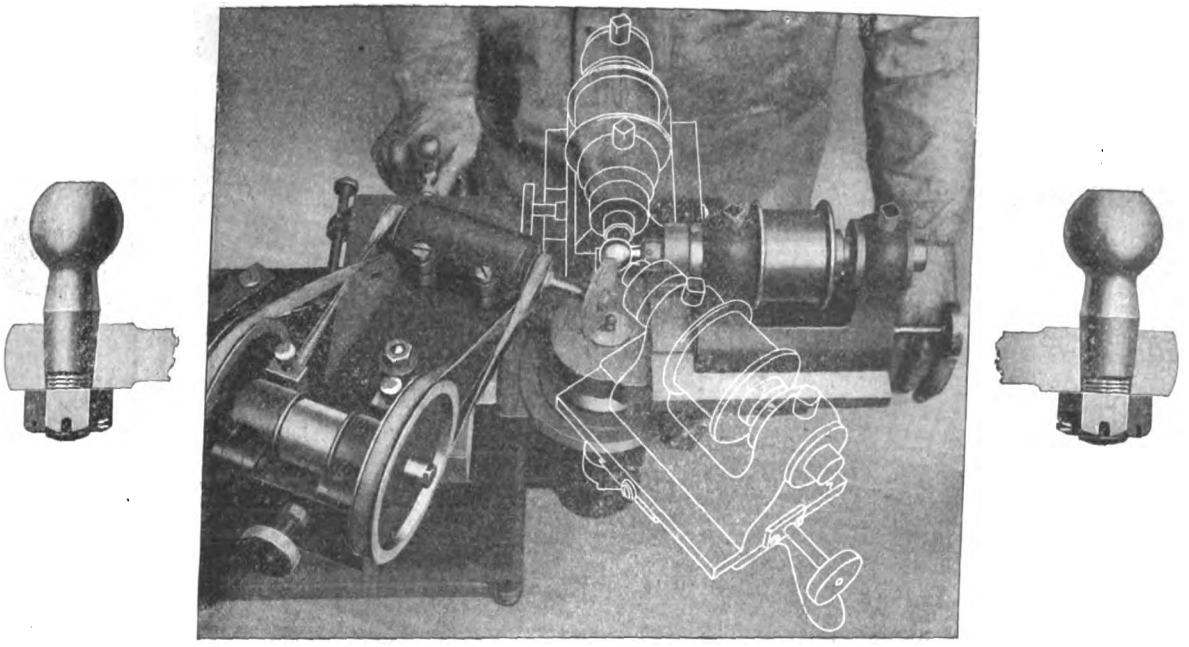
Ten years have proven to us that this tire is absolutely proof against rim cuts under all sorts and conditions of service. Now we back our belief in the Dunlop by an iron-clad guarantee such as no other tire maker has ever offered since tires were first built.

The Genuine Dunlop Straight Side Tires offer the motorists a combination of desirable features that is unmatched in the whole tire field.

1st. **Strength and durability that can only come from our four-factory co-operative method of manufacture.**

2nd. **The easiest tire in the world to put on and take off.**

3rd. **An iron-clad guarantee against rim cuts.**



And remember this, the Genuine Dunlop Tire—the only tire that possesses all the merits of this type, is made exclusively by the

On Trail of the Perfect Sphere

At the end of a long row of grinding machines stands the one that is forming a ball.

It's hot on the trail of the perfect sphere, for on that little steering ball of the front axle depend the life and safety of those who ride in the car.

As you watch, you see the ball spinning and fiery sparks streaming from the rim of the whirling emery wheel.

And back of it all—as in hundreds of other operations—lies a story. The story of faithfulness in the making of

Timken-Detroit Axles

Whenever the motor car changes direction, the steering arms wings back and forth and the ball turns in the socket of the steering connection.

To work perfectly in every position of the arm the ball must be a true sphere. Otherwise in some one position there would be a slight looseness; and vibration would start the ball pounding in its socket.

A little pound would bring more looseness—the extra play would bring more pound. And the trouble would increase more and more rapidly.

When it reached the point where wheels no longer respond to the flash of the driver's thought—it would mean danger.

But if the sphere is perfect there's no looseness at any point and no chance for a pound to begin. The connection starts out right for *every* position and remains right all the time.

To make the roundness of ball a certainty in the Timken-Detroit Axle is the mission of the grinding machine at the end of the row that keeps on the trail of the perfect sphere.

The Self-Starting Six

CONTINENTAL

The Self-Starting Six

These motors were designed since the advent of the electric starter. Any electric starting device can be mounted on the crankcase—due to the crankcase design. These thoroughly tried-out motors are backed by the ripe experience and successful reputation of the entire Continental organization.

Manufacturers will do well to remember the pulling power of the "Continental" reputation as well as the pulling power of "Continental" Motors.

"Continental" Motors have that sure quality, that absolutely defined measure of value, that enables car manufacturers to get a little more for a car when equipped with a "Continental"—and, all the time, you are giving a little more for the money.

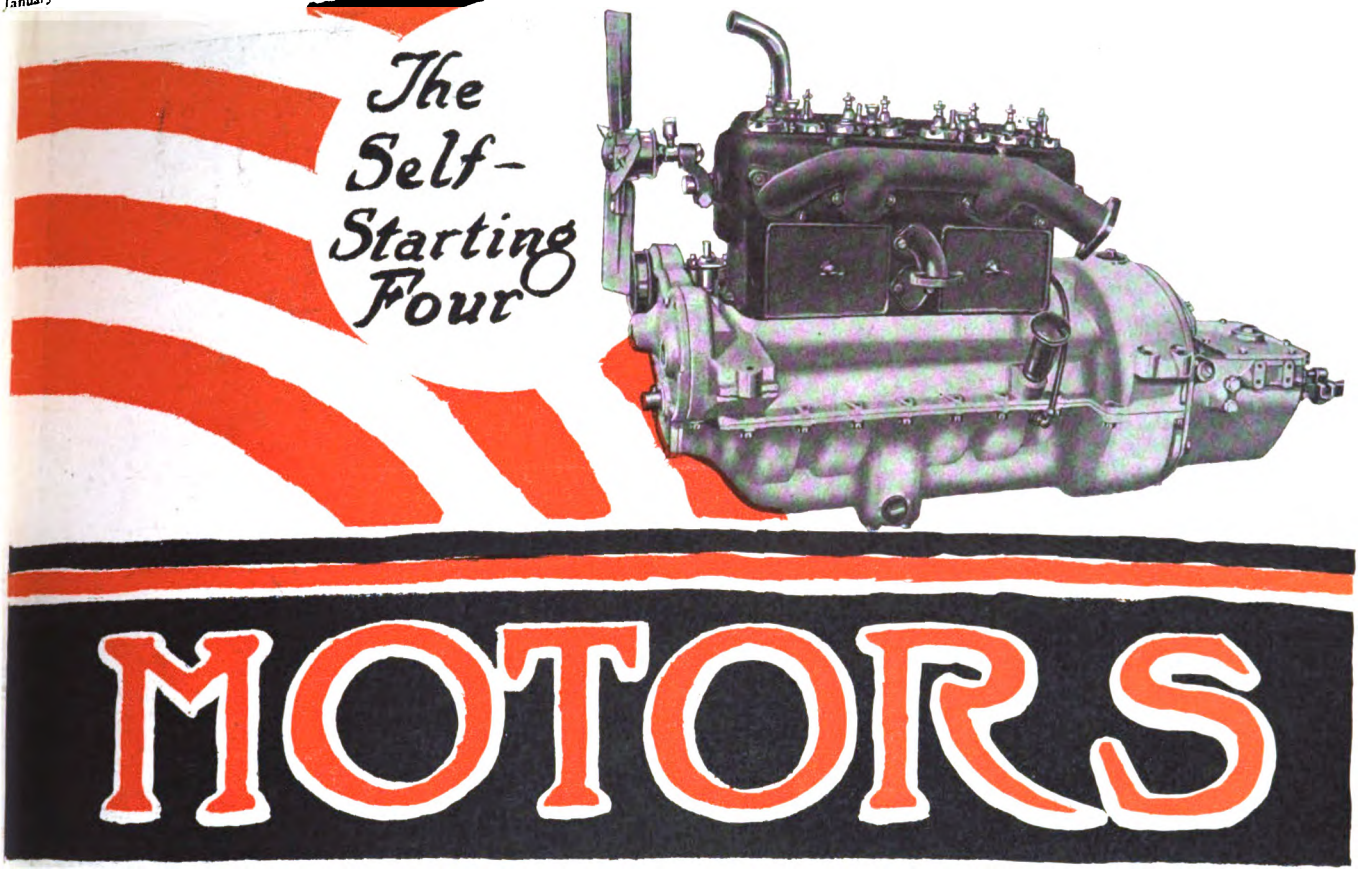
Dealers have found by experience that it is easier to sell cars equipped with "Continental" Motors.

Be Sure and Look for "Continental" Motors at the Chicago Show

Here's the "Little Six" We Promised You

3¾ in. x 5¼ in. bore and stroke—compact, light, powerful—shown for the first time at Chicago. You recall the sensation made by the Continental "Bix Six" at Chicago a year ago; this new "Six" will stir things up again. Don't miss it, and write for further details.

MOTORS FOR COMMERCIAL CARS



This end of the "Continental" business is growing fast. Manufacturers and users both share in the enthusiasm for our Commercial car types—and this enthusiasm is based on the "Make-good" quality inherent in the "Continental" product. We know commercial services and sizes—and "Continental" Motors stand up to the work and take the gaff without flinching. Write for details.

CONTINENTAL MOTOR MANUFACTURING COMPANY, Detroit, Michigan

Digitized by Google

A Word to Car Manufacturers and Dealers

You can utter no stronger praise of your motor than to say it is a "Continental." Concentration on one thing—the building of the best motors that can be produced—has built the "Continental" reputation and made it "solid as the rock of Gibraltar."

No one would think of putting a diamond in a brass setting. Likewise no manufacturer would think of putting a "Continental" motor in a poorly built chassis. This is the reason why you never hear of any but good cars equipped with "Continental" motors. Manufacturers do not buy "Continental" motors because of PRICE but because of known QUALITY, and that quality is an asset that is uniformly backed up by high grade construction throughout.

Look for the Name-Plate "Continental"

Endurance, strength, flexibility and economy are the qualities sought and secured in every motor bearing the "Continental" Trade-Mark. Silence is an incident and follows naturally with right design and careful workmanship.

These are some of the reasons why the name "Continental" on a motor inevitably calls to mind the highest type of motor satisfaction.

Not all the "Continental" motors exhibited at the Show will be found in the "Continental" booth. Look for the little brass plate with the name "Continental." Car builders are just as keen to have it on their motors as we are to put it there. And the one big, vital reason is QUALITY.

CONTINENTAL MOTOR MANUFACTURING COMPANY, Detroit, Michigan

Trucks equipped with the Sheldon Steel Wheels, Axles and Springs have the best commercial car equipment that the hand of man can make or devise.

Our famous steel wheel is positively unbreakable under any conditions of actual service. It weighs less than the artillery wheel and it is easier on tires than any wheel ever before used because of it's light weight at the periphery.

The heat caused by hard service radiates rapidly from the metal of the Sheldon Steel Wheel another reason why trucks equipped with this wheel are easier on tires.

The new Sheldon Axle for heavy service is another Sheldon triumph. It is made doubly strong wherever wear falls and friction is minimized by numerous and scientifically placed oil cups.

We offer these axles to the motor truck industry with the choice of the following bearing equipment:

Standard Taper Roller Bearings
Bower Straight Roller Bearings
New Departure, Rhineland, F & S, Hess-Bright, or any standard Double Row Annular bearings
Single Row Annular Bearings can be applied by using spacers.

This is a great innovation in axle manufacture. We have spared no effort or expense to make our axles perfectly "fit" and the manufacturer who offers a Sheldon equipped truck is giving his customers the most scientific axle equipment that can be made.

"The Easiest Riding Car In The World"

THE MARMON

Marmon "48" Six Cylinder Touring Car

What Service Means

The man who sells many cars is more interested in service than the man who buys one car for his own use.

Conditions are changing.

Over half the buyers of cars this year will be men of experience—men who have owned cars before.

They will not be misled by low initial price—or some one detail of equipment—or the body design. But they will demand service.

The basis of Marmon value is its service.

You may have an idea of Marmon superiority at a glance by the clean-cut appearance of the car—its complete equipment.

Records on track, road and tour in the world's greatest contests, backed by owners' records in service, will teach you more of Marmon value.

A Marmon demonstration will open your eyes to a new idea of easy riding and the operation of the silent, smooth, sweet-running power plant will prove its efficiency.

Years of service but increase the enthusiasm which the demonstration inspires.

And this service in its economy of tires, and upkeep; in its proof of the true wisdom of buying the best; becomes an unapproachable argument for the man who is selling Marmon cars.

The Marmon "Thirty-Two"

Four cylinder, 32-40 h. p., 120-inch wheelbase, electric starting and lighting system, left-hand drive, centre control, nickel trimmings, with newest body types to meet every requirement and corresponding equipment—

$2,850 to $4,100

The Marmon "Forty-Eight"

Six cylinder, 48-80 h. p., 145-inch wheelbase, electric starting and lighting system, left-hand drive, centre control, nickel trimmings, with body types to meet every requirement and corresponding equipment—

$5,000 to $6,350

The FEPS CARBURETOR

"A GIANT IN POWER — A MISER IN FUEL"

IT cannot be denied that one of the weakest points in the gasoline motor today is the carburetor. It has stood still for several years while its neighboring accessories have been striving forward to perfection.

¶ The FEPS carburetor is being produced at the right time to be appreciated by long suffering motorists. It meets an imperative need.

¶ With it the most inexperienced driver can secure 25 per cent. to 50 per cent. more miles per gallon of fuel out of any car than with any other carburetor in the world, without sacrificing one iota of power or speed. It involves a new principle of auxiliary air supply that produces a wonderful increase in flexibility as well as economy and power.

¶ The FEPS contains no springs, no balls, no cams, no reeds and all adjustments once made are permanent. It gives a perfect mixture with any grade of gasoline and is unaffected by altitude, weather conditions or change of temperature. It embodies a new and efficient automatic priming device for quick starting which is especially valuable in cold weather.

Write at once to Department "F" for interesting illustrated booklet. Every reliable dealer should have our trade proposition.

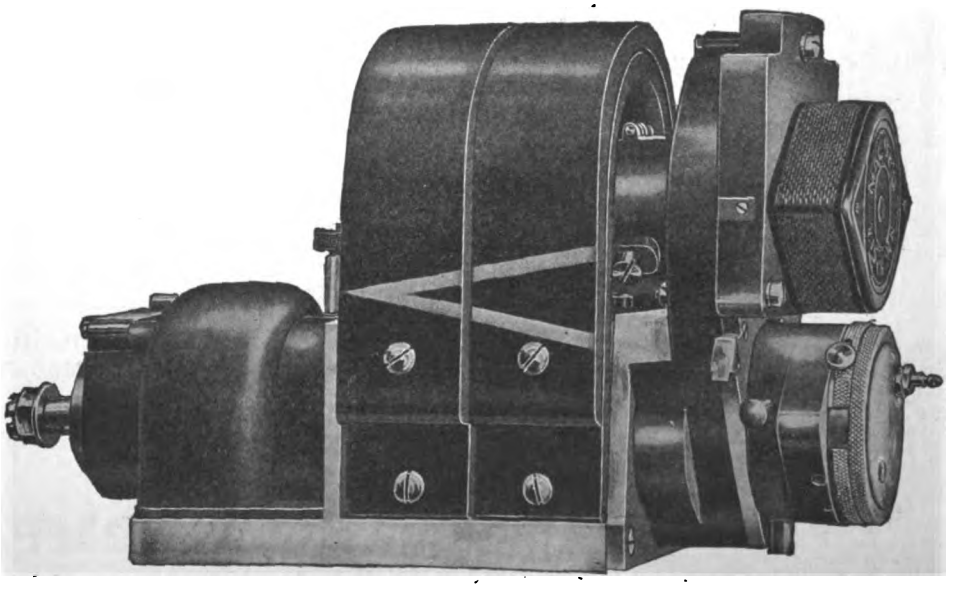
EISEMANN

WHERE efficiency counts most—there you will find the Eisemann automatic spark control magneto in greatest favor. No ignition device ever placed on the market has found such general favor as have all the Eisemann models with automatic spark control, among the makers of the better grades of commercial vehicles.

A motor equipped with this positive and accurate spark control is giving its maximum all the time, insofar as ignition is concerned.



The greatest showing of the wonderful efficiency of this Eisemann device is made when climbing hills under load. Accept the first opportunity you get to climb a hill with a motor hooked up with an Eisemann automatic spark control magneto. Note the power increasing every inch of the way. That will convince you better than words. Or let us know when and where we can give you this demonstration.

"They copied all they could follow,
But they could'nt copy my mind,
And I left 'em sweating and stealing
A year and a half behind."
—Kipling

DEALERS You Can Sell This Car

"The Best of Europe At American Prices"

The Lancia propaganda has taken root and is growing in America—and the reason is mighty obvious.

There is a class, Mr. Dealer, and a restricted one at that, who understands, appreciates and buys this peer of light European cars—(we will send you the names on request).

And there are those in ***your*** territory to whom its combination of strength, efficiency, simplicity and design will appeal.

The Lancia is the best of Europe at American prices—meaning that the purchaser of a Lancia car does not have an extravagantly priced European novelty of freak design—

But a ***real service*** car from Europe—a masterpiece of European design, steel and finish—made and tested in the Alps under the personal supervision of Vincenzo Lancia himself—with a guaranteed value, pound for pound, dollar for dollar greater than that offered by any American or European manufacturer.

Do you want to sell a car of class, service and beautiful design to the fastidious and critical? If you do, then come to New York if possible—see and know the Lancia—or write and let us give you details of the "20" and "30" mounted with coach work in keeping with the chassis.

American Axles

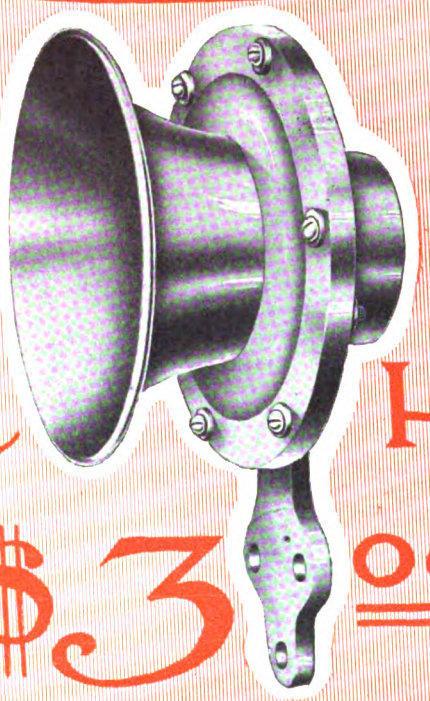
Where Silence Depends Upon Strength

The two hands holding a pinion shaft aptly illustrate an important feature of *American Axle* (bevel gear) construction. Follow the arrows to the bearings on either side of the pinion, firmly holding its shaft in absolute alignment.

Equal results are impossible if the inboard bearing is omitted, just as a single hand cannot hold a shaft in place without vibration and wobbling.

The inboard bearing, with its support and integral part of the housing, is so much better than the cheaper construction which omits it, that *American Axles* are an index to the quality of a car.

Precedence among cars can be safely based upon their use or lack of *American Axles*. They typify the quality which establishes standards for motor cars.



In addition to our Bevel Gear Axles, we hold the exclusive rights as axle manufacturers in America to the Lanchester-Daimler Worm Drive.

CUBIT

ELECTRIC HORN

$3.00

A Good Horn at a Low Price.

In Black Enamel, very High Gloss.

Weighs Two Pounds and a Half.

Consumes very little current (1½ to 2½ amperes).

Emits high toned Musical Blast.

Has no working parts to get out of order.

Has no VIBRATOR, the diaphragm is the Armature.

Requires no Oil. Runs on SIX VOLTS.

Gets better with age as the "Bulging" of the diaphragm which is detrimental to other horns makes the "CUBIT" more efficient.

Extra charge for push button and wire

METALLURGIQUE

Will Sell in Your Community

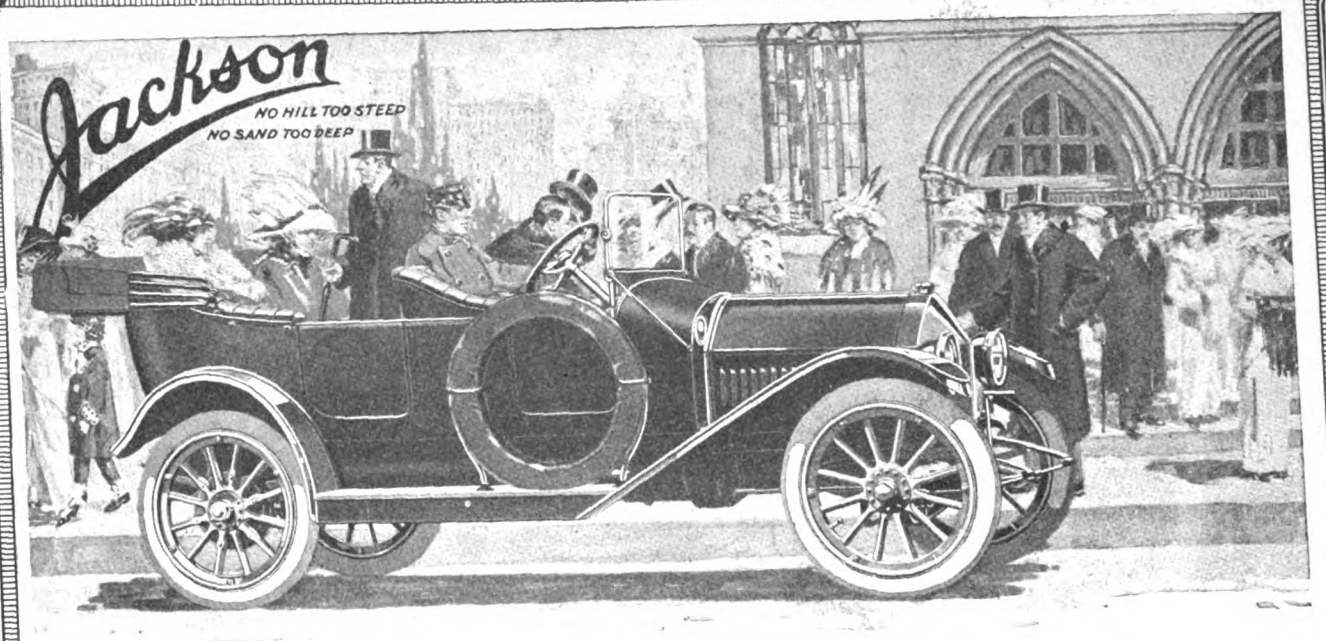
DEALERS

The European Car Idea is Growing in America — is your Ear to the Ground

Dealers who read this announcement will do well to consider the advisability of forming an agency connection with us for handling the Metallurgique—a car for the classes—a distinct and exclusive product, sensational in body design, equipment and appointment. These cars are limited in quantity—unlimited in quality.

From the radiator of unique design to the end of the rear springs—from tire to top, this powerful, unbreakable car offers value in service away beyond that of any other European or any American product. There is a selling argument in every item from steering knuckle to engine.

Luxury of appointments are regal—beauty of design and finish supreme on both sides of the water. Service unlimited.



The Metallurgique is the only logical car for men of wealth and position who desire an equipment that will make all others appear commonplace.

Let us help you find and please and sell to those in this class. As a preliminary, write and get the literature and terms. We can throw more light on the Metallurgique, Europe's choicest product.

Jackson "Majestic" $1,975

Forty-five horsepower, unit power plant; four cylinder, long stroke motor, 4½ x 5¼ inches; 124-inch wheelbase; 36 x 4 inch tires. Full elliptic springs, front and rear. Deep roomy body, with 10-inch upholstery. Electric starting and lighting system, dynamo and storage battery. Equipment of mohair top, top hood, ventilating windshield, speedometer, oil and gasoline gauges on dash, Firestone universal quick detachable rims, extra rim, tire carrier, electric horn, robe rail, foot rest, pump, tire outfit and tools. Black and nickel trimmings.

How the Jackson Dealer is fortified against competition

Three models constitute the Jackson line for 1913—two fours and the splendid new six.

Each is fitted to combat competition in the most telling way—competition in comfort, in ease of riding, in size and power—in everything that influences the buyer.

With three price figures—$1500 for the "Oylmpic," $1975 for the "Majestic" and $2650 for the "Sultanic" six—the dealer has another mighty weapon at hand.

Each model is equipped with a self-starter—Disco for the "Olympic" and electric for the other two, with electric lighting system as well.

But we do not stop there.

We help the dealer by advertising the comfort, convenience, riding ease and silence of Jackson cars in a big, generous way all over the country in the biggest and best national advertising mediums and in the metropolitan newspapers.

In other words, having given the dealer cars he can sell against anything in the market, we help bring prospects to his door.

The attitude of present Jackson dealers is interesting and enlightening.

They are all enthusiastic over the 1913 line.

Every one of them has increased his quota; because every one of them saw the wonderful sales possibilities in the new line.

Most of these men have sold Jacksons for years. Some of them have grown up with the Jackson.

They are men of experience and good business instinct. And with unanimous approval they accept the new Jacksons as the best selling line we have given them.

Dealers who are interested should not delay getting in line for the big spring business ahead of the Jackson.

Jackson "Sultanic" $2,650

Seven passenger, six cylinder, 55 horsepower, unit power plant; long stroke motor — 4⅛ x 4¾ inches; 138-inch wheelbase; 36 x 4½ inch tires. Full elliptic springs, front and rear. Deep, roomy body, with 10-inch upholstery. Gasoline tank under dash supplied with storage tank at rear, with pressure pump. Total capacity, 20 gallons. Electric starter, electric dynamo and lighting system, mohair top, top hood, ventilating windshield, speedometer, oil and gasoline gauges on dash, demountable wheels, extra wheel, wheel carrier, robe rail, foot rest, pump, jack, tire outfit and tools. Trimmings black and nickel. Five passenger, $2500.

Keeton Six Scored Two Triumphs in New York

Six "48" Keeton Touring Car

$2750

Completely Equipped

One Week at Importers' Show—
Next Week at Grand Central Palace—
Side by Side With the Best of Two Continents—
Keeton Six Was Always the Center of Attraction.

Over at the Importers' Show in New York the Six "48" Keeton was the first American car ever exhibited there. It was also the first embodying all the worth while advantages of the European cars made in the economical American way. In that select company the Keeton was the one car that offered the splendid features of the foreign builders at the price which the American buyer knew was reasonable. In this Importers' Salon the Keeton Six was always surrounded by an enthusiastic crowd of admirers—it won immediate popularity.

The next week at the Grand Central Palace the Keeton continued the success which was started so gloriously the week before. Here it was exhibited among the finest products of American motordom. Because of its foreign design it stood out differently from any other car at the show. American designers, engineers, manufacturers and salesmen studdied this model intensely and with some envy. It brought to the dealers' minds many prospects from their territory who wanted a car of such distinctive features and naturally much of the eastern territory was contracted for. Many New Yorkers made their first deposit and begged for the first delivery. Everybody who saw the car in New York talked Keeton.

Last week it was on exhibition at the Wayne Garden Show in Detroit—in the very heart of the automobile industry. Here the popularity continued. Detroiters, the motor wise populace of the United States, were quick to recognize the unusual, attractive features of the Keeton Six. Its long wheel base, 136 inches, insuring easy riding—its long stroke, six cylinder motor, 5½ inches, and its small bore, 3¾ inches, denoting exceptional power and flexibility—wire wheels, 36 x 4½ inches, were just a few of the many superiorities which were pointed out. This week in Chicago, at a place which will be announced in the Chicago daily papers, Keeton will be exhibited, and its triumphs will be continued.

Dealers Will Read This:

It is needless for us to tell you dealers that these cars are selling fast. A good portion of our 1913 output has already been sold, and when we say sold we mean contracted and paid for.

The Keeton is selling fast wherever we are showing it. It has so many superiorities that it is virtually selling itself. There are many prospects in your town who want a car of this type and at this price. If you are at the Chicago Show, see our exhibit, talk to our sales representatives. If your territory is not closed, and you represent the type of salesman we want in your territory, there will be a great opportunity for you.

We have been unable to secure space in the Coliseum Show at Chicago where we can exhibit all the advantages of the Keeton car. The Chicago daily papers, however, will announce the place of our private exhibit. Come in and look the car over anyway.

KEETON FEATURES

Electric starting.
Full Electric Light Equipment.
Transmission—four speeds forward.
Wire Wheels—with option of Wood Wheels.
Chrome Vanadium Gears and Shafts on Imported Annular Ball Bearings.
Extra Detachable Wire Wheel, or extra Demountable Rim.
Long, easy riding Springs—long wheel base, 136 inches
Left Hand Drive—Center Control.
Cylinders cast en bloc, large valves.
Small bore, 3¾-inch—long stroke motor, 5½-inch, of exceptional power and flexibility.
Radiator at rear of motor—in proper and protected position.
The only true French type of car built in America.
Best of foreign practice adapted to American road and touring conditions.

Complete Equipment

Electric starting and lighting system, with 15½-inch head lights; tail lamp with license holder; 80-mile Speedometer and eight-day clock combined with electric light; Lamp for changing tires at night, with extension cord; Dynamo electric Horn; Robe and Foot Rails; Silk Mohair Top, with self-contained folding curtains and slip cover; double acting rain vision Windshield; option of Wire Wheels with extra detachable Wire Wheel, or Wood Wheel with extra demountable rim; Wheel or Tire Carrying Irons; Full Set of Tools; Pump; Jack and Tire Repair Outfit; and all Touring Bodies will take Auxiliary Seats.

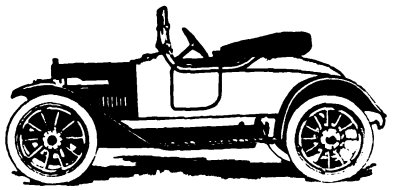
The Gearless Transmission!

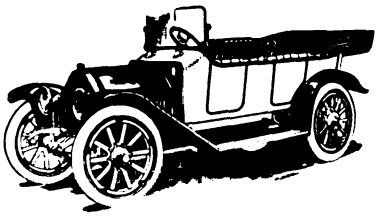


More Efficient—More Reliable

When you consider what the Cartercar will actually do—for every driver—for you—then you realize that it has no competitor from the standpoint of efficiency. It climbs a 50 per cent. hill—runs through deep mud and sand—has unlimited speeds—and requires only about half the usual expense for tires, because there are no jerks or jars.

These features are made possible by the remarkable Gearless Transmission. This is the strongest feature of the Cartercar.

And then think of reliability. Cartercar is simplicity itself. The transmission has only two unit parts—the control is by a single lever—in every detail of construction you find fewer parts than in the ordinary car.



But in addition to having such few parts—the construction of the Cartercar is so unique that almost all possibility of road trouble is eliminated.

Model 5 B

Eleven Facts About Hyatt Quiet Bearings

FACT 1. Hyatt Roller Bearings afford a line (—) bearing instead of a point (.) bearing as is the case with ball bearings. There is more surface to carry the load, yet with but little friction. They are American bearings for American roads.

FACT 2. Hyatt Roller Bearings are flexible. They give under shock, still are rigid enough to carry their load and remain round.

FACT 3. Hyatt Roller Bearings are quiet. Noise is caused by the vibratory motion of any solid substance. Shocks and jars produce vibrations which rigid bearings transmit and intensify. The flexibility of the Hyatt Roller cushions shocks—absorbs vibrations—hence reduces noise.

FACT 4. Hyatt Roller Bearings will retain a large quantity of Lubricant because the rollers are hollow. The spirals in the rollers alternate from right to left, thus constantly distributing the lubricant in all directions over the surface of the rollers.

FACT 5. Hyatt Roller Bearings have no delicate adjustments to be tampered with after the car has left the factory. Carelessness, curiosity or ignorance will not cause trouble by making improper adjustments in Hyatt Bearings as is often the case with others.

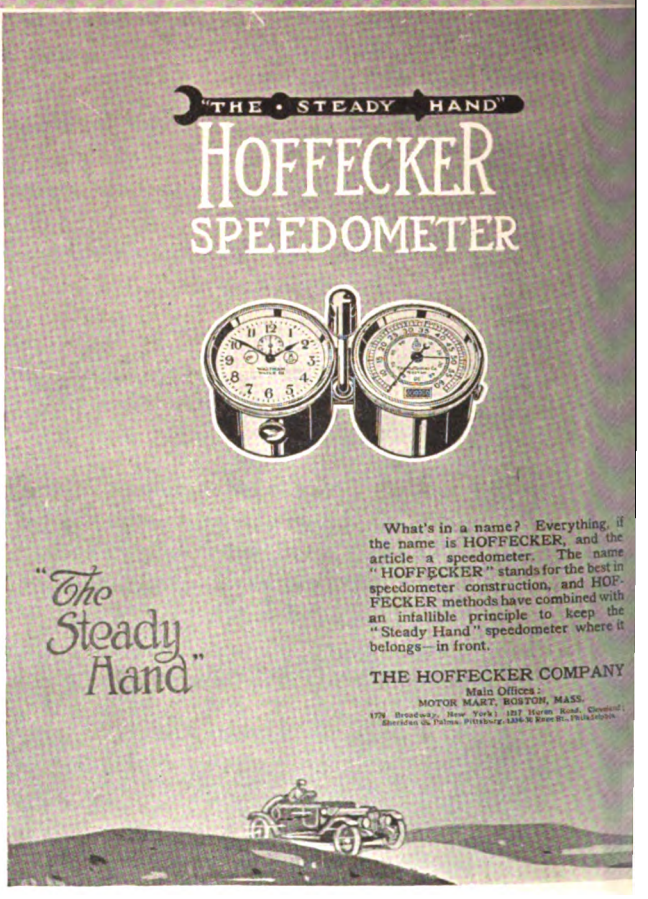
FACT 6. Hyatt Roller Bearings are less liable to Accident or Injury because they carry the same load on a larger surface than ball bearings afford.

FACT 7. Hyatt Rollers Never Crowd or pile up in a bearing, thereby grinding and destroying the entire bearing.

FACT 8. Hyatt Rollers Will Not Crack or split as balls sometimes do when the wheels drop into a rut and the car is heavily loaded, thus causing annoyance, delays and expensive repairs.

FACT 9. Hyatt Roller Bearings reduce excessive and unnecessary Wear because they relieve gears and shafts of undue strains resulting from imperfect alignment.

FACT 10. Hyatt Roller Bearings are made only from carefully Selected Steels which are chemically and physically tested, heat treated and ground.



FACT 11. Hyatt Roller Bearings were used on 91.7 per cent. of all pleasure and commercial cars that were manufactured during the season of 1912.

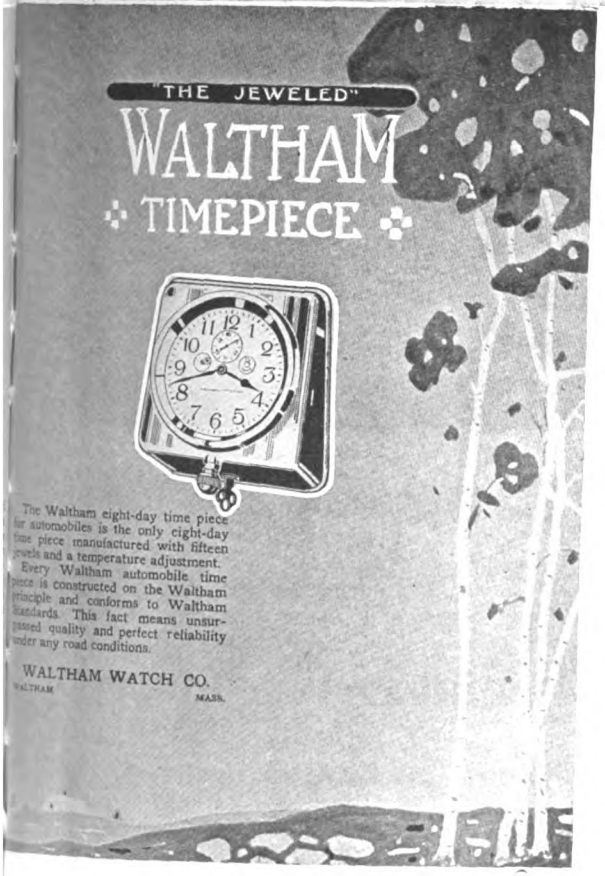
HOFFECKER'S SPEEDOMETERS

THE QUALITY THAT CAR DEALERS-MANUFACTURERS

The name "Hoffecker" on a speedometer and "Waltham" on a timepiece stand sponsor for quality that is standard and of world-wide reputation. Car owners who read and reason before they buy, ***know*** this quality and ***demand*** it.

No enlargement on the prestige of the Hoffecker and Waltham products is necessary here. This has been established through years of consistent service. It is rather the present intent to ***show how*** it is commercially possible to produce these instruments of precision and durability at prices within reason.



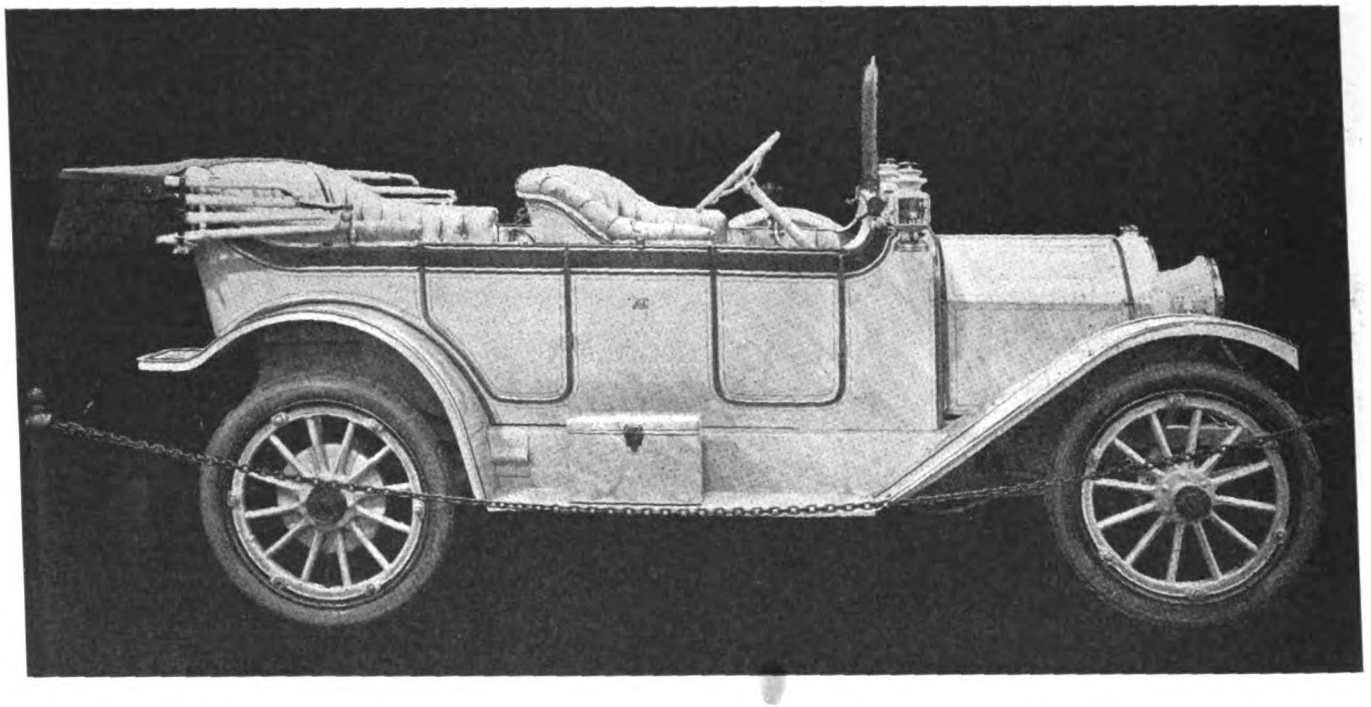
Hoffecker speedometers and Waltham timepieces have never been extravagently exploited. They have never had quality sacrificed to meet tremendous advertising overhead expense. They embody sterling worth in material, fine workmanship and finish, ***made possible only by the money that goes right into the instrument—not into indiscriminate waste publicity.***

Of course, they ***are*** advertised, but

Digitized by Google

COMBINATION OWNERS DEMAND WALTHAM TIME PIECES

READ THE MESSAGE



always on the "bull's eye" basis, and with no "scattering fire" effort. This publicity has value plus—for the car manufacturer, the dealer and ourselves. Read why. The double-page reduced advertisement shown here, is typical of Hoffecker-Waltham advertising, current in ***Motor, The Automobile*** and ***Motor Age***—three papers that practically cover the cream of car owners who, as readers of these publications, are qualified to recommend and buy intelligently. In brief, this group constitutes a buying and selling force in the field. Through reading and observation, they recommend the best to others and demand the best for themselves.

"Hoffecker-Waltham" is a combination that ***your*** trade wants. It is a combination that will make a good car better, lessen resistance and increase your prestige in your community as a dealer who is known as a believer in standard, dependable merchandise. In all probability the cars you sell ***are*** so equipped—if not, then get all the facts from us—you may be able to help your customers to more and better service.

$850 Detroiter $900

A Car of Ivory and Fine Gold

The car that made the big hit at the New York Show. This week it is creating a parallel excitement in Detroit. During the Chicago Show it will be on exhibit at the salesroom of the

Illinois Automobile Company, 1240 Michigan Ave, Chicago

THE cost of making this beautiful car was far above the standard Detroiter price, yet in the essentials of construction it is identical with every other Detroiter that leaves the factory. Money cannot buy better principles than are found in every car of our output. It can only purchase the non-essentials.

$850 Is the Standard Price

Every Detroiter has nine exclusive features that are not combined in any other car short of four times the Detroiter price. It has the platform rear spring, full floating rear axle, ball bearings throughout, long stroke motor and similar features that the experience of car makers has proved best.

Economical in After Cost

The Detroiter—any weather, any roads—averages from 20 to 25 miles on a gallon of fuel, and 100 miles to the quart of lubricant. No car of its enduring construction can match this record. No selling argument is so powerful as this—when gasolene is going up every month.

Dealers:

For the Middle West especially, the Detroiter is this season's leader. When you come to Chicago, come with your mind made up to give the car the thorough inspection it deserves. Remember, it will not be on exhibition at the Show. You will find it at the salesrooms—1240 Michigan Avenue.

If you are not coming to the Show, write for further information.

The J. S. Bretz Company Announce A New F & S Ball Bearing For 1913—Fitted With Their New Blue Ribbon Retainer

"——the good plan itself, this comes not of its own accord; it is the fruit of genius, which means transcendent capacity of taking trouble first of all."

—Carlyle.

F. & S. Bearing Complete

F. & S. Outer Raceway and Balls

F. & S. Inner Raceway

F. & S. Blue Ribbon Retainer

FOR 1913 Messrs. Fichtel & Sachs, of Schweinfurt, Germany, manufacturers of the well-known **F. & S.** radial and thrust ball bearings, have recently added a new type of ball separator to their other types, the most prominent of which, of course, has been the die-cast aluminum separator so well-known in the various arts and industries in which it has been employed. The new separator, a one-piece steel separator, will be known as the "Ribbon" type. This separator is formed from a one-piece, patented, unit sheet steel stamping, drawn and formed without joints, welds or rivets in its construction. The separator itself is heavily corrugated and ribbed on one side for added stiffness, and finished in gunmetal blue; is light in weight and frictionless.

Its use permits of normally grooved raceways of deeper cross-section than any other make. Its correct radius lines thus adding enormously to the lateral wall strength of the inner and outer raceways.

The radius of curvature of the raceway on the inner race is made somewhat smaller than that of the outer race, since looking at both races sideways, the outer race curves in a manner concave to the ball and the inner race convex; the outer race, therefore, encloses more of the ball than does the inner race.

The four illustrations show the construction and also show the complete assembled bearing. There are a whole lot of advantages justly claimed for this new form of construction which has been under test and actual use for over a year, and one of the main features of the bearing with the new separator is that it permits of unlimited high speed and vibration, besides which the retainer cannot be affected by heat.

The new retainer permits the use of larger balls, and in many of the sizes, a larger number of balls, which has always been a predominant feature of **F. & S.** ball bearings of every type on account of their transverse side entrance ball filling slot construction on the inner and outer rings on one side.

The bearings are made in standard ball-bearing sizes, interchangeable with other makes. They do, however, differ from others, in having a higher load carrying capacity and greater endurance, due to the larger number of balls contained in the bearing.

This statement of the quantity of balls used, however, does not hold in all the sizes, since this "Ribbon" type of separator requires the use of an even number of balls, and hence in the design in sizes where an odd number of balls was previously used, it has required a negligible decrease rather than an increase in the number of balls; but as the load capacity of the bearing varies as the square of the ball diameter, and directly with the number of balls, it is obvious that an increase in the diameter of the balls more than compensates for the slight decrease in their number. In many of the sizes, increase in load capacity runs as high as 30 per cent. The "Ribbon" type of separator also permits of a much freer circulation of the lubricant, and lessens the probability of foreign particles being retained in the separator. It is also true that the new type of ball bearing operates even more quietly than does the aluminum type of separator.

A self-aligning type of radial bearing has also been added to the line. This type consists of a standard bearing with a spherical surface on the outer race, and the addition of a washer with a spherical inner surface. This permits of adjustment in case of shaft deflections.

On account of recent large additions to the already great plant, **F. & S.** are now able to produce special bearings to inch dimensions, or other special constructions, without interfering with their standard production. It may be of interest to note that a recent official accountant's tabulation of outputs developed the fact that over 50 per cent. of the ball bearings produced in the German Empire were manufactured by Fichtel & Sachs.

'HIS VALVE

scientifically built to overcome ree common valve troubles

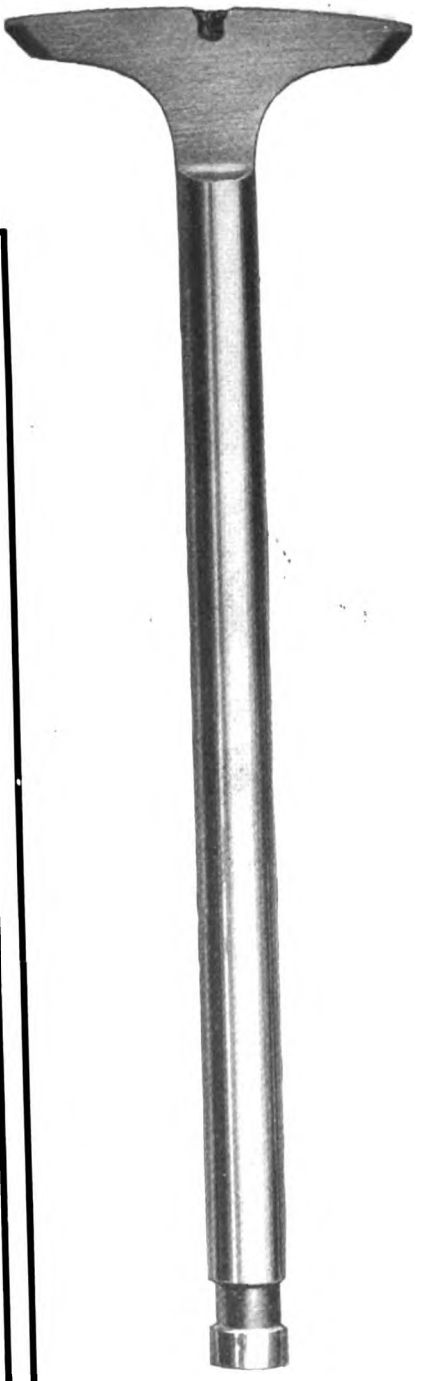
Pitting of the Seat

Cast iron—the best known material for a valve seat—as applied on this valve minimizes pitting. The service life is thus increased 200 to 300 per cent.

Warping of the Head

The properly heat treated steels used in the head of the valve will stand the high temperature of the gas engine cylinder without warping.

Fatigue and Breakage of the Stem



Low carbon steel is used for the stem because experience proves that the hammering action of the cam shaft will not break it.

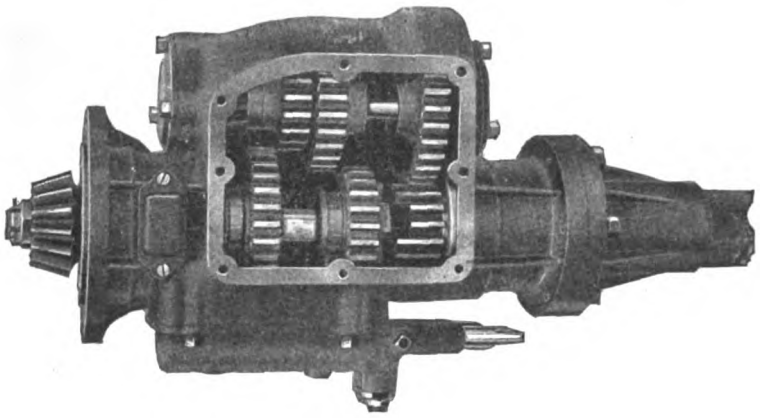
It has required years of experience and experimenting to find the materials best fitted for such valves.

It requires expert knowledge of welding processes to unite them in one solid piece.

Considering these things and the service these valves will render they are the least expensive in the long run. The saving of one regrinding will more than pay for the valves.

The Electric Welding Products Co.
CLEVELAND, OHIO

CROSS SECTION



Cross section of the valve head showing the cast iron seat.

The head is first electrically welded to the stem. The cast iron is then welded to the head by the oxy-acetylene process forming a cast iron alloy around the seat of the valve.

COVERT

Covert Recognized Because Specialized

This year many more leading models show Covert Rear Axle Transmissions and Covert Jackshaft Transmissions, than ever before. There must be merit to warrant this growing popularity.

Fourteen years ago we exhibited the first Rear Axle Transmission. Our confidence in the advantages of this construction, at that time, has been justified by its converts, including many of the leading engineers in this country and abroad. These advantages apply with equal force to the manufacturer, and the man who operates the car.

We maintain a staff of able engineers, who will gladly go over your transmission problems with you.

We specialize on Transmissions designed for direct attachment to rear axle or jackshaft, and practically all the leading manufacturers of those parts carry a complete line especially designed to take Covert Transmissions.

Your 1914 plans are now before you. Let us show you the advantages of Covert construction.

Mr. Car Manufacturer

You can guarantee your car mechanically but you do not protect the purchaser on tires.

A few cents judiciously expended for Gilmer Tire Repair Pliers as regular equipment will save the buyer of your car hundreds of dollars.

All manufacturers of motor cars realize that the real item of up-keep is tires, for it is an acknowledged fact that the best set of pneumatic tires may be cut or bruised in the first hundred miles of service, and injured rubber leads straight to the inevitable blow out. Hundreds of good tires are discarded daily before they have given 50 per cent. service.

The above is an indisputable fact, Mr. Car Manufacturer, and any little effort on your part to eliminate the excessive tire up-keep will be appreciated by the purchaser of your car.

Gilmer Tire Repair Pliers as regular equipment will be a constant reminder of your foresight in supplying him with the proper tools and equipment to prevent premature blow outs. It takes but a few minutes each week to thoroughly heal any little wound, and wherever introduced Gilmer Tire Repair Pliers bring hundreds of endorsements.

Let's get together on your 1913 equipment. A complete Gilmer set with every car you manufacture represents but a few cents extra expenditure per car: may I quote you in quantity?

G. WALKER GILMER, Jr.
52 North Seventh Street Philadelphia, Pa.

GILMER TIRE-REPAIR PLIERS
PATENTED TRADE MARK

BENZ

Since the introduction of BENZ cars to the motoring public of America no car has attained such world-wide supremacy as to its construction, standing up quality, and material. The new type of 35 and 50 H. P. BENZ models are the last word in automobile construction.

The noticeable features of this type of BENZ cars include the offset crank shaft, smokeless oiler, and SILENT CHAINS instead of timing gears.

The BENZ Carrosseries are noted for their beautiful lines and thorough comfort.

To those desiring AGENCY of this car the Benz Company will offer special terms. We want RELIABLE, ENERGETIC agents to further our interests for both BENZ pleasure cars and BENZ-GAGGENAU trucks, which today stand recognized by those who know, as the leading 6-ton truck. Makers of cars exhibiting at the New York Shows had Bosch-Equipped cars on view—14 other makers of ignition divided the balance.

No argument, no proof, no claim is so thoroughly convincing as is the showing of universal selection—the greatest engineers of the industry acknowledge the superiority of Bosch—the extensive adoption of this method of ignition is the zenith of supremacy proof.

BOYCE
MOTOMETER
PAT'S PEND'G

1913's TRADE SENSATION

Know the Exact Heat of Your Motor While Driving

The Motometer is a watchlike instrument fitted to the radiator cap, protecting the motor from damage caused by improper lubrication, overheating, defective cooling, etc. By means of a red fluid indicator it warns you.

When the Radiator Needs Water
When Oil Supply Is Insufficient

In short, it tells whatever excessive heat tells—a broken water pump, a clogged pipe, a broken fan belt, etc., and tells before the damage is done.

Attached the same as an ornament, readily visible from the seat day or night. It will prevent frozen radiators in winter and cracked cylinders in summer.

Finished in black enamel with gold plated or nickel rims.

View from Seat

INTERLOCK INNER TIRES Stop Tire Troubles

The one weak point of the automobile is that you cannot depend on the tires. Thousands of motorists have solved their tire problem by discarding inner shoes, relinors, fillers and other makeshifts and equipping their tires with Interlock Inner Tires.

Interlocks are complete inner tires (not inner shoes) placed between the outer casing and inner tube to strengthen the casing and protect the tube from punctures. They double the mileage of new tires and add 1,000 to 5,000 miles to old casts—save half your tire expense—and make tires trouble proof.

Dealers and Motorists—Investigate Interlocks

Don't delay—write now for booklets, data, prices, testimonials of users, road tests, etc. Mention size and kind of tires you use.

TRIPLEX

A FUEL SAVER and A MONEY SAVER

Increases Power
Decreases Cost

The Triplex is a device placed between the manifold and the carburetor to break up the mixture. No matter how imperfectly the carburetor does its work, the Triplex equalizes the mixture, producing an explosive gas of even, uniform quality that will burn clean to the last atom. This means that the user gets all the power all the time—that every fraction of energy to be obtained from the gasoline is produced and used. There is absolutely no waste. High proof gasoline is made out of low, and over 25% is saved on every gallon. For further information write us.

If You Need Motor Lamps
You Need This Catalog

We want you to write for the Solar Catalog before you decide on your motor lamps, for this is the most complete line of lamps on the market. Solar Lamps have been preferred by most motorists for the past fourteen years because of their brilliancy, their style, their strength and their several exclusive advantages—their special short focus lead glass lens mirror reflectors—the patented double ray light projection (in the Solarclipse), giving two distinct fields of light, for city and country use—the new black finish, the only such finish that's proof against heat and moisture—and other features that other lamps lack.

To fail to see Solars before you buy is to fail to include in your consideration the very finest lamps in existence. Solars are made for oil, electricity, gas and in combination, for pleasure cars, motor trucks, carriages, motor boats and airships. Write for catalog now—while you think of it. (136)

CLEVELAND

We make control levers for most any position on the car, also any style of transmission. Tell us what you need and we will quote.

Repairing Casing

TIRE CUTS ruin casings. They admit moisture to the carcass, cause the fabric to rot and weaken, grow larger—end in blowouts.

You can repair **CASINGS** and **INNER TUBES** anywhere in 15 minutes, better than a Repair Shop can do—and for *one cent.*

Universal Auto-Vulcanizer
Patented

A practical vulcanizing outfit complete, with enough repair gum to make 40 patches. It weighs 3 pounds and can be carried in the tool box. **Simplest and most satisfactory device for eliminating tire troubles that has ever been devised.**

Absolutely automatic. Place the patch—attach the Vulcanizer—put in the gasoline—light it. No further attention required. In 15 minutes the job is done.

It *can't burn, scorch* or *injure* tube or casing. It *can't* get out of order. It *can't* fail to do its work. So simple, anyone can operate it. The Universal Auto-Vulcanizer saves its cost a *hundred times* over in trouble and expense.

Price Complete, **$4.00** Ready for Instant Use
Guaranteed Satisfactory or Money Refunded

Four years ago we recorded a prediction

Four years ago we foretold in our advertisements as reproduced in the appended column, that:—

Ultimately the Cadillac Motor Car would find its way into the hands of hundreds of owners who had theretofore paid twice and thrice as much money.

You must be conscious that the prophecy is being fulfilled; that the "hundreds" predicted is being realized in "thousands."

The prediction was not made in a spirit of vainglory.

Nor is its realization recorded now with any special sense of elation.

But the simple fact is interesting, and highly creditable.

Creditable, we mean, to the discernment of the American business man.

It is not easy to resist the glamor of the highest dollar-mark.

It is not easy to believe that equal or greater excellence can be found at a lower price.

But that is precisely what has happened in the case of the Cadillac.

We felt four years ago that it must happen.

We were sure that no manufacturer could have higher ideals; or adhere more rigidly to those ideals.

The basis of a car's worth, of course, is the engineering practice and the factory practice which govern its construction.

That is the first excellence you strive to obtain when you pay the highest price.

And that was precisely the point in which the Cadillac was awarded world's precedence by the Royal Automobile Club of London.

We knew that in practice—close measurement, standardization, alignment, proportion—the Cadillac was not an aspirant but actually a leader.

We knew, in other words, that it was not surpassed; and that it was not even equalled in that respect.

And we knew, too, that that which went into the car could not be better.

We had no thought of emulating cars of higher price.

We were wholly engrossed in making the Cadillac the best of cars.

So, the fact that our prophecy has come true is an incidental, although an important result.

It has happened because we began with the positive conviction that—given a production of adequate size—no higher price than the price of the Cadillac was necessary for the highest type of motor car.

Surely your own Cadillac experience, the experience of every Cadillac owner in your community—and, indeed, of every Cadillac owner you have ever met anywhere in the world—justifies it.

The Cadillac is now the choice of thousands who were once wedded to cars of the highest price.

They have abandoned the recognition of the dollar-mark as the symbol of highest value.

It is one of the most interesting things that have occurred in motor-car history—one of the most significant signs of enlightenment in buying that has occurred in latter-day America.

The Prediction

Reproduced from Cadillac advertisements of December, 1908

Ultimately the Cadillac will find its way into the hands of hundreds of owners who have heretofore paid twice and thrice as much money.

The deep-rooted conviction which these men naturally cherish—that there must be something lacking in the Cadillac to make such a price possible—is one which the Cadillac Company is eager to encounter wherever it can be found.

To meet and defeat that impression by practical demonstration during the ensuing season is of vastly more importance than the mere matter of sales.

The latter problem has been disposed of by a demand from dealers which has exhausted an output of ten thousand cars; and driven the factory to exert its fullest continuous capacity night and day.

Of infinitely greater moment, as affecting the well-being of the Cadillac Company a year from today, and ten years thereafter, is the establishment of the principle that a high-powered car, of the highest grade, can be built to sell at a popular price.

Stripped to the chassis and subjected to the jealous scrutiny of experts in material and in mechanics; matched part against part, down to the last detail, with cars of known integrity sold at the highest market figure, the Cadillac will prove beyond question that such a car can be built at such a price.

But your investigation, proving that the Cadillac Company has made the impossible possible by heroic means and methods, will likewise demonstrate this, that

HIGH-POWERED CARS EQUAL TO THE WORLD'S BEST CAN BE BUILT TO SELL AT A POPULAR PRICE IN ONLY THE ONE FACTORY WHICH IS FITTED BY EXPERIENCE AND EQUIPMENT TO UNDERTAKE THE TREMENDOUS TASK.

STYLES AND PRICES

Standard Touring Car, five pass			$1975.00
Six passenger car	$2075.00	Roadster, two pass.	$1975.00
Phaeton, four pass.	1975.00	Coupe, four pass.	2500.00
Torpedo, four pass.	1975.00	Limousine, 7 pass.	3250.00

All prices are F. O. B. Detroit, including top, windshield, demountable rims and full equipment.

Cadillac Motor Car Co., Detroit, Mich.

Digitized by Google

KLAXONIZED

These 48 cars are Klaxonized:

A. E. C.	**F. I. A. T.**	**Packard** (Special)
Alco	**Flanders**	**Pope Hartford**
Armleder	**Hudson** (Special)	**Pierce-Arrow**
Autocar	**King**	**Pratt**
Babcock Electric Roadster	**Knickerbocker**	**Schneider** (European)
H. H. Babcock	**Knox**	**Simplex**
Bailey	**Lancia** (European)	**Staver**
Benz	**Lozier**	**Stearns**
Borland Electric	**Marmon**	**Sternberg**
Broc Electric	**Matheson**	**Stevens-Duryea**
Charon (European)	**Metallurgique**	**Stoddard-Dayton**
Chicago Electric	**Multiplex**	**Touraine**
Church-Field Electric	**National**	**Guy Vaughn**
Cole (Special)	**Oakland**	**Walker Electric**
Columbia	**Oldsmobile**	**Ward**
Davis	**Orson**	**White**

IN this list of Klaxonized cars, you will note an *almost* complete line-up of the high-grade automobiles.

What does this mean?

On the face it simply shows that all of these cars go forth today equipped with Klaxons. But back of that it means that these manufacturers are determined to have their cars equipped to the highest degree of safety and comfort; and to that end they provide the best accessories obtainable—the *standard* ones.

Deeper still, it means, that in the opinion—*practically unanimous*—of the car manufacturers of this country and Europe, the bulb horn is neither sufficient nor efficient, and that the *one* dependable, adequate, safe, signal is the *standard* Klaxon.

Studebaker

Seats Six Passengers--Started by Electricity--Lighted by Electricity

The Studebaker "35," for $1,290, is the Biggest Value You Can Offer

A car that has set a high water mark for efficiency, looks, and luxurious appointments.

Compare it with cars that sell for $2,000 or more.

Two passengers in the rear seat, two in folding seats and two in front spells comfort.

A Studebaker "35" sells on sight.

The long rakish body, the sumptuous upholstery and the perfection of detail wins favorable comment.

The electric self starter---which will turn the motor over eighty times a minute for 31 minutes by simply pulling a handle on the steering column---and does it every time---is a strong selling point.

And the high quality, good looking electric lights appeal to the man who wants the last thing in touring comforts.

Then there's the long stroke accessible motor---better than 35 H. P.

The full floating rear axle eliminates any possibility of axle trouble.

Note the extraordinary comfortable springs, semi-elliptic front, three quarters-elliptic rear.

And the complete, up-to-dateness of the equipment.

No other car like it at the price---$1,290.

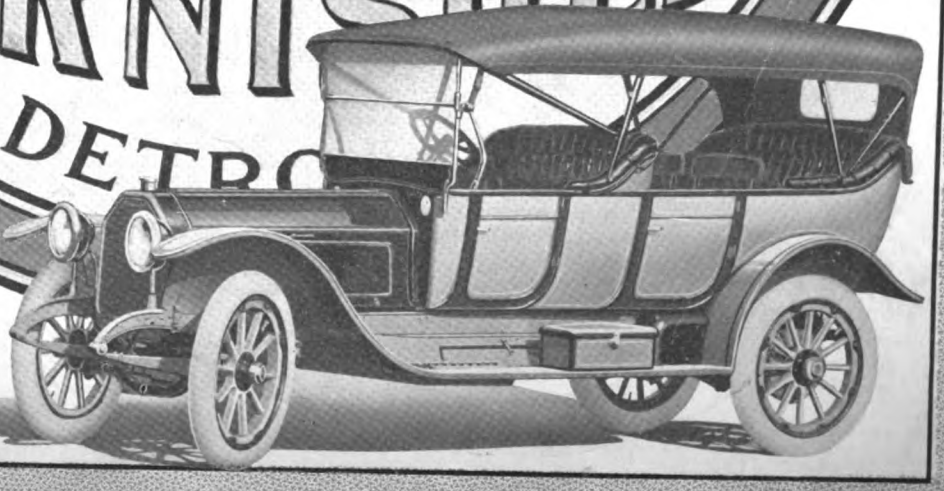
A Trade Paper Giving the World's Motor New

Vol. XXXIV
No. 7



New York, February 6, 1913

Ten cents a copy
Two dollars a year

To a man who KNOWS good varnish, this trademark is sufficient praise for any car that has been finished with Berry Brothers Automobile Varnishes and Baking Enamels.

To any man who is NOT a varnish expert, the results on any car finished with Berry Brothers Automobile Varnishes and Baking Enamels are immediate optical proof that the best materials were used.

BERRY BROTHERS'
CELEBRATED
TRADE MARK
BRILLIANT. DURABLE.
UNEXCELLED
VARNISHES

Every dealer who handles cars finished with Berry Brothers Automobile Varnishes and Baking Enamels has a triple help in making sales — the reputation of Berry Brothers, the favorable first impression of the car, and the durability of that impression.

Helps You Meet Competition

Inclusion of the Truffault-Hartford Shock Absorber in a car's regular equipment enables both manufacturer and dealer to meet competition more successfully.

The manufacturer who equips his car with the Truffault-Hartford offers a bigger value for the money than would be possible without this unique device. This shock absorber adds to the value of any automobile because it makes a car comfortable—reduces up-keep cost—insures safety—helps an owner to get the most out of his car. The

Truffault-Hartford SHOCK ABSORBER

is now so generally recognized as absolutely necessary to a car's proper performance that 23 leading manufacturers include it as factory equipment with every car they turn out and the car YOU sell should be equipped with it.

Sold on a guaranteed-to-give-satisfaction basis, the Truffault-Hartford never fails to stand up to its work. Our generous agency terms will appeal to a progressive dealer. Write us today for details.

Firestone
NON-SKID TIRES

THE confidence felt by Firestone users explains the widespread choice of Firestone Non-Skid Tires;

—Confidence in the secure road-grip of "NON-SKID" sharp edges, abrupt angles and deep, vacuum-creating hollows.

—Confidence in the ability of these tires to take the car safely over rain-soaked asphalt, or through mud or slush;

—Confidence in the builder, who is ***personally*** responsible for every tire—the man with whom quality has been a habit for over twelve years;

Security greater than that of any other tire or mechanical device, without the shortening of tire life and ruining of the road which such devices incur;

Economy of longest tire wear, smallest gasoline consumption; greatest car protection;

Comfort of riding by means of extra thick, unusually resilient tread.

These are the ***extra values*** every Firestone user buys. Specify these Non-Skid Tires for your car.

The Atwater Kent Ignition System

Time was when automobile engineers and the general motoring public thought they must equip their cars with a magneto. Today this idea is fast waning—in fact, it has been discarded by many of the foremost automobile engineers and discriminating motorists who are now demanding a more dependable source of current on their cars.

The increasing use of electric lighting and starting equipment necessitates an ignition system better than the magneto—a system producing a uniformly hot spark at low speeds as well as high—a system giving a hot starting spark with the motor at a standstill—a system that is simple in principle and mechanism as well as in operation, and reasonable in initial and maintenance cost—in brief, a system of ignition that will measure up to the highest requirements of the most modern automobile practice.

Such is the Atwater Kent Ignition System—embodying the best features of both magneto and battery, without the weaknesses of either.

Remember the Atwater Kent System can be easily and quickly installed on any standard make of motor, new or old, without the price of a magneto.

If you have an unsatisfactory magneto, or if your motor is not equipped with a half time shaft, you can use the Atwater Kent System by means of our magneto gear mounting, the cost of which is nominal.

In addition to our standard Type F System, we are marketing a new model —Silent Type K with automatic spark control and insulated primary circuit.

Whether you are interested in motor cars as manufacturer, dealer, owner, or prospective buyer, you should have a copy of our booklet "D." It covers the subject authoritatively and thoroughly and even the most experienced will find it interesting reading.

ZENITH ANSWERS STROMBERG AND FILES COUNTER SUIT

Attacks Ahara and Richards Inventions and Their Purchase—Charges Infringement of Zenith Carburetter Patent.

On Friday, January 31st, the Zenith Carburetter Co. of Detroit, Mich., filed its answer to the suit for infringement of the Ahara and Richards patent brought against it by the Stromberg Motor Devices Co. of Chicago, Ill. The next day, Saturday, February 1st, the Zenith company lodged a countersuit against the Stromberg company, in turn alleging infringement of its patent, No. 907,953, granted to Francois Baverey of Oullins, France, on December 29, 1908.

The Zenith answer is for the most part a general denial of infringement, but among the several specific items it is denied that Stromberg carburetters have been marketed with the word "Patented" stamped thereon; and, further, the Zenith people aver that the Stromberg company only recently purchased the Ahara patent, No. 684,662, of October 15, 1901, and the Richards patent, No. 791,501, of June 6, 1905, "for the sole purpose of harassing these defendants." It is also charged that the Stromberg people "conspired to injure" the Zenith interests by making an infringement of the Zenith carburetter in violation of the patent which is claimed to cover the latter.

The Ahara and Richards inventions are attacked on the grounds of lack of novelty and invention, and the answer cites a long list of prior patents. The earliest is No. 62,856, granted in 1867 to Joshua Kidd, and the second, No. 296,340, dated April 8, 1884, to Hiram S. Maxim; Alexander Winton's patent, No. 582,108, of May 8, 1897, is also among those cited.

In its countersuit against the Stromberg Motor Devices Co., which was filed in the Federal court in Detroit, the Zenith Carburetter Co. alleges that the Baverey patent has been infringed since July 1, 1911, and, of course, asks for an injunction and accounting.

The particular Stromberg carburetter which is claimed to infringe the Zenith patents is the "Model E" Stromberg, the manufacture of which the Zenith people assert was undertaken prior to Stromberg's acquirement of the Ahara and Richards patents, which are claimed to cover all the so-called plain tube carburetters.

Bankruptcy Added to Atlas Troubles.

The Atlas Motor Co., of Springfield, Mass., which was sold under a mortgage foreclosure Saturday, 25th ult., to Charles D. Whitney, manager of the Victor Sporting Goods Co., of the same city, at a time when it was negotiating to be taken into the so-called Orson merger, has become involved in further difficulty through an involuntary petition in bankruptcy which was filed in the Federal court in Boston Wednesday, 5th inst. The petitioners are three small creditors whose claims aggregate $1,147.

St. Paul Tradesmen Seriously Injured.

Frederick L. Buchanan, proprietor of the Motor Truck Co., and E. A. Theim, of the Joerns-Theim Motor Co., of St. Paul, both well known in the northwestern trade circles, were seriously injured on Wednesday, January 29th, when a motor truck which Buchanan was demonstrating to Theim, was struck by a freight train. Buchanan was removed to the Cobb hospital, suffering from a fractured skull and in a critical condition; Theim sustained concussion of the brain but was taken to his home.

Paul Smith to Direct Lozier Sales.

Paul Smith, who until December last was sales manager of the Flanders Motor Co. of Detroit, has been appointed sales manager of the Lozier Motor Co. of that city. He succeeds C. A. Emise, who resigned to become a member of the newly organized Chandler Motor Car Co.

WOULD DISCONTINUE THE NATIONAL SHOWS

Albert L. Pope Inaugurates Movement for That Purpose and Finds Quick Response—Potent Reasons Brought to Bear.

Although he had hoped that it would escape the public prints until the movement had attained definite shape, or had been formally considered, it became generally known this week that Albert L. Pope, president of the Pope Mfg. Co. of Hartford, Conn., has taken the lead in an endeavor to eliminate at least the national shows. He expressed his views in a communication, bearing date January 25th, which was addressed to all automobile manufacturers of moment.

In reply to a Motor World inquiry, Pope yesterday stated that of the responses received at least 90 per cent. are favorable to the discontinuance of the shows.

"I think it is about time we came to our senses," emphatically remarked Pope in discussing the subject.

When asked if free-lance promoters are not likely to take up the work immediately the automobile organizations lay it down, and if manufacturers are not likely to emulate sheep in responding to the promoters' wiles, Pope declared that he has no fears on that score if the remedy he has in view is adopted. He prophesied it would be effective, but at this time declined absolutely to say what it is. He added that the matter probably will be discussed at the March meeting of the executive committee of the National Association of Automobile Manufacturers, and until that time he deems it unwise to discuss the plans which he has in mind.

He admitted, however, that Col. George Pope, for many years chairman of the Board of Trade's show committee, and who also is treasurer of the Pope Mfg. Co., shares his

Digitized by Google

opinion that shows have outlived their usefulness and have become an evil which seriously impairs business and disorganizes the affairs of each respective manufacturer.

Exactly how Mr. Pope feels on the subject is expressed in his communication broaching the subject which he addressed to the various car manufacturers. It is as follows:

"I have been giving the matter of automobile shows in general a great deal of consideration lately and have thought it over from every standpoint and wondered in my own mind how long this industry of ours could stand such expense as automobile shows in general entail.

"The past week I have been more impressed than ever at the Madison Square Garden show as to the matter of expense, for the automobile industry in general pays for it. Last year I understand gate receipts paid by the public at Madison Square Garden were only 40 per cent. of the total. It is too early at this writing to say what they will be this year, but in all probability they will be somewhat less. The trade in general paying for and giving away the tickets not only pays the rent and decorations, but a large part of the patronage as well.

"The disorganization of your factory and sales department and business in general during the weeks of the show is a serious matter and I think one that will have to be reckoned with in the near future by the automobile industry. The money in addition that is left with the hotels in New York and other cities is another serious point.

"Now, the situation resolves itself right down to this: Can the automobile industry stand the expense of these shows with all its ramifications?

"As soon as the automobile show is in progress of promotion it is merely a signal for all newspapers and publications of every kind to attempt to get from the automobile manufacturers advertising, and this year it seems to me that it has been worse than ever.

"Several prominent men in other lines of business have commented to me in the last week as to the expense of the automobile show and have not hesitated to make the statement that the business they were in could not stand any such expense. I think we are beginning to be seriously criticized by the public, and I feel that it is a question that ought to be discussed thoroughly from all points of view and if for no other reason it should be deemed wise by a majority to discontinue shows, this is the time to take the matter up, because in the very near future the association will be making leases and arrangements for shows in 1914.

"If you feel as I do, that shows should be discontinued, or at least the matter thoroughly discussed by the manufacturers, will you kindly write a letter to the National Association of Automobile Manufacturers, 7 East 42d street, New York, requesting them to call a meeting of their members for a discussion of this matter in the very near future, so that if it is determined that shows be discontinued during 1914 we may be in a position to notify all those who are now interested to discontinue their preparations so far as we are concerned as manufacturers?"

Cleveland Has a $360,000 Fire.

Damage to the extent of about $360,000 was done in Cleveland, Ohio, Friday night, 31st ult., when a four-story brick building occupied by the Judd Automobile Co. and other companies was destroyed and about 300 cars, most of them the property of private owners, were ruined; the blaze started in the Judd establishment, at 1204 Huron road, and 275 of the 300 cars burned were in this company's section of the building. The Judd company, besides operating a garage, is the Inter-State dealer. The Buick Sales Co. sustained a loss of $25,000, and damage to the amount of $25,000 was done to the property of the Weaver-Twelvetree Co., dealer in Pierce-Arrow, Premier and Flanders cars, which was located at 1216 Huron road. The losses of the Standard Auto Top & Repair Co. and the City Auto Tire Repair Co. were small.

Morgan Files Suit for Priming Device.

Bernard Morgan, "a subject of the King of Great Britain," as he describes himself in his bill of complaint, filed suit Saturday, 1st inst., in the United States District Court for the Southern District of New York against the Auto Supply Co., of 1789 Broadway, New York City, charging infringement of patent No. 982,009, granted January 17, 1911, and which covers a priming cock for internal combustion motors. Morgan, who operates a garage and machine shop in Newport, R. I., in which in a small way he has produced several specialties, found his way into print not long ago when he sent word to his British brethren that he could find employment in America for quite a number of them and suggested how they might dodge the contract labor law.

Establishes Right to Name "Gordon."

If any doubt existed as to the exclusive right of the Vehicle Apron & Hood Co., of Columbus, Ohio, to the name "Gordon" as applied to tire covers, tire trunks and other accessories of that class, it should be removed by the decision of the United States District Court for the Southern District of New York, which last week enjoined the National Auto Supply Co., of New York City, from falsely representing itself as a purveyor of "Gordon" goods and from substituting other goods for "Gordon" goods after soliciting order under the disputed trade name. The complaint stated that the defendant had listed "Gordon" goods in its catalogue and that when orders were sent in substitutes were sent, even though the invoices read "Gordon." The Columbus company stated that because of substitution its business in 1911 fell off $50,000, despite the fact that its advertising was more than tripled.

Legal Punctures in Patented Tube.

Ira F. Trautman, who about two years ago set up in business in Brooklyn, N. Y., at 129 Sixth avenue, and undertook to produce an inner tube of sponge-like character, under a patent he had secured, appears not to have prospered greatly, according to judgments filed against him this week in the New York county clerk's office; for crude rubber which he purchased from A. W. Brunn, a rubber broker, the latter filed judgment for $499.02 against Trautman and the Trautman Air Rubber Tube Co. Another judgment was for $267.65 and was taken by J. C. Tomlinson, Jr., a New York attorney.

Foundryman and Randerson Settle Dispute.

Differences which arose over a contract wherein William J. Cunningham, operator of a brass foundry in New York City, agreed to manufacture a quantity of bumpers for the Randerson Auto Parts Co., of New York City, and which differences led to a suit by Cunningham in the New York City Court, have been settled and the action has been discontinued. Cunningham sued for about $300 when the Randerson company repudiated his contract on the grounds that the work he did was not up to the specified standard.

Syracuse Dealer Arrested on Judgment.

Frank P. Anderson, an automobile dealer in Syracuse, N. Y., is working in a limited territory, not because of any clause in his agency contract, but because Miss Mary H. Walsh, who claimed she paid money for a car she did not get, secured a judgment for $1,546 and a body execution which brought about Anderson's arrest; incarceration would have been his lot had he not been able to secure a bondsman, but as it is he is forbidden to leave Onondaga county until the judgment is satisfied.

Sale of Michigan Magneto Nets $4,600.

The property of the Michigan Magneto Co. of Detroit, which failed three weeks ago with liabilities of $31,050, was sold by the receiver on Thursday last to Louis Duskoff for $4,600. Subsequently a creditors' dividend of 7 per cent. was declared.

PERMANENT ACCESSORY SHOW A METROPOLITAN VENTURE

Ambitious Venture Scheduled To Be Inaugurated March 1 in Broadway Building—The Projectors and Their Plans.

Just as automobile manufacturers are taking the first steps toward the discontinuance of the national shows, other interests are about to inaugurate in New York City what is designed to be a permanent exhibition, not of automobiles but of automobile wares—that is, accessories of every nature.

These interests will operate under the style Auto Center, Inc., the necessary charter, which places the capital stock at $25,000, having been applied for. The chief officers of the borning corporation are not, however, in any way affiliated with the automobile industry. They are William A. Kelsey, of Meriden, Conn., who is president of both the Kelsey Printing Press Co. and the Morning Record Co., who will be president of the Auto Center, and John Stanley, cashier of the First National Bank in Whitestone, L. I., who will be treasurer.

The man chiefly responsible for the project, however, is John M. Gorham, a New York attorney, who at one time was connected with an automobile renting enterprise. He vigorously resents being styled a promoter, declaring that he is an organizer, and now that his work has been brought to a head he states that he does not know whether he will be connected with it, or, if so, in what capacity.

He is authority for the assertion that the permanent exhibition, or motor mart, or whatever it may be styled, will open for business on March 1st next in the Long Acre building on the northeast corner of Broadway and 42d street, New York City, the entire second floor of which, containing 10,200 square feet, has been acquired for the purpose, the owners of the building apparently being identified with the Auto Center, but to what extent and in what manner Gorham refuses to say. He did say, however, that not less than 45 accessory manufacturers have contracted to display their wares, and as they are given the privilege of sub-leasing a part of their spaces, from information at his command, he estimates that at least 110 different exhibits will be in place when the Center opens for business on March 1st. He will give no names at this time, but says they will be made public next week, when the charter is received from Albany.

According to the prospectus of the Auto Center, a standard booth or counter, six feet square, will cost $75 per month, payable in advance, under lease for from one to five years; or, if desired, any article will be displayed in a booth for $300 per year plus 6 per cent. of the amount of the gross sales, the Auto Center furnishing the salesman and providing the necessary fixtures, etc.

The Auto Center binds itself to expend at least $100 a week for advertising and to provide a changing electric device in a large window and to keep it illuminated until 11 P. M. six nights of each week. Window displays also will be made on an elaborate scale and will be changed regularly.

Portage-Stein Lawsuit Refiled.

The decision of the Court of Appeals of New York State last week that the New York City Court has jurisdiction only in litigation where amounts not greater than $2,000 are involved, has necessitated the withdrawal of several suits from that court and their filing in the Supreme Court for New York county; one which was so handled this week was an action instituted several months ago by the Portage Rubber Co., of Akron, Ohio, against the Stein Tire & Rubber Co., of New York City, on a note for $4,376.33, which amount is more than twice the City Court limit.

Packers and Customer Come to Terms.

The suit which was brought last week in the Supreme Court for New York county by the Colonial Mantel & Refrigerator Co., of New York City, against the Packers Motor Truck Co., of Wheeling, W. Va., proved of short duration, for it was discontinued Saturday, 1st inst. The Colonial company asked $3,043, which it claimed it paid for a Packers truck that was not up to the specifications in the contract of sale and as a preliminary move in the action secured an attachment.

Borrowed Money from the Coal Man.

Money which H. L. Herbert & Co., a metropolitan coal dealer, loaned to the Couple Gear Co., of New York, in 1910 was the cause of a verdict given this week in the New York City Court in favor of the former for $1,777.16; the money was secured by a note of the face value of $1,580, and one cause of dispute over payment was as to whether the endorser, who was John Hanson Kennard, president of the Couple Gear, had been properly notified.

Hay Hangs Out His Own Shingle.

Thomas J. Hay, one of the real veterans of the industry, who for many years was manager of the Ford branch in Chicago, has embarked in business on his own account at 1725 Michigan avenue, in that city. He will handle the Staver line in northern Illinois, eastern Iowa, southern Michigan and all of Indiana.

DAIMLER REVOKES RIGHTS OF ITS AMERICAN LICENSEE

Failure to Pay Royalties Immediate Cause of Action But Friction Preceded It—Mercedes Situation Somewhat Involved.

Strained relations between the Daimler Motoren Gesellschaft, of Untertuerkheim, Germany, and its American licensee, the Daimler Mfg. Co., of New York, which became plainly visible some two months ago, have led to an open rupture. As a result, the Daimler Mfg. Co.'s contract has been cancelled and its rights revoked The Daimler Import Co., of New York, which held the right to import completed cars, also may find itself involved in the litigation.

The fact that friction existed between the German company and its American representatives became public property two months ago, when the former secured an injunction restraining the Daimler Mfg. Co. from interfering with Mercedes owners; the interference consisted of serving notice on the owners of all such cars which had been purchased abroad that they must "step up to the captain's office" and pay license fees to the holders of the Daimler rights in America.

The immediate cause of the cancellation of the Daimler Mfg. Co., contract, however, was its failure to pay $5,000 on the last day of 1912, that sum being the semi-annual payment required under the agreement which calls for a minimum of $10,000 a year in royalties. Several days after being notified that its American rights had been revoked, the American Daimler interests tendered a check for $5,000, but when the legal representatives of the parent company cabled to Germany concerning the acceptance of the money the answer that came back was not of the sort that pleased the Americans or that promoted good feeling between the one-time friends. The tardily tendered money was not accepted, but that the Daimler Mfg. Co. proposes to put up a fight of some sort is indicated by its announcement, the substance of which is that it believes it still "retains its rights" and will act accordingly.

The contract between the two parties was renewed in 1910 and was to be continued for a period of 10 years. The Daimler Mfg. Co. held the Mercedes rights in this country for very many years, but at no time did it cut a very large figure in business, and since the destruction of its plant by fire, about four years ago, it has ceased to operate as a manufacturing establishment.

The cancellation of the contract automatically cancels the sub-agreement entered

Digitized by Google

into by the Daimler Mfg. Co. with the General Vehicle Co. of Long Island City, N. Y., which granted to the latter the right to build Mercedes trucks in this country, but as the relations between the General Vehicle Co. and the German Daimler interests are close and cordial, it is quite probable that the former will become possessed of an even broader license from Germany.

The Daimler Import Co., as stated, retains its license, but has been in the hands of receivers for several months, which implies lask of financial strength, which fact is not very pleasing to the Germans, and it is therefore certain that a change of some sort is contemplated. It is possible that the change may permit the Daimler Import Co. to retain its contract, which was executed in 1910 and covers a term of five years, but it is probable that if such an arrangement is effected new conditions will be imposed.

The Import company also appeared in the current records of the United States District Court for the Southern District of New York this week, when an old suit against it by Leonard H. Dyer, patentee of automobile and transmission devices, was discontinued; this move, however, was "without prejudice," which means that the action may be renewed at any time. The discontinuance is said to have been prompted by the fact that while Dyer held the patents when the suit was started four or five years ago, they are now held by the Enterprize Automobile Co., and if any new action is begun the latter will bring it.

To Make Prof. Bailey's Electric Systems.

For the purpose of manufacturing an electric lighting, starting and ignition system invented by B. F. Bailey, an instructor in electricity in the University of Michigan and the author of several electrical works, the Bailey Electric Co., of Grand Rapids, has been incorporated under the laws of Michigan with a nominal capital of $25,000. Its officers are: President, H. B. Woodcock; vice-president, A. R. Cosgrove; treasurer, R. G. Woodcock; secretary, H. D. Wilson; designer and consulting engineer, B. F. Bailey.

It will manufacture the three-in-one system in one or in separate units, the complete outfit, not including the battery, weighing but 55 pounds. The company also will produce the Bailey small lighting dynamo, which weighs only 15 pounds and which can be applied to any car.

The several productions will be marketed by Wilson & Cosgrove, who are located in the Goldberg building in Detroit.

The Republic Rubber Co. of Youngstown, O., has established a branch in St. Louis at 2018-20 Locust street. It is in charge of George M. Hoffman.

J. D. MAXWELL INCORPORATES SECOND MAXWELL COMPANY

Makes His Challenge to United States Motor Reorganizers Even More Direct—Meanwhile Pays Visit to Indiana.

J. D. Maxwell, who two weeks ago organized the J. D. Maxwell Motor Corporation under the laws of New York and thereby challenged the right of the reorganizers of the United States Motor Co. to use the name Maxwell Motor Co., is not yet ready to disclose his plans. It transpires, however, that in addition to the J. D. Maxwell Motor Corporation he also has organized, under the laws of New York, the Maxwell Motor Co., Inc., which is an even more direct challenge to the United States Motor reorganizers. One of Mr. Maxwell's enterprises will be a car manufacturing company; the other a selling company, but just who are the men associated with him has not been disclosed.

It is known, however, that the lawyer who is directing his legal steps is none other than Herbert L. Satterlee, who is J. Pierpont Morgan's son-in-law and who, oddly enough, was one of the attorneys, if not the chief one, who originally assisted in whipping the United States Motor Co. itself into corporate shape.

Maxwell himself still retains his home in Tarrytown, N. Y., where the original Maxwell-Briscoe factory, now abandoned, is located, but at present he is in Indiana, in either Indianapolis or Newcastle. It is in Newcastle that a branch Maxwell-Briscoe plant is located and of which, although included in their purchase, the United States Motor reorganizers have not been permitted to take possession, having been checked by a restraining order sued out by Indiana creditors.

Changes Among Prominent Tradesmen.

J. F. Lanier has been appointed manager of the Buffalo branch of the Diamond Rubber Co. He succeeds W. Connell Shank.

Frank G. Manthe has been promoted to the management of the Newark (N. J.) branch of the Goodyear Tire & Rubber Co. Previously he was chief clerk of the establishment.

Wm. H. Davis, former advertising manager of the Dayton Motor Car Co., has been added to the staff of the Locomobile Co. of America. He will have charge of its truck advertising.

George J. Bates has been appointed sales manager of the pneumatic tire department of the Firestone Tire & Rubber Co. of Akron, Ohio. For the five previous years, Bates was a department manager in the Diamond Rubber Co.

Henry C. Bailey, at one time superintendent of the Corbin Motor Vehicle Corporation, has been appointed manager of the Hartford Auto Parts Co. of Hartford, Conn. He succeeds David F. Kalish, who resigned to engage in a different line of manufacture.

George H. Connor, assistant sales manager of the Buick branch in Boston for the past five years, has resigned that post to become manager of the Brooklyn (N. Y.) Republic Motor Co., which means that hereafter he will have to do with Chevrolet and Little cars.

C. E. Harding, who for the past 11 years covered the northern part of Ohio and Pennsylvania in the interests of the Goodrich Tire & Rubber Co., has resigned his position and gone over to the Kelly-Springfield Tire Co. He will cover his old territory for the Kelly-Springfield people.

M. L. Railsbach has resigned the sales management of the Jackson-Church-Wilcox Co. of Saginaw, Mich., maker of the Jacox steering gear. He will join Merrill M. Wilcox, former general manager of the company, in a new corporation which the latter is organizing in Saginaw and which it is understood also will manufacture steering gears, among other things.

Castle Finds Another Lamp Account.

Fred E. Castle, former president of the Castle Lamp Co., of Battle Creek, Mich., has joined hands with Charles Munson, sales agent for the Edmunds & Jones Mfg. Co., of Detroit, and together they will constitute the firm Castle & Munson and will continue the E. & J. lamps as the chief account. Rands windshields and several other well-known accessories will be added to their lines.

Keck to Leave New York for Kenosha.

L. J. Keck, who almost since its inception has managed the Badger Brass Mfg. Co.'s Eastern factory in New York, is preparing to return to the main plant in Kenosha, Wis., from which he originally came. He had expected to make the change on February 1st. When he goes to Kenosha, Keck will assume charge of the office affairs of the Badger company.

Firestone "Opens Up" in Salt Lake.

The Firestone Tire & Rubber Co. has taken over the Utah Tire & Rubber Co. in Salt Lake City, which previously handled Firestone tires, and will conduct the business as a factory branch. It will be in charge of M. L. Tarbush, who previously was connected with the Firestone factory in Akron.

The Week's Incorporations

St. Louis, Mo.—Collier-Reitz Motor Car Co., under Missouri laws; authorized capital, $5,000; to deal in motor cars.

St. Louis, Mo.—Patterson-Abram Automobile Co., under Missouri laws; authorized capital, $2,000; to deal in motor cars.

Salt Lake City, Utah—Alkire-Smith Automobile Co., under Utah laws; authorized capital, $25,000; to deal in motor cars.

Fitchburg, Mass.—Welsh & Suthergreen Co., under Massachusetts laws; authorized capital, $30,000; to deal in motor vehicles.

Somerville, Mass.—Atlantic Motor & Supply Co., under Massachusetts laws; authorized capital, $25,000; to deal in motor cars.

Richfield Springs, N. Y.—Ostrander & Owen Co., under New York laws; authorized capital, $8,000; to deal in motor vehicles.

Rosslyn, Va.—District Automobile Service Co., under Virginia laws; authorized capital, $50,000; to operate a motor delivery.

Connersville, Ind.—Central Car Co., under Indiana laws; authorized capital, $100,000; to manufacture motor cars. Corporators—John W. Burke and others.

El Paso, Tex.—Lowell Auto Truck Sales Co., under Texas laws; authorized capital, $10,000; to deal in motor trucks. Corporators—J. J. Longwell and others.

Los Angeles, Cal.—Renton Motor Car Co., under California laws; authorized capital, $100,000; to deal in motor cars. Corporators—P. A. Renton and others.

Camden, N. J.—United States Tire Filler Co., under New Jersey laws; authorized capital, $25,000; to manufacture tire filler. Corporators—R. B. Patton and others.

Philadelphia, Pa.—Tension Tire Co., under Delaware laws; authorized capital, $100,000; to manufacture motor car tires. Corporators—Robert G. Grigg and others.

Toledo, O.—Shriver Rubber Co., under Ohio laws; authorized capital, $50,000; to manufacture rubber goods. Corporators—L. H. Shriver, A. G. Florian, E. A. Florian.

Cleveland, Ohio—C. H. Tyler Motor Co., under Ohio laws; authorized capital, $10,000; to deal in motor cars. Corporators—G. H. Tyler, John Monson, Charles W. Rush.

San Francisco, Cal.—Circle City Garage Co., under California laws; authorized capital, $10,000; to operate a garage. Corporators—R. E. McCrea, W. J. Fink and others.

Seattle, Wash.—Pacific General Motors Co., under Washington laws; authorized capital, $10,000; to deal in motor cars. Corporators—O. L. Taylor, J. C. Burlock and others.

Toledo, Ohio—General Motor Truck Co., under Ohio laws; authorized capital, $50,000; to operate a motor transfer. Corporators—C. B. Grandy, C. O. Morton, F. M. Dotson.

Alliance, Ohio—Alliance Motor Car Co., under Ohio laws; authorized capital, $50,000; to deal in motor cars. Corporators—C. C. Mummert, Morris W. Geiger, G. K. Pritchard.

New Haven, Conn.—National Garage Co., under Connecticut laws; authorized capital, $50,000; to operate a garage. Corporators—Charles W. Lowe, Gennara De Lucia, C. W. White.

Camden, N. J.—Eclipse Wheel Co., under New Jersey laws; authorized capital, $300,000; to manufacture wheels. Corporators—F. R. Hansell, John A. MacPeak, George H. B. Martin.

Baltimore, Md.—Hall-Seeley Motor Corp., under Delaware laws; authorized capital, $1,000,000; to manufacture motor cars. Corporators—Milan W. Hall, C. Ford Seeley, Leo S. Meyer.

Buffalo, N. Y.—Rub-On Mfg. Co., under New York laws; authorized capital, $5,000; to manufacture motor car devices. Corporators—Otis Bower, W. Alek Faxon, Wm. H. Faxon.

Cleveland, O.—Krankless Starter & Mfg. Co., under Ohio laws; authorized capital, $25,000; to manufacture motor car parts. Corporators—A. G. Freeman, F. A. Sweet, Fred E. Gerber.

Boston, Mass.—Universal Truck Co., of New England, under Massachusetts laws; authorized capital, $25,000; to deal in motor trucks. Corporators—M. Meyers, M. E. Crable, F. L. Hewitt.

East Orange, N. J.—F. C. D. Inner Tube Protector Co., under New Jersey laws; authorized capital, $150,000; to manufacture tire protectors. Corporators—G. S. Field, J. H. Christian, T. Dick.

Boston, Mass.—Goodnow Mfg. Co., under Massachusetts laws; authorized capital, $25,000; to deal in motor car supplies. Corporators—Russell J. Goodnow, Walter A. Ladd, Archibold MacGregor.

Hartford, Conn.—Electric Auto Station, Inc., under Connecticut laws; authorized capital, $35,000; to operate a garage. Corporators—Fred W. Woolley, Charles G. Frisbie, Edward T. Canfield.

Peru, Ind.—Peru Castings & Machinery Co., under Indiana laws; authorized capital, $25,000; to manufacture motor parts. Corporators—Claude E. McCampbell, Robert M. Carter, Isaac H. Barbee.

Anderson, Ind.—Clark-Moody Automobile Co., under Indiana laws; authorized capital, $10,000; to deal in motor cars. Corporators—John D. Clark, Louis W. Moody, Maud B. Clark, Anna M. Moody.

New York, N. Y.—United Garage Co., Inc., under New York laws; authorized capital, $14,000; to operate a garage. Corporators—Knud Mynter, Edwin B. Smith, Samuel Ecker, 169 East 19th street.

Detroit, Mich.—City Auto Rental Co., under Michigan laws; authorized capital, $2,000; to conduct an automobile livery. Corporators—Minnie Tucker, Edgar Guard, William Guard, Henry W. Tucker.

Indianapolis, Ind.—Simplex Vehicle & Gear Co., under Indiana laws; authorized capital, $15,000; to manufacture motor car parts. Corporators—Theodore Sanstrom, Maurice M. Kiefer, Samuel S. Helms.

Yonkers, N. Y.—Ralph W. Hibbard, Inc., under New York laws; authorized capital, $5,000; to operate a garage. Corporators—Ralph B. Hibbard, Louise P. Hibbard, Elliott W. Pitkin, 95 Locust Hill avenue, Yonkers.

New York, N. Y.—Brown Car Corp., under New York laws; authorized capital, $30,000; to deal in motor cars. Corporators—W. P. Farge, 56 Park avenue; H. W. Torney, 65 Park avenue; E. E. Beyer, 454 Riverside Drive.

New York, N. Y.—Safety Auto Control Corp., under New York laws; authorized capital, $7,000; to manufacture motor car devices. Corporators—Howard K. Wood, H. O. Coughlan, Joseph F. Curtain, all of 34 Nassau street.

New York, N. Y.—United Garage Co., under New York laws; authorized capital,

LOZIER EX-LIEUTENANTS LAUNCH THE CHANDLER SIX

Form $425,000 Company Under Ohio Laws and Promptly Uncover Their Car—Proves an Appealing Model at $1,785.

Having officially severed their relations with the Lozier Motor Co., of Detroit, with which they were so long connected, F. C. Chandler, C. A. Emise, Samuel Regar and the others who have joined with them have lost no time in putting into practice the well-laid plans which it was known they quietly had worked out.

They have organized the Chandler Motor Car Co., and incorporated it under the laws of Ohio with an authorized capital of $425,000. Temporarily the new company will be located at 925 Woodward avenue, in Detroit, but it is probable that it permanently will establish itself in Cleveland. It is certain, at any rate, that it will not become a Detroit industry.

It will manufacture a light "six" listing at $1,785, fully equipped, the first of which already is in being, but deliveries will not be made until July 1st next.

F. C. Chandler, who previously was vice-president and general manager of the Lozier company, is president of the company which bears his name; C. A. Emise, the former Lozier sales manager, is vice-president and sales manager of the Chandler corporation; Samuel Regar will be its treasurer, a position which he filled in the Lozier institution; W. S. M. Mead, former manager of the Lozier branch in New York, is secretary. J. V. Whitbeck, at one time Lozier's assistant chief engineer, who also has had experience in the Olds, Thomas and Franklin establishments, is chief engineer of the new enterprise, and J. R. Hall, who was superintendent of the Lozier service department, is the Chandler company's superintendent and manager of production. All of the men were identified with the Lozier interests for periods ranging from eight to fourteen years, which implies that they not only know the automobile business intimately but know each other well.

The Chandler light "six," as the new car will be styled, is Whitbeck's creation and all who have been permitted to see it have been impressed by its simplicity and clean design. It does not lack individuality, although in general appearance it closely resembles the Lozier light "six." It has the same stream-line body, the same square tube type of radiator, and also employs ft side drive and center control. It has a heelbase of 120 inches, 34 x 4 wheels fitted ith demountable rims, a three-speed selective transmission of special design and of unit construction, multiple disk clutch, 14-inch double expanding and fully enclosed brakes, floating rear axle, three-quarter elliptic rear springs and pressure fed gasolene supply contained in a tank suspended from the rear frame.

The Chandler motor is one of the car's most impressive features. It is of the L-head, pair-cast type and of remarkably clean design, no oil pipes, for instance, being visible. Its cylinder dimensions are 3⅜ x 5 inches, and at 1,000 revolutions it develops 35 horsepower. The cam shaft, pump and magneto are driven by enclosed silent chains instead of gears. The valves also are enclosed.

The motor weighs approximately 637 pounds and the car, all on, scales slightly less than 3,000 pounds. It employs Bosch high tension ignition and a Westinghouse electric starting and lighting system. The equipment includes mohair top and top covers, quick detachable curtains, built-in windsheld, speedometer, clock, electric horn, rear tire carrier and jack, pump and tool equipment.

In explaining the remarkably low price of a car of such caliber, Sales Manager Emise states that it was made possible solely because there was absolutely nothing to charge to the account of experimental work; the men knew what they wanted and went straight to it without incurring heavy preliminary expense.

Incidentally, it is not the purpose of the Chandler company to make large physical investment in machinery and buildings. The engine and other parts will be built by specialists in the several fields, but according to specifications and under the supervision of Chandler experts. For the Chandler "six" will be a specially designed and specially built car and not merely an assembled machine.

Briscoe Car to be Built in Detroit.

To facilitate the development of his under $1,000 touring car for the American market, which development is being performed in France, Benjamin Briscoe, former president of the United States Motor Co., has registered a company under the title Briscoe Freres, which indicates that his brother Frank, who preceded him abroad, is also interested in the enterprise.

The factory in which the work is being performed, and in which American and French engineers are collaborating, is located in Billancourt, where the Renault factory is situated. It is extremely probable that when the Briscoe model is brought to this country it will be manufactured in Detroit, in which city Benjamin Briscoe first made his mark and to which it is his intention to return.

FIREBALL REKINDLES SPARK IN PREST-O-LITE'S PATENT

Highest Court Permits St. Louis Company to Make Final Test of "Dead" Invention—Will Settle Conflicting Decisions.

Instead of being officially "dead," as was supposed when the United States Circuit Court of Appeals in Chicago so ruled a month ago, the Claude and Hess patent, No. 664,383, under which the Prest-O-Lite Co. operated, is technically possessed of a faint spark of life in that it is to be the subject of further litigation, this time in the United States Supreme Court. The spark was found by the Fireball Gas Tank & Illuminating Co., of St. Louis, which this week was granted permission to appeal from an earlier circuit court decision which held the Claude and Hess patent good. While the outcome is a mere matter of speculation, the Prest-O-Lite Co. is sounding no trumpets of triumph at the prospective appeal, for it had acquiesced to the decision overturning the patent and was preparing to meet competition on other grounds.

The granting of a writ of certiorari is regarded as an indication of a belief on the part of the Supreme Court that the question as to whether the patent expired two years ago at the same time the British patent expired as an important one, and the permission to appeal also is doubtless given in order that one or the other of the two conflicting decisions of the circuit court may be made final. As the matter now stands, a Federal circuit court in Missouri is on record as declaring the patent in force until 1917, while the Chicago circuit court says it died a natural death two years ago, and the latter decision had been generally accepted.

While the Chicago decision was a victory for the Searchlight Gas Co., that strong competitor of the Prest-O-Lite lost its formidableness a few days after its victory, when it went into the hands of a receiver; a complication, also, is that while the Searchlight is permitted to operate under the patent, if able, the Fireball is still under an injunction. The turn which affairs have taken in the highest trtibunal may continue to hold together the Prest-O-Lite and Commercial Acetylene companies, the latter having been the possessor of the patent and the former a licensee, and, with the patent operative, both were complainants in litigation.

The Little Motor Car Co. of Flint, Mich., has established a branch in London. It is located at 89 Great Portland street, West.

In the RETAIL WORLD

E. W. Harrold has entered the garage trade in Lathrobe, Pa.

Avery & Hurley Co., is the style of a new garage business in St. Cloud, Minn.

Scott & Berkler of Emmetsburg, Ia., have had plans prepared for a new garage.

The Barker Auto Co. has removed from the town of Hartford to Plymouth, Conn.

A garage is being erected in Austin, Minn., for the occupancy of the Nolan Auto Co.

The Toledo (O.) Tire & Repair Co. has changed its name to Toledo Tire & Supply Co.

John Thompson, of Albia, Ia., plans to establish a garage in Moulton, in the same State.

William Schwartz has sold his interest in the Brenham (Tex.) Motor Car Co. to William Spitzler.

William Kingsley is about to open up in Ferbault, Minn., under the style Central Auto Garage.

I. J. Heilbron, an accessory dealer in Pensacola, Fla., is about to open a garage on Chase street.

Forstner Bros., of Madelia, Minn., have purchased a building which they will remodel for garage purposes.

Alvah Beenblossom of Washington, Ia., has purchased an interest in a garage in Grinnell, in the same State.

The Haynes Automobile Co. has established a branch in Sacramento, Cal. It is in charge of George E. Valerius.

O. M. Driscoll has opened salesrooms and a service station in Trenton, N. J., at 24 East Front street; he will stock Hupmobiles.

E. D. Powell has disposed of his interest in a drug store in Audubon, Ia., and has purchased an interest in a garage in Lawrence, Kan.

The Iowa Taxicab Co., of Davenport, Ia., has been sold by Dennis McEnery to Edward Slavin; it is located at 113-15 Commercial alley.

Mark Wentworth and Charles W. Brenn are about to open a garage in Newport, Me. They have purchased Main street property for this purpose.

The Florida Motor Co., of Jacksonville, is about to establish an agency in Pensacola, Fla. The company is State agent for Stearns-Knight cars.

J. M. Lawrence has entered the trade in San Jose, Cal. He has secured salesrooms on South Market street and will handle trucks and pleasure cars.

F. B. Callender, of Wichita, Kan., is about to establish an agency in Hutchinson, in the same State, at 116 South Main street; he will handle the Cadillac.

The Bonde Motor Car Co., of Fargo, N. D., is about to build a garage and salesrooms, 25 x 125 feet; the company handles Warren and Hupmobile cars.

Charles Kloppmeyer has entered the trade in Washington, D. C., and has erected a salesroom at 14th and W streets, Northwest; he has the Hupmobile agency.

M. R. Kauffman, of Long Level, Pa., and Bird Kauffman, of York, in the same State, are preparing to establish a garage business in Wrightsville, another Pennsylvania town.

Andrew Carpenter has entered the trade in Adrian, Mich. He has purchased the Auto Inn, formerly operated by Malcolm Kinney and Edward Shields, and will conduct a garage.

The J. E. Marsh Elevator & Machine Corporation, of Baltimore, Md., is about to engage in automobile repairing; the new branch of its business will be conducted in recently acquired premises at 216 North Holliday street.

Carl Zeust, a former electric car salesman, has established a Rauch & Lang agency in St. Louis, Mo., at Delmar and Clarendon streets; the agency was maintained for a number of years by the Union Electric Co., a power company.

The Horn Automobile Supply Co., of 2121 Farnam street, Omaha, Neb., plans to erect a two-story building near its present location; the company's capital stock was recently increased to $35,000 and the business is to be enlarged.

The Himes Motor Sales Co. has been formed in Toledo, O., with M. R. Himes, a former garageman, as its head; salesrooms have been secured at 919 Jefferson avenue and Reo and Moon cars will be sold in the territory about Toledo.

The Fritchie Electric Auto Sales Co. has opened up in Los Angeles at 1432 West Pico street; Robert H. Reid and Clyde H. Osborne, the latter the secretary of the Fritchie Automobile & Battery Co., of Denver, Col., are in charge.

E. G. Dann, former manager of the Dann-Dodge Co., of Chicago, has withdrawn from that company and has formed the Cutting Motor Co., of which he is president; A. W. Mackey is secretary and treasurer. The new company will distribute Cutting cars in an enlarged territory.

The Arenz-Weihaupt Auto Co. has entered the trade in LaCrosse, Wis. The officers are: J. G. Weihaupt, president and general manager; vice-president, George W. Weihaupt; secretary and treasurer, J. S. Arenz; sales manager, S. Bovee.

Maumee Motor Car Co. is the style under which a new business is about to be opened up in Toledo, O. Edwin M. Stone is the organizer of the company, which will handle Empire and King cars in Northwestern Ohio, Southern Michigan and Eastern Indiana.

F. L. Hoaglin, who has operated the Waupaca (Wis.) Garage for five years, has sold the business to Van A. B. Nelson; the deal carries with it the Ford, Overland and Cadillac agencies. Hoaglin and G. C. Ritchie will manufacture a patented funnel known as the No-Spill.

The W. E. Allen Co., of Milwaukee, Wis., which is temporarily located at 2807 Wells street, is about to remove to a new building at 2713-15 Grand avenue; the new structure is a garage and salesrooms and has a capacity for 100 cars. The company handles the Marathon and McFarlan lines.

John T. Stewart, 2nd, and George E. Toozer, having purchased the business of H. E. Frederickson, of Omaha, Neb., have incorporated at $25,000; the style is Stewart-Toozer Motor Co. Stewart's former Mitchell agency is retained along with the Chalmers agency which was part of the purchase from Frederickson.

The De Luxe Automobile Co., which is a reincorporation of the Warren Automobile Co. in St. Louis, Mo., has located at 3134-36 Locust street; the new company's officers are: President, P. H. Brockman; general manager, Dan W. Iseminger; city salesman, W. Harrison Comford. Warren cars will be handled as heretofore.

Digitized by Google

Byers, Lay & Byers, who formerly conducted the Elm Street Garage in Westfield, Mass., and whose place of business was destroyed by fire several weeks ago, have dissolved partnership and will withdraw from the trade; the firm comprised Edwin R. Lay, Arthur F. Byers and George H. Byers, the latter of whom has been empowered to wind up the business.

The retail sales business of the Palmer & Singer Mfg. Co. in New York City and Westchester County, heretofore handled as a factory branch at 1620 Broadway, was taken over February 1 by the Drouet & Page Co. which has located at 1890 Broadway. The concern comprises Henry Drouet, formerly of Chicago, and Frederick Page, of New York City. The Palmer & Singer company will utilize its present Broadway location temporarily for the sale of used cars and the transaction of wholesale business, but eventually will close up its affairs at this address.

Recent Losses by Fire.

Marysville, Ky.—Marysville Garage damaged. Loss, $2,000.

Joliet, Ill.—Charles Stener, garage destroyed. Loss, $3,000.

Ottumwa, Ia.—R. M. Mick, garage destroyed. Loss not given.

Tulsa, Okla.—Tulsa Motor Car Co., garage damaged. Loss, $5,000.

LeRoy, N. Y.—Archie P. McCowan, garage damaged. Loss, $4,500.

Chisholm, Minn.—W. A. Master, garage and contents destroyed. Loss not given.

Sioux City, Ia.—T. G. Northwall, dealer, building and contents destroyed. Loss, $70,000.

Detroit, Mich.—Detroit Auto Dash Co., 517 Beaubien street, plant damaged. Loss, $10,000.

Minneapolis, Minn.—S. Murphy Automobile Co., 3d street, building and contents damaged. Loss, $10,000.

New York, N. Y.—Victor Automobile Garage & Storage Co., 118-22 West 56th street, building destroyed and 100 cars destroyed or damaged. Loss, $100,000.

Chicago, Ill.—Motor Car Supply Co., 1451-55 Michigan avenue, building and stock damaged. Loss, $59,600. Hester Mfg. Co., same address; loss, $34,000. Gardner Engine Co. also sustained damage.

Cleveland, Ohio—Judd Automobile Co., 1206 Huron road, building and contents destroyed. Loss, building, $30,000, 275 cars privately owned, $300,000; Buick Sales Co., loss $30,000; Standard Auto Top & Repair Co., loss not given; Weaver-Twelvetree Co., 1216 Huron road, loss $2,000; City Auto Tire Repair Co., 1200 Huron road, loss $1,000. Total, $363,000.

BUICK DECEIVED BY USED CAR DEALER AND EXPORTER

So Says Court in Helping Unravel Tangle Over Chassis Which Fell Into Used Car Dealer's Hands —Injunction Issued.

Difficulties over a contract which sprung up in the Supreme Court for New York county last month, when the General Motor Export Co. sought to restrain the Rodney K. Haines Co., a used car dealer in New York City, from selling a number of damaged Buick chassis which it had purchased from the exporting house, were placed in a new light last week, when Justice Greenbaum declared that the Buick Motor Co., the manufacturer of the chassis, had been deceived and forbid the Haines company, as a party to the deception, from advertising the sale of the chassis and from offering them as new.

The trouble grew out of the freight car shortage of the summer of 1912, when 14 chassis, shipped from Flint to New York for export, were damaged in transit because it was necessary to ship them on flat cars and late in 1912, to dispose of them, a deal was made whereby, it is stated, Walter J. Connell, a garage and taxicab operator at Flushing, L. I., agreed to take the chassis from the export company, to use them for taxicab work and not to sell them for speculation. Ostensibly, however, to have them fitted with bodies they were turned over to the Haines company, and shortly thereafter the Buick company began to censure its exporting agent for having put the chassis into the hands of a used car dealer, who, it stated, was marketing them to the damage of the Buick company.

Several letters to the export company were necessary before it got around to bring an injunction suit against Haines, and also against Connell, but in disposing of the case the judge classified Connell as a "dummy" in the transaction and dismissed the suit, so far as it was against him; but the court declared the deal a deception on the Flint company and therefore held that the latter was justly entitled to relief. The justice in his opinion said:

"It is clear that both the plaintiff and the defendant Haines company deliberately agreed that the defendant Connell was to be a mere medium or dummy with whom a formal contract for the sale of the 14 Buick chassis in suit was to be made containing the restrictions that they 'are to be put into actual service by himself, and not to be advertised or made the subject of speculation,' and that the Haines company was the real purchaser. This was ostensibly done to enable the plaintiff, as selling agent of the Buick Motor Co., to lead its principal to believe that these chassis were not sold for the purpose of resale. The effect of the transaction was a deception on the Buick Motor Co., in which the defendant participated, and for which he may not now be heard to claim that the actual contract was the one made with Connell and not with it. The plaintiff was the selling agent of the Buick Motor Co., and within the doctrine of Wetmore v. Porter (92 N. Y., 76) the plaintiff may assert the rights of its principal and seek such injunctive relief in its behalf as the facts warrant."

Willys Takes Over Hexter's Interests.

John N. Willys, who already owned a substantial interest in the Hexter Motor Truck Co., which handled Gramm trucks in New York City, has acquired the remaining interest of P. K. Hexter, who has retired from the company. Willys at once assumed the presidency, the other officers being George W. Bennett, vice-president; H. K. Sheridan, treasurer, and Royal Scott, secretary and manager, all of whom are members of the Willys headquarters staff. Hexter, however, will not retire from the truck business, as it is his intention to organize a company for the manufacture of commercial vehicles which probably will bear his own name. The first one will be a 1,500 pound wagon, but he intimates that he has a new type of truck in hand.

Minor Business Troubles.

In the bankruptcy court, in Boston, Mass., Henry T. Beal, Lloyd Makepeace and Robert Walcott have been named as trustees of George G. Reed, a supply dealer; a composition may be offered the creditors.

William G. and Philip S. Palmer, copartners in an automobile business in Hart, Mich., have filed a petition in bankruptcy; preferred claims are given as $946.77 and non-preferred claims as $1,458.27. The assets are about $1,500.

The Uhler Motor Co., of 830 South 5th street, St. Joseph, Mo., has filed a voluntary petition in bankruptcy; the unsecured claims amount to $31,130.68 and the assets to $5,805.80. Eugene Rosenbleet is president and Lewis Siegel secretary.

Judgment Follows Change in Firm.

When the withdrawal of one of the members of the garage firm comprising William R. Bennett and Herbert E. Pearsall, of Rockville Center, N. Y., caused delay in the payment of a tire bill to the United States Tire Co., the latter proceeded to court and obtained judgment, which was filed this week in the New York county clerk's office: it amounts to $201.33.

DISCONTINUING THE NATIONAL SHOWS.

However great may be outside surprise at the suggestion that the national automobile shows be discontinued, the surprise will not be shared by very many of those who actually have to do with the annual exhibitions. For several years most of the car manufacturers and the producers of parts have viewed the shows in the light of necessary evils. It required only that someone should take the initiative, as has been done by Mr. Albert L. Pope, to turn the under-current of discontent or dissatisfaction into a well defined channel, having for its end the abandonment of the annual displays in New York and Chicago.

Very many of the car manufacturers regularly have come to the shows with nothing to sell, their outputs having been contracted for by dealers far in advance, while the average parts manufacturer has presented himself each year largely because he thought his presence desirable, if not necessary, or because his chief competitor was likely to be among the "also present." In other words, if the shows served him no good purpose, they did him no harm. But the general show-going public interests him not at all, and he has but few transactions even with dealers. To what extent the exhibitions serve the purposes of the accessory manufacturers is largely problematical. There never was a show which was not followed by conflicting reports concerning the volume of business which accrued.

Regardless of such reports, however, and not taking into account the heavy expense which falls on the exhibitors, undoubtedly the point which will weigh most with manufacturers is the almost complete disorganization of their sales operations; that is probably the worst and most widespread effect of the national shows. How complete is the disorganization only those immediately concerned are fully aware, but that it is serious there is no room for doubt. During a period of two months, selling operations are practically at a standstill and the even tenor of the trade is thrown sadly out of joint.

Of late years, there are those who have been at pains to point out that the most beneficial effect of the shows is a stimulation, or suggested stimulation of business, which directly profits the dealer, and that by virtue of the fact the shows are well worth while for the dealer's sake. But whether the stimulation is as potent as alleged is a pretty question. In fact, whether it is wise to resort to artificial stimulation is an even prettier question.

It is not the first time that the discontinuance of the national shows has been broached, and whether the movement undertaken by Mr. Pope will attain that end none can say. The hearty response which has been accorded his suggestion points that way, but many things can occur in the course of a twelvemonth to divert what appears even a strong and well defined current.

Undoubtedly the most serious obstacle to the discontinuance of the shows is the likelihood that promoters without trade affiliations, and without the interest of the trade at heart, will undertake to fill the breach or breaches. If, as Mr. Pope intimates, he is possessed of a means of overcoming that obstacle, the abandonment of the shows will be rendered simple and effective.

If stimulation for the dealer's benefit is believed to be necessary, or is found to be necessary, it is logical that local shows should best and most directly serve that purpose, exactly as they already are serving it in so many cities.

SOLVING THE USED CAR PROBLEM.

The two "solutions" which are published elsewhere in this issue are the last of those to be received in season to be eligible to Motor World's Used Car Contest which was inaugurated in October last. All of the contributions now will be submitted to the three judges who will decide the awards of the four cash prizes which were offered. Their work necessarily will occupy several weeks and their decisions cannot fail to have an important bearing on what, by all odds, is the most serious problem confronting the automobile dealers of this country; and what affects the dealer, affects the manufacturer.

That the inauguration of the contest and the exchange of ideas which has resulted has served to quicken the trade's appreciation of the subject is undoubted. The many opinions and suggestions brought to light proved the contest well worth while.

To say nothing of magnificent cash dividends previously disbursed, the Standard Oil Co. last week declared a stock dividend of $40 per share, which brings the total "melon cuttings" of thirteen months to $59,000,000. Is it any wonder that the "law of supply and demand"—for money—required the 90 per cent. advance in the price of gasolene?

COURT TO DEFENSE OF MAN WHO CLAIMED HE WAS DUPED

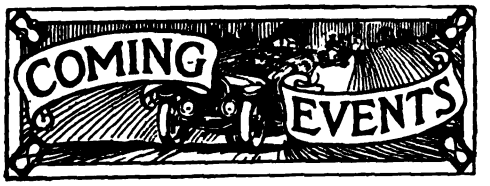
David Harum Truck Sale Undone for Expressman Who Alleges Vehicle Was Falsely Represented—Judge Censures Methods.

Those who have considered themselves duped in horse trades of a David Harum character often have sought relief through the courts, and that there is, in this respect, some similarity between the automobile and the horse worlds seems to be borne out by an action which was this week won in the Supreme Court for New York county by Irving Rafsky, a New York City expressman, who claimed he was deceived when he purchased a truck from Frederick A. Smith, Inc., of 230 West 58th street, the deal being furthered by the Motor Finance Co., the business of which is financing automobile sales; the Smith and the Finance companies were named as defendants by Rafsky in his suit for rescission of the contract and his claim that the truck was not as represented called forth comment from the court to the effect that "the representations made by Smith as to the car were undoubtedly false and untrue, and that the Motor Finance Co. had knowledge that such representations were made and were false there can be no question."

According to the various papers on file, Rafsky went to the Finance company in January, 1912, and made inquiries concerning the financing of his purchase of a truck from the United States Motor Co. for $2,000. He received no assistance, and there likewise fell through a deal whereby he was to purchase two Autocars from the Finance company. However, on February 3, 1912, Rafsky arranged to buy what he claims was represented as a 1910 one-ton Autocar from the Smith company for $1,100, of which he paid $400 cash; the remainder of the deal was handled through the Motor Finance Co., which took a mortgage on the truck and accepted from Rafsky seven notes of $100 each. About two months later trouble arose. Rafsky claimed the truck was defective in construction, was not a 1910 model, would not carry one ton, and was not suited to his purposes. He demanded his money back and asked that the contract be rescinded and, when he could not get satisfaction, he sued. Meantime the truck had been taken by the Motor Finance Co. on its chattel mortgage. Rafsky's relief in the form of the rescission of the contract was granted by Judge Newburger, who, in addition to ruling that both defendants possessed guilty knowledge or intent, said: "The mere fact that the Motor company claims to have paid a valuable consideration for the notes is not sufficient. It must not only show it has acted in good faith, but that it had no knowledge of the fraud from the inception of the transaction."

Another defeat for the Motor Finance Co. was recorded this week when J. Todd was awarded costs of $102.33 and the custody of an automobile which he bought from the Motor Car Exchange and which, when the proprietor of the Exchange left town and left his affairs somewhat tangled, the Finance company claimed and siezed.

Budd to Build Steel Bodies in Detroit.



It is the intention of the Edward G. Budd Mfg. Co., of Philadelphia, Pa., which, as stated in Motor World last week, bought the factory building of the bankrupt Grabowsky Power Wagon Co. in Detroit, immediately to enlarge the structure and produce the Budd steel bodies in the Michigan city on a large scale, land for the enlargement also having been acquired. The former Grabowsky factory itself is a modern reinforced four-story concrete building, containing 72,000 square feet of floor space, and includes a modern power plant. The Budd company, which is capitalized at $500,000, will continue to operate its plant in Philadelphia to supply the automobile trade in the East.

Mabo to Enamel by New Process.

John R. Mack, general manager of the Kosmak Electrical Co., maker of the Cubit $3 electric horn, and J. L. Bowen, who has had ripe experience in the enameling business, have formed the Mabo Enameling Works and opened up at 251 Ocean avenue, Jersey City, N. J., where they will do general enameling work for the automobile trade. Bowen is the inventor of an air-drying process which is reputed to be far out of the usual. Mack, who retains his identity with the Kosmak Electrical Co., was induced to join the new enterprise because of the almost remarkable scarcity of such enameling plants in the metropolitan district.

Delayed Truck Delivery Basis of Suit.

Delay on the part of the Atterbury Motor Car Co. in delivering a truck to S. Zimmerman, a Rockaway (L. I.) truckman, in 1909, was the basis of a claim for damages which the latter carried into the Supreme Court for Queens county and which this week resulted in a judgment for him amounting to $1,106.63; he claimed the car was not delivered until three months after the date it had been promised and he thereupon sued for his deposit of $500 and other damages. The judgment was taken by default, which may be reopened if the Atterbury elects to take such action.

February 1-8, Chicago, Ill.—National Association of Automobile Manufacturers' 12th annual show in the Coliseum and 1st Regiment Armory. Pleasure cars only.

February 3-8, Washington, D. C.—Washington Automobile Show Co.'s exhibit in Convention Hall.

February 8-15, St. John, N. B.—First annual show of the New Brunswick Automobile Association in the Drill Hall.

February 8-15, Youngstown, Ohio—Annual show of the Youngstown Automobile Show Co. in the Auditorium and Annex.

February 8-15, Hartford, Conn.—Sixth annual show of the Hartford Automobile Dealers' Association in the State Armory.

February 10-15, Minneapolis, Minn.—Minneapoils Automobile Show Co.'s show in the National Guard Armory.

February 10-15, Chicago, Ill.—National Association of Automobile Manufacturers' 12th annual show in the Coliseum and 1st Regiment Armory. Commercial vehicles only.

February 12-15, Geneva, N. Y.—Annual show in the State Armory, under the auspices of the Ottawa Valley Motor Car Association.

February 15-22. Albany, N. Y.—Annual show of the Albany Automobile Dealers' Association in the State Armory.

February 15-22, Newark, N. J.—New Jersey Exhibition Co.'s Sixth annual exhibit in the First Regiment Armory.

February 16-23, Richmond, Va.—Richmond Automobile Dealers' Shows Co.'s exhibit in the Horse Show building.

February 17-27, Kansas City, Mo.—Kansas City Automobile Dealers' Association's show in Convention Hall. First week pleasure cars; second week commercial vehicles.

February 17-22, Jackson, Mich.—Jackson Automobile Dealers' Association's annual show.

February 18-22, Baltimore, Md.—Baltimore Automobile Dealers' Association's annual show in the Fifth Regiment Armory.

February 19-22, Kalamazoo, Mich.—Kalamazoo Automobile Dealers' Association's annual show.

February 19-22, Davenport, Ia.—Annual show of the Tri-City Automobile Dealers' Association in the Coliseum.

February 22-March 1, Brooklyn, N. Y.—Brooklyn Motor Dealers' Association's annual show in the 23rd Regiment Armory.

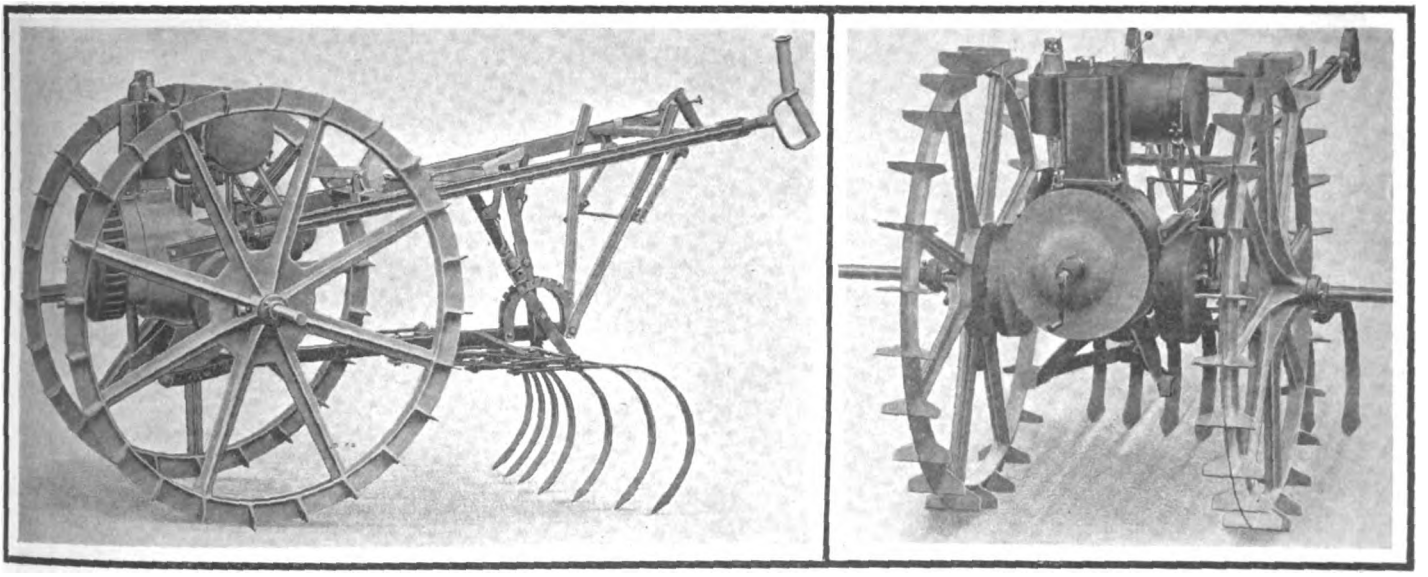
LONG LOOKED FOR GAS PLOW EVOLVED BY AN INDIANAN

Company Organized to Manufacture Funk's Ingenious Invention—Operable by One Man and Adaptable to Many Uses.

During recent years persons who profess to be possessed of the faculty of seeing around corners, metaphorically speaking, and far into the future, have been prophesying that the next really big million-maker will be the one-man gasolene plow or other satisfactory farm tractor of small size—just big enough to do the work of a single horse in ploughing and similar work and operatable by one man—and selling at a price within the means of the average farmer.

The big gasolene tractor is the natural and logical successor of the steam traction engine—and, of course, a great improvement on it—and, perhaps because there is ample precedent, it has readily found its place on the farm. The little tractor, however, has to start at the very beginning, without any ancestors, and possibly this is one of the reasons why it has been so long in coming, notwithstanding the virgin soil—both literal and figurative—that awaits it. All of which is by way of preface to the statement that a small tractor of the kind in question is about to be offered to the farmer—a machine that will do Dobbin's work at the plough and cultivator and will furnish the power for sawing wood, driving farm machinery, churning, and so on, though it will not oust the horse from his place between the shafts of the wagon.



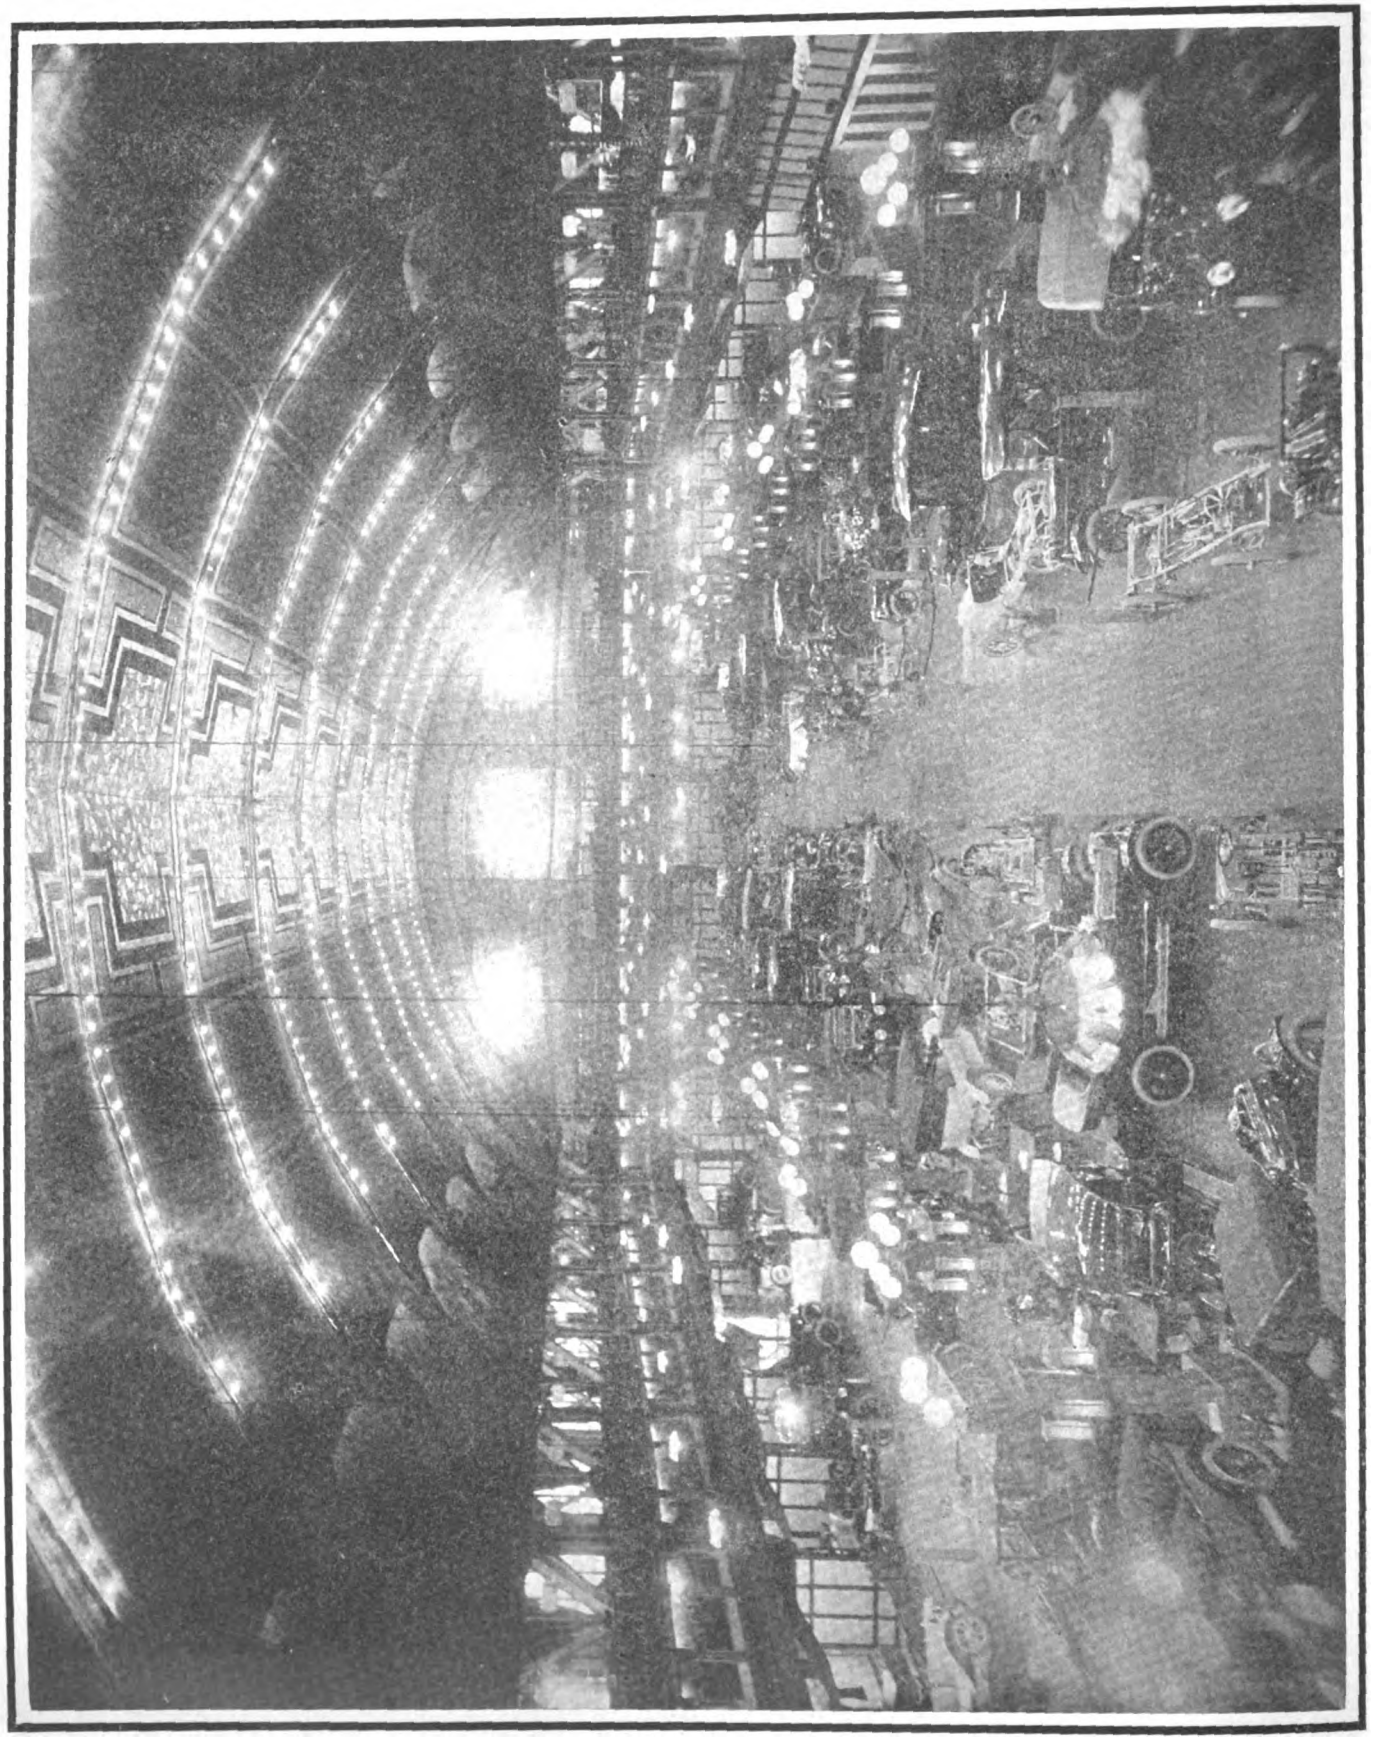
Under the name of the Universal Tractor Co., of Newcastle, Ind., a company has been formed to manufacture the machine, which is the invention of T. B. Funk, of Indianapolis, Ind., an automobile man. A plant has been acquired at Newcastle, and it is anticipated that manufacturing operations will be conducted on a large scale and that machines will be ready for the market within a short time. An excellent idea of the general appearance of the machine is given by the accompanying illustrations.

The tractor is designed not only to do the work of a horse, but to be handled to some extent in the same way as a horse. That is to say, the "driver" walks behind the machine, holding a pair of handles by means of which he controls its direction, and the speed and other levers are brought back within easy reach. There are but two wheels, mounted on a live axle, driven by a 5-horsepower single-cylinder gasolene motor carried at the center of the axle on a casing that is integral with the casing enclosing the driving and differential gears. A pair of brackets attached to the bottom of the casing serves as point of attachment for the implement to be used—cultivator, drill, seeder, etc. The weight is so accurately balanced that the driver, with the long handles provided, has no difficulty in keeping the machine at the proper level. The torque of the motor is opposed to and balanced by the resistance offered by the implement if the resistance offerd by the teeth in the soil increases the torque of the motor automatically increases in the same proportion, maintaining the equilibrium.

The wheels are of steel, of large diameter, and are provided with transverse paddle-like plates to afford a grip in soft ground. The axle shafts carrying and driving the wheels are keywayed and the wheel hubs are splined, so that the wheels can be set for any tread within the limits prescribed by the length of the shafts; the minimum is 23 inches and the maximum 42 inches.

An automatic governor on the motor permits nice control of the speed, which naturally is normally about the rate of a brisk walk. The motor has sufficient power to keep an ordinary cultivator going through heavy, sodden soil, or uneven ground, at the rate of three miles an hour with practically no vibration. A lever is provided to regulate the depth of the teeth or blades in the soil.

By applying suitable pulleys—which, incidentally, form part of the equipment of the little tractor—any machinery requiring not more than 5 horsepower can be driven; the machine will, of course, propel itself to the place where it is to work. The usefulness of the engine does not necessarily end with the day, for it can be utilized even to drive a generator to produce current to electric light the farmer's home.



SIDE AND END VIEWS OF FUNK'S ONE-MAN ONE-CYLINDER COMBINED CULTIVATOR AND PLOW

A. C. A. to Dispose of Laboratory.

Unless something unexpected happens between now and March 1 the Automobile Club of America on that date will abandon the use of its completely equipped testing laboratory at the top of the club building in New York. It has been utilized so rarely that it has been definitely decided that the annual deficit of about $5,000 incident to its maintenance is too heavy to be borne any longer. There is at least a possibility that the plant will be acquired by the Society of Automobile Engineers and removed to Detroit, or else operated in New York on a co-operative plan of some sort. Members of the A. C. A. feel that if the club must lose the laboratory it ought to go to the S. A. E., and many of the engineers are said to be enthusiastically in favor of taking it over. Whether their enthusiasm reaches the intensity necessary remains to be seen.

CHICAGO'S "CATHEDRALIZED" CARS

Western Metropolis Again Provides a Striking and Bewildering Setting for Its Annual Show—Exhibits Emphasize the Trend Toward "Sixes"—Electrics Present in Strong Force and Disclose the Result of Refining Efforts

If that man Miles who runs these here Chicago shows for the National Association of Automobile Manufacturers does not change his ways, he is likely to "get in bad" with the Society of Professional Automobile Photographers and to be the direct cause of a strike of the Descriptive Writers' Union.

From the photographers' standpoint, it was bad enough when he imported genuine English walnut trees from the vicinity of Evanston, Ill., and upreared an English country estate within the Coliseum building and set the show of automobiles under the spreading branches of the walnut trees; the Writers' Union didn't mind that so much; it is easy to call a tree a tree; but photographing trees in a subdued light isn't exactly as simple as the saying of it, and the unhappiness of the S. P. A. P. dates from about that time.

Decorations That Defied Description.

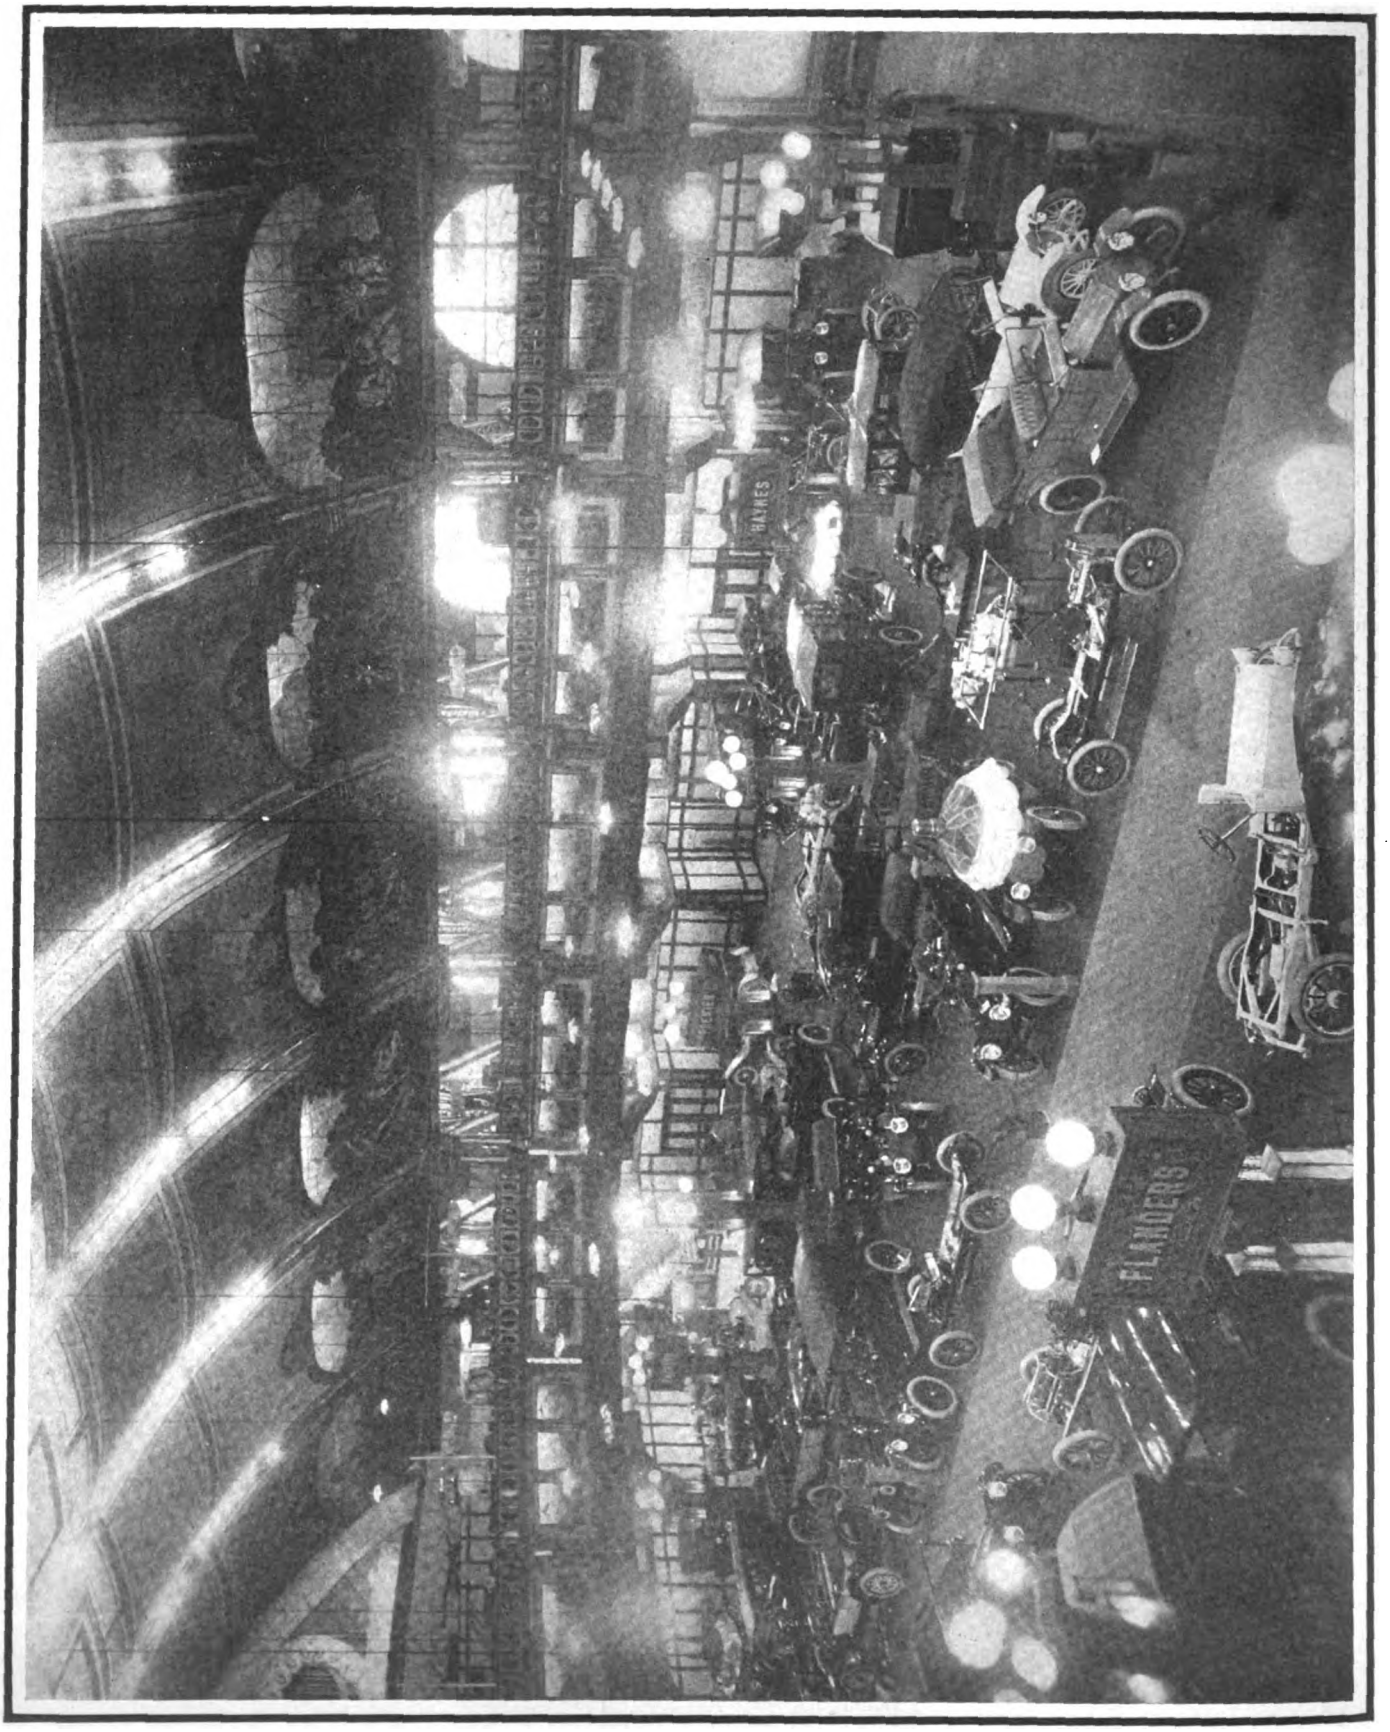
It was pretty bad, too, the following year when Miles—Samuel A.—staged the show in a Louis XV. setting and fashioned plaster of paris and other stuff into all sorts of mounds and pillars and curlycues and what-you-call-'ems and splashed them all with more colors than ever were found in Joseph's coat—that, as stated, was pretty bad; but last year, when this same Miles, with the assistance of his Chicago artists, created what they called a mosaic temple and then laid back and gave voice to a truly hearty haha when he was asked to describe it and admitted that neither he nor his artists could do it—when he did that sort of thing, the seed of discontent was planted deep in the Descriptive Writers' Union, while the Photographers' Society tore out whole handfuls of hair from the heads of its devoted members in an effort to obtain the proper light to admit of photographing the bewildering display to advantage.

Evolution of the "Cathedral" Idea.

Miles could afford to lie back and enjoy this sort of thing, for, even if he himself could not describe them, his spectacular dressings of the Chicago shows were not only original and daring but eye-pleasing beyond all doubt. The public enjoyed the spectacle, so why reck of the despair of photographers' societies or the anguish of writers' unions? In strict confidence, it is possible to state that Miles did no recking during the twelvemonth that elapsed since the mosaic temple graced the Chicago Coliseum. Instead, he dined his artists on lobster and ice cream and Russian caviar and Welch rarebit and wined them with absinthe. The result was made apparent on Saturday afternoon last, when the Coliseum was thrown open on the 13th in the Milesian line of automobile shows.

It certainly is not a crystal palace, and if the Writers' Union cared to get back at Miles for previous offenses it might say that he has profaned a cathedral by locating automobiles "in its midst." But the Chicago manager is too good a church member to indulge in profanation of the sort and, therefore, what looks like a cathedral is not a cathedral. The Writers' Union can touch lightly and call it a "stained glass show," and almost let it go at that; but the poor old photographers—what they call it cannot be repeated in print; it may sound emphatically artistic, but it doesn't look like it in cold type.

ONE OF THE ORNATE LAMP STANDARDS



Woes of the Men With Cameras.

Finding a name for what-you-call-'ems is hard enough, but when the chaps who operate cameras try to reproduce greens and yellows and blues and purples and every other old color that human mind ever conceived—and try to do it under a dome which is darkened by the very profusion of such hues—oh, say! when those camera chaps try to earn their salt under such conditions, their mouths foam and happy is the one who purchased a return ticket to his home. At best, theirs is a more or less hit-and-miss business, and—take it from the photographers who have snapped the Chicago shows—their misses are as numerous as the sands of the sea and their hits almost as scarce as the hairs on Reilly's head. As witnesses, let the court summon one Nathaniel Lazarnik, one Fed Spooner or one Charleywells, and, if need be, the world-famous John Doe.

Why Mirrors Are Few and Small.

Originally it was the intention to so mix stained glass effects and mirrors that the Chicago show must be styled a crystal palace, and although the National Association of Automobile Manufacturers and the Automobile Board of Trade—the latter of which fathered the New York show—occupy adjoining offices, with a connecting door between them, this Mr. Miles was not even let into the secret of the decorative scheme of the New York function. When he beheld the New York show itself and saw the use made of mirrors, and heard the Board of Trade dub its show—at least, that part of it

CLOSE VIEW OF THE "UPPERWORKS" SHOWING "TREATMENT" OF GALLERY AND THE "CATHEDRALIZED" PANELS

staged in Madison Square Garden—a crystal palace, this Mr. Miles, he did not exclaim ha! ha!; he said dammit and other things along that line.

When he had ceased to exclaim, he called together his Chicago trusties and made plain that, so far as concerned Chicago, a great and immediate shrinkage of mirrors was imperative. And the Chicago artists proved themselves equal to the task. Here and there on posts in the Coliseum and elsewhere there is a strip of looking glass, but of mirrored expanses there are none, but there are "stained glass" effects aplenty, also a bewildering revelry of colors.

Primitive Man in "Stained Glass."

Likewise there is a near-art gallery of "cathedralized" pictures drawn apparently from the Adam and Eve period, or soon thereafter. At any rate, the people in the pictures all are clothed after Mrs. Eve's own fashion. They look down upon the show, and if one is religiously inclined he may almost see religion in these pictures, even though a centaur that figures in several of the paintings is not known to have figured very largely in religious lore.

Although Chicago this year is housed in three buildings, as always the Coliseum is the "show place." It is there that the decorative hand finds the most room for its deft workmanship.

Decorative Scheme in Detail.

The arched roof itself is concealed by an enormous painting, the very center being a simulation of stained glass in two shades of blue. Adjoining the "stained glass" on either side are huge squares suggesting tapestry, which is half blended into heroic panels with mythological nude figures to which a "stained glass" touch also has been given. From the dome are suspended 100 small stained glass lights. The ends of the building are concealed by drop curtains, one of purely decorative design, the other suggesting an extension of the Coliseum and a stairway leading to it.

The rail of the gallery, on which the accessories are displayed, has been concealed by false work of red and gold and of a new and striking design. Directly below the rail, and where mirrors were to have been, is in many respects the cleverest conceit of the entire decorative theme—a series of landscapes framed in blue and gold and each separately lighted from above.

With all their skill and ingenuity, however, the Chicago decorators have not yet found it possible, artfully or artistically, to conceal the huge steel girders which support the dome and intrude on the gallery. They are there in all their nakedness, slightly softened only by a drapery of bunting. The exhibitors' signs on the gallery are of dark blue with gold lettering and are suspended from gold standards.

Main Floor "Cleaner" Than Usual.

The decorative treatment of the main floor itself is less obtrusive than in other years but none the less effective. There are gilded or bronzed standards of shapes which are reminiscent of last year's indescribable what-you-call-'em designs and that rear themselves high and are topped one by a cluster of five stained glass globes, the other,

Digitized by Google

of slightly different design, by three similar globes. The latter standard carries the exhibitors' name, the letters, in gold, standing in relief on a square design of mottled and hammered bronze. At the corners of each separate central exhibit are gilded posts surmounted by potten plants.

Those exhibits on the main floor that are staged under the overhanging balcony have a background of green set in black wood framework. The under side of the gallery is concealed by a tapestry effect, the beams being hidden by a design of dark blue water and water lilies that are not so blue.

Embellishment of the Annex.

The Coliseum Annex, which directly adjoins the main building and is practically a part of it, has no lofty dome and does not lend itself to extreme decoration. The tapestry effect is carried onto the ceiling and the upper half of the wall, the lower half being hidden by the green background and dark framework. Long, narrow mirrors are set in the posts.

On the second floor of the Annex, the only decoration is a series of shields of heroic size pinned to the walls, each shield edged in red, white and blue and showing, in apparent relief, some form of vehicular progress from prehistoric time to the motor car of the present day.

The basement of the Annex, into which comparatively few penetrate, is more chipper than ever before. The green background and dark framework cover the walls, and there are mirrors on the posts, but for once not bunting but a frescoing of flowered design hides the uninviting rafters.

The Wilson building, which was brought into use this year for the first time, is dressed in keeping with the Coliseum Annex which it directly adjoins. The tapestry effect is on the ceiling and the upper wall and the green and black design on the lower hall.

Armory in Green and Gold.

"You're in Pneumonia Alley, even if you dont' know it," is the cheerful cry which greets those who leave the Coliseum display to visit the other half of the Chicago show located in the First Regiment Armory. It is the same old alley, but the man who loudly imparts the cheerful information was a newcomer who was "barking" for a drink dispensary which somehow has found a means of obtaining an opening into the alley. As always, the alley is cold and windy and the barker's suggestion of pneumonia was coupled with the plain intimation that the way to avoid it is by "warming up" in his establishment.

The armory itself suggests only faintly the "stained glass" or cathedralized theme of decoration. The light well is not concealed by "stained glass" or Adam and Eve effects but by the simple green and yellow bunting which has done duty in other years, and from the ceiling is suspended no fanciful or softly glowing lamps, but good old arc lights, and hanging greenery.

The relationship of the Armory and the Coliseum is more strongly apparent in the gilded and imposing lamp standards topped by "stained glass" globes; they are of the same pattern. The lower walls of the Armory also are hidden by the green with black framework, the upper portion being of yellow, which scheme of decoration also is applied to the overlooking gallery.

Bravery of Show and Salesmen.

But whether viewed from the Coliseum, or the Annex, or the Wilson Building, or the Armory, the Chicago show is a brave show and worthy of its many striking predecessors; and some of the men who display their cars amid the splendor of these trappings are brave men.

When one of them was asked to enumerate his models, he laid much stress on what he styled "the 'coop' over there." Wrinkling the brow and following his indicating finger served to make clear that at least in some portions of this great country "coop" is the equivalent of coupe.

REVIEWING THE CARS THAT ARE DISPLAYED UNDER CHICAGO'S "STAINED GLASS" ROOF

Of the 22 brands of cars that were scheduled to make their initial appearance of the year, only one failed to "come to the line," so to speak. The missing one is the Diamond T, and its failure to appear, it is explained, is due to the fact that its producers are concerning themselves more directly with the manufacture of commercial vehicles. As was to be expected, in view of the revelations of the New York show and the unmistakable trend of the trade, much of the newness apparent in the 10 gasolene cars that make up half the list of "those not shown in New York" is of the kind that best can be spelled with the letters S I X E S. Of those 10 lines, no less than five contain new "sixes," and as two of the other five always have been "sixes" and nothing else, it may be appreciated that the Chicago show is just a little bit more a show of "sixes" than was the New York show, for with very few exceptions all of the six-cylinder cars that appeared in New York appear also in Chicago.

As a matter of cold fact, very nearly all the cars of either variety—"four" or "six"—that appeared in New York appear also in Chicago, and either by design or chance they occupy very nearly the same spaces in the Coliseum and the Annex and the basement that they occupied at the last Chicago show.

Directly in the center of the Coliseum, the Peerless stand is rendered more attractive by the presence of the striking double limousine finished inside in rich brown and gold and set off with yellow dome lights, that served to draw the eyes of those who visited the New York show. Also there is a white Peerless chassis that was not exhibited in New York and, though one of the principal reasons for its presence is to make plain the Gray & Davis electric lighting and engine starting system with which all Peerless cars are equipped, it also illustrates the many individualities of Peerless construction that serve to distinguish the line.

Familiar Names in Central Spaces.

Almost in the center of the Coliseum, and occupying the very same location as last year, are the Stoddard-Daytons, than which none excites more curiosity than the big six-cylinder Knight engine mounted in a luxurious appearing touring car finished in somber tones. And, of course, no show would be complete without the Stearns-Knight cars, and this exhibit, too, has been transplanted in toto. Among the other exhibits that "moved West" with scarcely a change there is the Packard, which is complete even to the inclusion of the "cabette"; the White, with its big double limousine and a new four-cylinder touring car finished in a delicate shade of green; the Premier, which is none the less attractive by reason of the absence of the "Killarney coleen cabriolet"; the Pierce-Arrow, with its impressive-appearing arched door limousines; the underslung Americans, including the new "six" that scored a "hit" on the occasion of its unexpected appearance at the New York show; Columbia-Knights, including a new one all finished in a peculiar shade of blue; the sleek-looking Fiats; the Speedwell, with its six-cylinder Mead engine; the Stevens-Duryea line, with its curved cowls suggestive of more than ordinarily careful thought in "blending"; the Knox and the Oakland cars, with their pointed radiators; the Hupmobiles, including the eye-catching "square" coupe with its dome ventilator in the roof; the Overland and all the other well-knowns are there, and not a few of the exhibits have been "livened up" by the addition of cars of brighter hue or different form.

At the Locomobile stand, for instance, there is both the double limousine finished

Digitized by Google

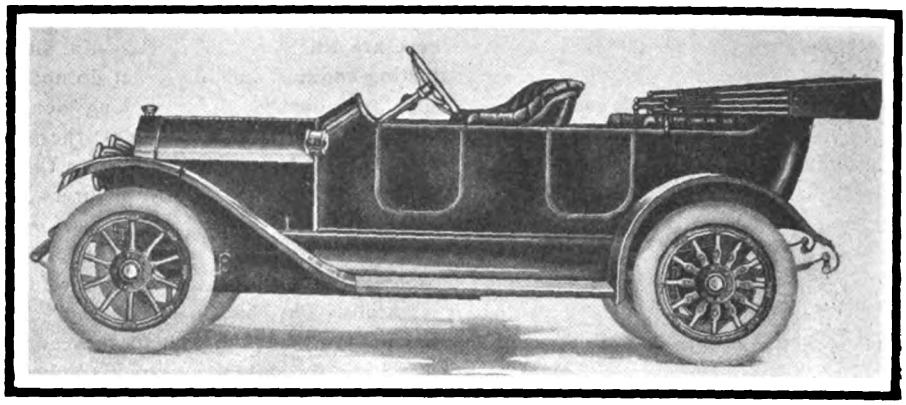
in red and gold and the other finished in gray and silver that were shown in New York and, in addition, there is another car scarcely less pleasing in appearance. It is a touring car finished in gray with a broad band of pink at the top of the body line and wheels trimmed with the same shade of pink. Almost next to it, and flanking the "pin-wheeled" car that proved such an able demonstration of the air-cooling principle at the New York show, there is a yellow and black Franklin touring car, the coloring of which is well set off by the slanting hood and the straight-line body. A little

Where bright colors fail to hold attention, there are the moving exhibits—the silently starting engines, and some that do not start quite so silently, the "working" engines and the chassis that "run" under the gentle persuasion of electric motors. Also there is a lecturer, or, rather, two lecturers, who discourse the whys and the wherefores of Rambler cars to a crowd that does not even stop wondering after the most careful explanations. The "internal economy" of the Hudson—the crankshaft with the camshaft right back through the gearset to the rear axle—is polished and working as smoothly as it was in New York; the Reo engine is started with the aid of its "self-starter," as the talkative salesman calls it, as much as it ever was; Cartercar wheels whirl in the Annex when the silently rotating disks of its friction transmission are brought together; the Chalmers "factory exhibit" is there complete, even to the "factory man" in overalls and a jumper; and over in the Armory, Great Western parts are shown on a revolving table that revolves so fast that no one can keep pace with a single part long enough to examine it carefully.

offer. Among all the "sixes" that make their initial appearance, there is only one real surprise, and that the Colby. Every one knew, for instance, or ought to have known, that there would be new Staver, Midland, Crow and McIntyre "sixes," for the information was conveyed in Motor World's great Before Shows Issue, which appeared three weeks before the New York show opened its doors. Consequently, there is nothing new in the mere knowledge that these new "sixes" really have appeared, though there is not a little that is new in the cars themselves.

ONE OF THE ARMORY AISLES IN WHICH ELECTRIC CARS HOLD FULL SWAY

further along, a clever gray Garford roadster blinks a baleful single "eye," the rays of which glint on the polished side of still another Garford not seen by New York eyes—a brown creation upholstered in cloth instead of in leather. Color is a great deal more rampant than it was at the New York show, and wherever the eye may light it is nearly sure to encounter "something lighter and something brighter"—here a yellow-banded brown Pope-Hartford, there a cream-colored Kissel roadster, a red Cole "six," a still brighter red Glide roadster, a dark green and gold Winton roadster, and almost any number of others, including the gold and white Krit that appeared in New York and the not altogether inappropriately white White.

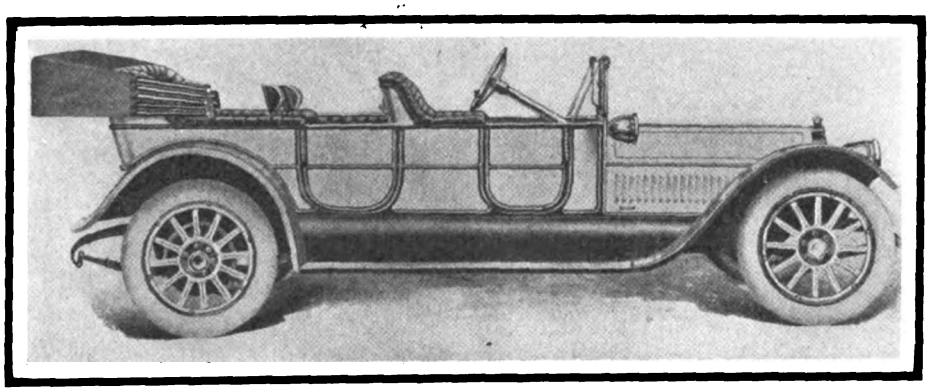


Surprise in the "Sixes" That Appear.

But to get back to what is new in the show—what is new to those who already have seen what the New York show had to

In the new Colby "six," which, by the way, lists at $2,500 and is completely equipped at the price, there is apparent a studied attempt to produce an harmonious whole in which no single fixture or feature obtrudes itself too suggestively. The lines of the body are well blended and the manner in which the windshield is attached to the deep skuttle dash is only one little indication of the careful manner in which the plans have been laid down. The windshield is made an integral part of the cowl; there is no filler board and there are no rods, struts or straps to obstruct the vision of the driver or the passage of his body. As for the essentials of the car, they reflect no less careful thought in selection. The motor forms the principal portion of a three-point

Digitized by Google



supported unit power plant, which, as should be the case, includes also the electric lighting and engine starting equipment; bore and stroke are 4⅛ x 5¼, respectively. For the rest of the car, suffice it to say that such standard products as Timken axles and Gemmer steering gear and other equally well-known parts enter into its make-up; the wheelbase is 135 inches.

SIDE VIEW OF NEWEST COLBY FOUR-CYLINDER MODEL

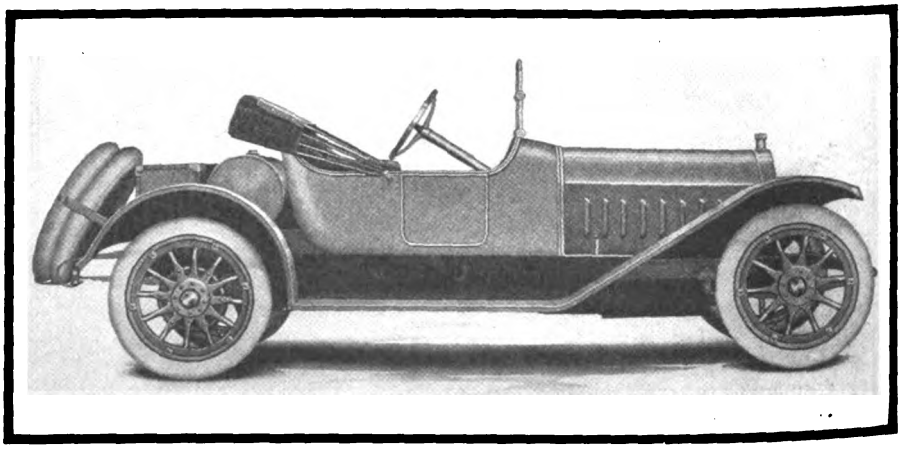
New "Fours" That Swell the Ranks.

Carrying the same construction to its logical conclusion, which means through the rest of the line, two brand new "fours" which also make their initial appearance, make up in a measure for the absence of the underslung Colby, which appeared first at the last Chicago show. Of these two, the smaller is essentially a duplicate of the "six" with two cylinders left off and a Thurber rotary air starter in the place of the electric starter; the larger has a 4½ x 5½ motor and all have their steering gears at the right side with the gear shift and emergency brake levers placed in the center of the footboard.

AUSTIN MODEL "77" WHICH HAS LONGEST STROKE MOTOR

Increasing Popularity of Block Casting.

Apparently, the popularity of block casting for "sixes" grows apace, for of the four other new "sixes" both the Staver and the McIntyre have block-cast motors, while the McFarlan, which is not new, though it is almost new because it has a new motor, appears for the first time with all of its six cylinders in a single compact casting. Thus is rigidity obtained, efficient cooling ensured and a multitude of disadvantages inherent in singly cast cylinders overcome; not the least of which is the difficulty of obtaining and maintaining perfect alignment under possible frame weaving and generally bad road conditions. Another feature of construction which is common to all three motors is that in each the intake and exhaust valves are located on opposite sides of the cylinders, thus lending greater emphasis to the accomplishment of a method of construction which not so very long ago was viewed as practically impossible.



Comparing these three motors as regards their cylinder dimensions reveals that the Staver measures 4 x 6, leaving plenty of room for the development of the 70 horsepower at which it is rated; the McFarlan dimensions are the same, and the McIntyre motor measures 3½ x 4½, thus more properly being in the "little six" class; it is rated at 40 horsepower. Except that these three motors are all "sixes," they have very little else in common; each has its own individualities.

Thus, for instance, the Staver motor is an exceptionally clean appearing casting with the manifolds integral and the carburetter carried at the end of a very short intake pipe of liberal dimensions. Another of its peculiarities is the manner in which the lighting generator, which is a Berdon instrument, is driven. Instead of being driven from a straight-through shaft, as is the usual manner, or by chain, it is driven by internal gearing cut on the inside periphery, if such it may be termed, of the pulley from which the cooling fan is driven; the arrangement is shown by the accompanying sketch.

Variety in Generator Mountings.

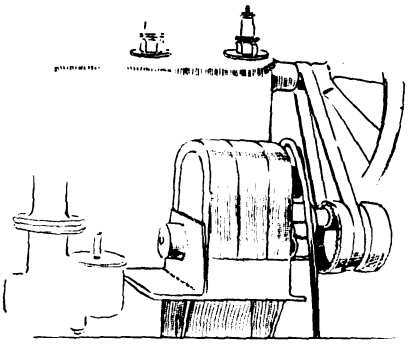
In the McFarlan motor, on the other hand, the lighting generator, which forms part of a Vesta system, is mounted nearer to the flywheel and is driven from the pump and magneto shaft in the orthodox manner. This motor also is noticeably "clean" in appearance and, despite its equipment, of lighting generator and a four-cylinder air compressor, there is plenty of room to get at the valves and to make necessary adjustments. The method of driving the air pump, by the way, has been changed slightly, and that handy device now is driven from the timing gear train by means of a short shaft and a positive clutch instead of through gearing. The pump serves also to supply compressed air for the starter, which consists essentially of a rotary distributing valve which admits the air to the cylinders in the proper firing order until they take up their own cycle of operations.

First glance at the McIntyre power plant reveals a rugged-appearing motor set ex-

MIDLAND "SIX" ROADSTER WHICH SELLS FOR $2,385

Digitized by Google

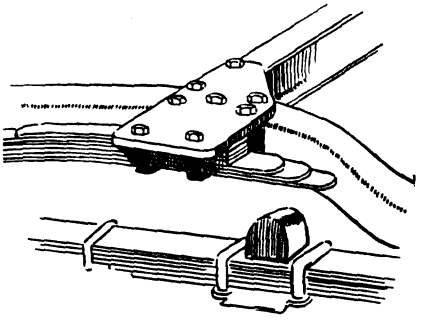
ceptionally low in the frame—so low, in fact, as to suggest that in obtaining the stability which the construction permits road clearance must have been sacrificed. But such is not the case; in fact, the road clearance is even greater than it is in the avearge car, the lower extremity of the flywheel, which is the lowest point, being nearly a foot from the road surface. Despite this fact, however, the center of gravity of the car is low, the bulk of the weight being practically in the same plane as, or lower than, the center of the wheels. That the motor itself is distinguished by the latest engineering practice is revealed by the fact that the camshafts are driven by "silent" chain. The lighting and starting equipment is from the shops of the Westinghouse company.



Short Center Control Levers Increasing.

To get a little further back and examine the cars that mount these motors, all three have well proportioned bodies in which deep skuttles are prominent. In the McIntyre, the skuttle is so deep that it has been made to do duty in carrying the gasolene tank, which is filled from the outside in approved fashion through a large opening. Incidentally, and also reflecting modern practice, the windshield is not an accessory either in appearance or fact. It is supplied with the car and is cleverly built in place and supported by short struts forward to the dash proper. The upholstery is deep and the seats wide and no hindrance to the entrance and exit of the driver is offered by the single short control lever placed in the center of the footboard; the car is driven from the right side.

The same short levers placed in the center of the footboard also are a feature of the Staver "six," only there are two of them—one for the gear shift and one for the emergency brake—as against the one used in the McIntyre. Also, as becomes the larger motor, the Staver car is larger all over—it is a much heavier and roomier car, as might be expected from its higher price. One of its little "kinks" that ought to relieve fatigue while at the same time improving appearance is the manner in which the upholstery is carried clear along the tops of the doors to form an effctual "buffer" for thoughtlessly wielded elbows.



Radius Rod Elimination Continues.

As for the other cars in the Staver line, they reflect in an unmistakable manner the general tendency toward the elimination of as many parts as possible, the particular parts that have been eliminated being the radius rods, which feature is held in common by a great many other cars in which simplicity has been made a fetish. The springs take the place of the radius rods in all the Stavers; they are firmly shackled at the forward end to permit of rigidity of drive. Another noteworthy feature of the rear springs, which are of the three-quarter elliptic variety, is the manner in which a few of the top leaves have been extended past the spring bracket to act as a stop for the rubber buffer mounted on the axle. The idea is not new, of course, though it is new for the Stavers. By way of supplying the generally prevalent demand, both the "six"

STAVER DYNAMO DRIVE

and the smaller of the two "fours" have their steering wheels placed at the left side for the first time. Both of these models are equipped with Esterline electric lighting and starting equipment, and on the larger "four," which is rated at 55 horsepower, the option is given of either air or electric starting apparatus.

STAVER SPRING AND BUMPER

The McFarlans, of course, always have been equipped with air starters, though, as already has been mentioned, the method of driving the air pump has been much improved, the net result of the new arrangement being greater quiet and a more positive drive. Also, there has been added a Vesta electric lighting system and the rest of the equipment has been increased simultaneously with a change from semi-floating to full-floating rear axles and from an under-the-seat gasolene tank to one located in proximity to the rear axle, from which the fuel is fed under pressure to the carburetter. All of these improvements are features of the one new model that has been added—the one that mounts a 4 x 6 motor—and apply also to the older cars.

Both of the other new "sixes" that make their initial appearance, or, rather, all three of them—the Midland and the two Crows—also have T-head motors, though they differ in that the Midland cylinders are cast in threes, or, as the salesman says, in "trays," and the Crow engines have their cylinders in pairs. The dimensions differ, of course, the Midland motor measuring 4 x 5 and the two Crows measuring 3½ x 5 and 4⅛ x 5¼, respectively, a "little six" and a "big six."

Enlargement of Brakes a Feature.

From the side, and barring the homogeneousness of the whole car, if such it may be termed, the most conspicuous feature of the new Midland is its exceptionally large brakes; two sets are provided, of course, internal expanding and external contracting, and the drums are no less than 16 inches in diameter and 2¼ inches wide; they are lined with Raybestos. Naturally, the body is a straight-line creation with a deep cowl, affording the maximum of protection to the driver without unduly obstructing the forward compartment. The specifications of the car include a multiple disk clutch, three-speed selectively operated gearset with the control levers in the center of the footboard and the steering wheel at the left, and full-floating rear axle; the wheelbase is 135½ inches.

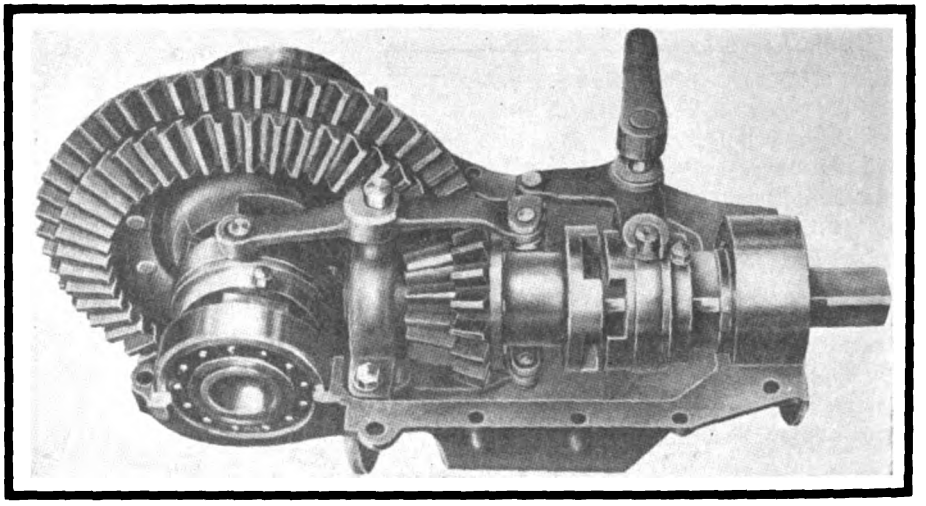
Price Revision Despite More Equipment.

Featuring the same type of integral windshield that is conspicuous on even more Western cars than it was on the products from more Easterly factories that were exhibited in New York, the Midland "four," which has as one of its distinguishing marks an unusual type of three-point motor suspension—it is common to the "six" as well—has suffered several important changes since last it was exhibited, and not the least important of them is the fact that the price has been revised and now is $1,685 instead of $2,100. And this despite the fact that the equipment has been materially increased and now includes a Gray & Davis electric lighting and engine starting system. Bodies also have been revised, the single example of Midland four-cylinder construction revealing an uncommonly "clean-looking" body with an overhanging skuttle formed integral with the front body panels. The car is larger throughout than it has been in the past, the wheelbase having been increased from 115 to 122 inches, and the control has been shifted from the right side to the left side, with the levers in the center. Reflecting the liberality of the manufacturers in the matter of equipment, either leather upholstery or "Moto-Kloth" upholstery may be had at the option of the purchaser, the car on exhibit revealing that

Digitized by Google

the latter is an uncommonly soft material, like whipcord, which does not suggest either by appearance or feel that it is thoroughly waterproof and wear-resisting to a degree not even surpassed by leather.

Crow Adopts Center Control.



Leather upholstery only is used in the Crows, and though the method of control employed is like that employed in the Midland in that the levers are placed in the center of the footboard, the steering wheel is at the right instead of the left and the gear shifting arrangement is distinctive by reason of the fact that no lateral movement of the lever is necessary. The gate change, instead of being horizontal, is vertical, a simple forward and back movement sufficing to engage any of the three forward speeds or reverse—selectively, of course. Though the arrangement is not new and has been used on Crow cars for some time, this is the first time the levers have been placed in the center of the footboard, and, as a matter of fact, that is practically the only alteration in construction that has been made during the past twelvemonth by the Crow manufacturers.

Naturally, the two "sixes" are the center of attraction, for they are new all the way through, though there is nothing radical in their make-up. The smaller of the two has its motor hung very low in the frame, thus permitting low center of gravity and a practically straight-line drive when the car carries its full complement of passengers, and both are equipped with electric lighting and engine starting systems. The larger car is a roomy seven-passenger touring model and the smaller one is only slightly less roomy, though it provides accommodations for only five passengers; wheelbases are 122 inches for the smaller and 137 inches for the other. In common with all the other cars in the Crow line, the new "sixes" are finished throughout in nickel plate and fully equipped.

Two-Speed Differential in Austin.

Of the other "sixes" unrevealed by the New York show, there is only one—the Austin—and it is the same car that appeared last year and the year before that, except that a few purely minor improvements have been made qpite as a matter of course. Thus, for instance, the air compressor for tire inflating and to operate the starting gear now is located on the gearset instead of on the engine base, the valves have been enclosed and substantial bearings have been added at the forward ends of the camshafts. Otherwise it is the same Austin it always has been, with its valve pockets cast catacornered in order to provide room for the throw of a crankshaft which reveals one of the longest stroke motors in the show—seven inches—and its familiar tan and white body.

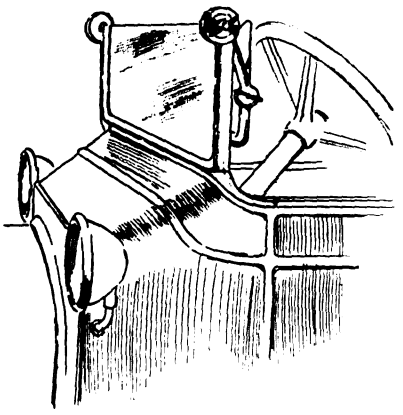
Nevertheless, the Austin exhibit, despite its familiar features, still harbors one of the few real novelties of the show, apparent in a brand new two-speed differential mechanism with which all Austins eventually will be equipped. For the present, however, it will be supplied only on demand, and at a slight additional cost. In its material aspects, the Austin two-speed axle, as it is styled, is much like the Evans and the Lancia and one or two others that have appeared within the past year or two and in which there are two bevel gears and two bevel pinions, thus permitting two rear ratios on final drive. It differs, however, in the method of engaging the gears, the arrangement being made plain by the accompanying illustration.

AUSTIN TWO-SPEED AXLE SHOWING CLUTCHING MECHANISM

Eight Forward Speeds Possible.

For the lower gear ratio, the outer bevel wheel ring, which is positively connected to the driving axles—through the differential mechanism, of course—and is meshed with its pinion, is driven by connecting the pinion to the drive shaft through a positive dog clutch. The other bevel gear, which is enmeshed with the other pinion, which, in turn, is positively connected to the driving shaft, then rotates idly. For high gear ratio, the remaining bevel gear ring is connected to the driving axles through the intermediary of a dog clutch, the arrangement of the shifting lever being such that a push engages high gear and a pull engages low speed, or vice versa, depending upon the method of "hook-up." Consequently, combining the two-speed rear axle with the orthodox type of three- or four-speed gearset results in the realization of either six or eight forward speeds and two speeds reverse.

Of the three four-cylinder cars that make their first appearance of the year—the Glide, the Pratt and the Great Western—it is difficult to determine which attracts the most, the Glide for its simple and substantial construction, the Pratt for its new 50-horsepower model or the Great Western for the big slice cut off its price, in spite of a whole lot of real improvement. The three have very little in common except that they are all completely equipped. The Pratt is new throughout, and though it contains all the previous Pratt features it also incorporates a number of departures from former construction, and both the Glide and the Great Western have been improved in a number of ways that have altered their constructions and their appearances not a little.



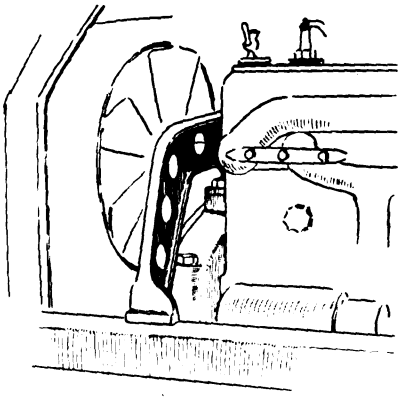
Both of the latter two, for instance, have longer wheelbases than they have had in the past—both have been "stretched out" four inches. Also, both of them have more powerful motors. The adoption of an L-head motor for the Great Western, and its support at three points on the main frame mark significant changes from previous construction in which an overhead valve motor mounted on a sub-frame was used. In order to compensate for the measure of power claimed to have been lost by the change in the location of the valves, the stroke has been increased from five inches to 5½ inches, the bore remaining the same at 4¼ inches. In the Glide the increase in power is represented by an increase in cylinder dimensions from 4¾ x 5 to 4⅛ x 5¼, thus placing the motor more properly in the long stroke class; it is rated at 38-42 horsepower and the Great Western, of course, is a "40," as it always has been.

Glide and Great Western Changes.

Another important change in the Great Western is the adoption of a full-floating rear axle in place of the semi-floating axle that has done duty in the past. The Glide rear axle always has been floating, and there has been no change in it, though a

Digitized by Google

new type of pressed steel housing has been adopted by way of increasing the factor of safety and permitting a greater degree of accessibility. Incidentally, to both the Glide

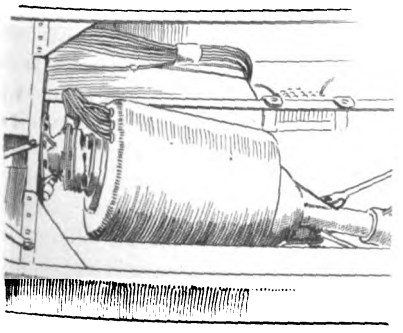


COLBY INTEGRAL WINDSHIELD

and the Great Western there has been added complete electric lighting equipment, Ward Leonard apparatus finding a place on the former and the Remy system being used on the latter. At slight additional cost, an electric starter is added to the Great Western, and the Glide already is equipped with an acetylene starter, chosen because of its simplicity.

Regarding body styles, there is not much that can be said, for neither departs radically from the standard and accepted practice. In both, the upholstery is deep and the seats are wide—particularly wide in the case of the Great Western. The Glide is steered and controlled from the left side, the levers being in the center for the first time, and as heretofore the Great Western has its steering wheel at the right. In the Glide there is a clever interpretation of the integral windshield idea so prevalent elsewhere. The shield is mounted directly on the cowl, to which it is shaped, without the use of a filler board, the glass itself being cut away to fit the curve of the dash; it is bound around with nickel plated metal, of course. The struts are very short and lead back to the dash in a manner that leaves the doors perfectly clear. There are two chassis in the Glide line, the "38-42" and a "45," which remains substantially the same, and as usual there is only one in the Great Western line.

The Pratt "50" is a new car throughout and, as becomes a new car, it is equipped with Gray & Davis electric lighting and engine starting apparatus. In adopting three-point support for the power plant which carries its dry plate multiple disk clutch and three-speed selective gearset in a unit, a slightly different method than is usual has been employed. In the older Pratt cars, the third point of support is in the rear, but in the new one it is at the front. The forward pivot is cradled in a bearing on a transverse webbed arm bearing at either

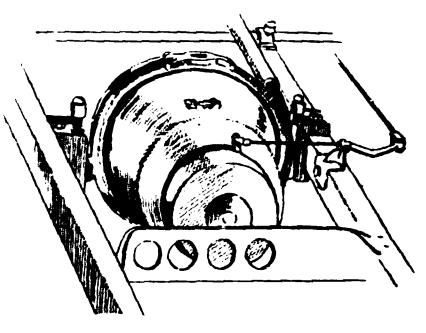


PRATT MOTOR SUSPENSION

side on the main frame, the arrangement being best made plain with the aid of the accompanying sketch. The bore and stroke of the motor are 4½ x 5¾ inches. Eleven-inch upholstery and plenty of room help to make the bodies comfortable, and everywhere the construction is orthodox, even to the placing of the steering gear at the right side with the gear shift and emergency brake levers inside the body.

PROGRESS REVEALED BY A STUDY OF THE ELECTRIC CARS

In the realm of the electrics, by far the most important development of the year, as revealed by the 11 brands of cars on view, is the widespread adoption of the direct shaft drive without the use of intermediate gears or chains. There is also apparent a tendency toward the use of larger, slower running motors to take the place of the small high-speed machines that have been



BAKER MOTOR SUPPORT

used in the past. Of all the 11 makes of electrics on view, no less than five of them—namely, Century, Ohio, Baker, Woods, and Broc—exhibit more or less radical changes in the method of supporting the motor and of driving; two others, the Borland and the Waverley, have slightly larger and slower running motors than they have had in the past, and the other three that are familiar to show goers, and those who are not show goers, alike, the Argo, the Rauch & Lang and the Detroit, remain substantially the same as far as their motors and the method of suspension is concerned, though each gives evidence of careful refinement. The Chicago electric, of course, is a brand new product that appears for the first time, and it, too, reflects the present tendency, for it is driven by a shaft without gearing other than that used in the differential.

Despite the preponderance of the direct shaft drive, however, no less than eight of the 11 makes exhibited being so constructed—counting the Waverley, which is shaft driven by a transverse shaft through herringbone gears, it is nine—no two of the cars are exactly alike, and altogether there is a great deal of variety in the method of supporting the motors and in transmitting the drive.

Examining first the five brands of cars in which the most conspicuous alterations in motor support and drive have been made—the Century, Ohio, Woods, Broc, and Baker—the Century motor has been moved further forward, though the method of drive remains the same, bringing it squarely in the center of the chassis instead of nearer to the rear axle, where it always has been. The arrangement, of course, permits a better distribution of weight, which has been further helped by splitting the batteries more nearly in halves. The Century, by the way, is one of the two cars on view in which the frame is supported beneath the axles. Also, since platform springs were eliminated by Woods engineers, the Century is the only one which retains them. Another new feature of the Century is the use of an improved type of Westinghouse

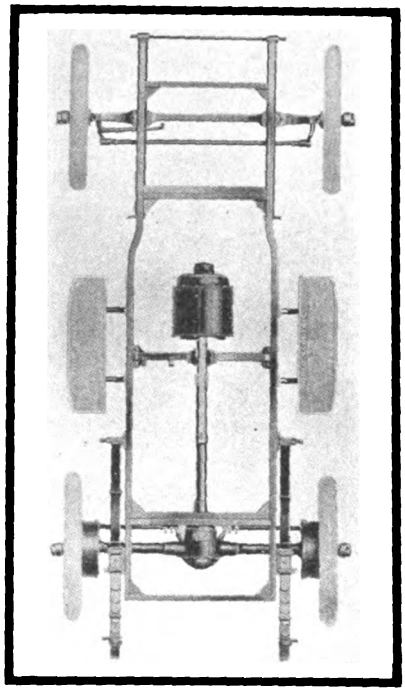
WOODS MOTOR SUSPENSION

controller in which a separate and distinct upward movement of the lever is necessary to reverse the car, thus obviating the possibility of inadvertently overloading the motor by reversing it with the car going forward.

Both the Ohio and the Baker motor suspensions are radical departures from anything that has come from either factory in

Digitized by Google

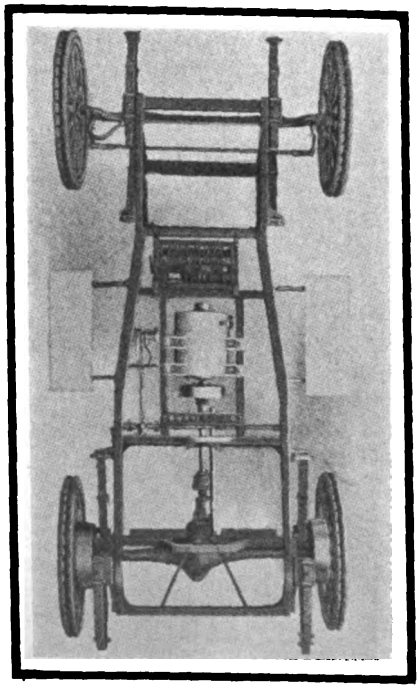
the past. In the Ohio, the motor, which is of the slow-speed type, is bolted directly to a torsion tube, thus making of these two parts a rigid unit with the rear axle. The torsion tube is spread out fan-wise at its forward end to form a substantial yoke which attaches to the motor frame at the top and the bottom, a center universal bearing—not a universal joint, for there are none in the whole construction—being placed on the cross frame member and carrying the weight of the motor. Thus the construction is rigid, it ensures positive alignment of the parts under all conditions, and at the same time permits a degree of flexibility to offset possible frame weaving.



Another important alteration, or, rather, addition, is embraced in the adoption of a new magnetic brake which operates to slow the speed of the motor and thus the car. It is actuated by means of a small button mounted on the small circular knob which controls the magnetic switches for altering the car speed. Incidentally, the Ohio model brought out last year, in which double control sets were provided has proven so popular in the interim that several new models, all with complete duplicate control mechanisms, have been developed.

Variety Apparent in Motor Mountings.

Though the Baker is shaft driven, the method of mounting the motor is quite different from that employed in the Ohio. The motor is direct connected to the propeller shaft in much the same way, and also is direct connected, so to speak, to the torsion tube, but the method of hanging the forward end of the motor is entirely different. Instead of being carried at the end of the propeller shaft and at the opposite side of the cross frame member which supports it, the shaft is shorter and the motor is hung to the cross frame member by means of a large ball and socket joint leather covered to exclude dust and dirt. Strut rods from the rear axle to small extensions at the motor end of the torsion tube effectually prevent any alteration in the proper relationship of the rear axle and the motor with its propeller shaft. Instead of being located at the forward end, as it is in the smaller Baker electrics, the first speed reduction by Renold "silent" chain is contained in a unit housing with the rear axle.



Forward Drive Cars Increase in Number.

Regarding Baker bodies, there is much that is new, though none attracts more attention than the coupe which is styled type VA. It is one of the few real coupes in which all the passengers face forward, which fact is made possible by the use of front seats which swivel. The car is longer and roomier than was its immediate predecessor and is distinctive by reason of its back, which suggests the limousine rather than the coupe; either lever or wheel steer is optional, and the top is so designed and constructed that water never is shed down

OHIO ELECTRIC CHASSIS

the sides of the car. The broughams, too, also exhibit the characteristic "limousine back" and incorporate a number of new features calculated to increase comfort.

CHICAGO ELECTRIC CHASSIS

Though the suspension of the Woods motor has been altered considerably, that change is not the most conspicuous one that has been made. The most significant change to be found in the elimination of the platform front springs that have served to distinguish Woods cars in the years gone by and the substitution of ⅞ elliptic members in their place. In altering the motor suspension, the engineers have swivelled the motor at the top and the bottom as well as the sides, thus permitting a greater degree of flexibility than was possible in the past, the arrangement being shown by the accompanying sketch. Simultaneously, the brakes have been equalized and made more powerful, a deeper drop has been put in the frame, the wiring has been enclosed in circular loom, the controller has been placed on the body instead of on the chassis, and the steering mechanism has been placed above and behind the axle, the better to protect it.

Drive Chains Eliminated by Many.

The Broc is another brand in which the method of transmitting power from the motor to the rear axle has been thoroughly revised, and in the revision the "silent" chain reduction that has been used in the past has "gone by the board," so to speak. In its place, there is a set of double reduction spur and bevel gears enclosed in the rear axle housing and the motor is direct connected to the forward end of the propeller shaft. Thus, though the chain reduction has been eliminated, the new arrangement permits the retention of the high speed light motor which always has been a feature of Broc cars. The cars themselves are quite a little bit larger than their predecessors—the four-passenger car, for instance, now accommodates five persons with ease—and to "fit in" with the lengthened wheelbases the wheels have been increased in size. Which, of course, is as good as saying that better stability and better riding qualities have been obtained by the change. Either wheel or lever steering is optional, as it always has been, and a new model in which all the passengers face forward has been added to the line. The Broc controller, in which forward movement starts the car and a pull back applies the brakes, is retained as a matter of course, though the arrangement has been improved by the addition of a locking device in the form of a small plunger, which effectually prevents the use of the car without the knowledge of the owner—provided he, only, has the key to the Yale lock.

Tendency Toward Larger Motors.

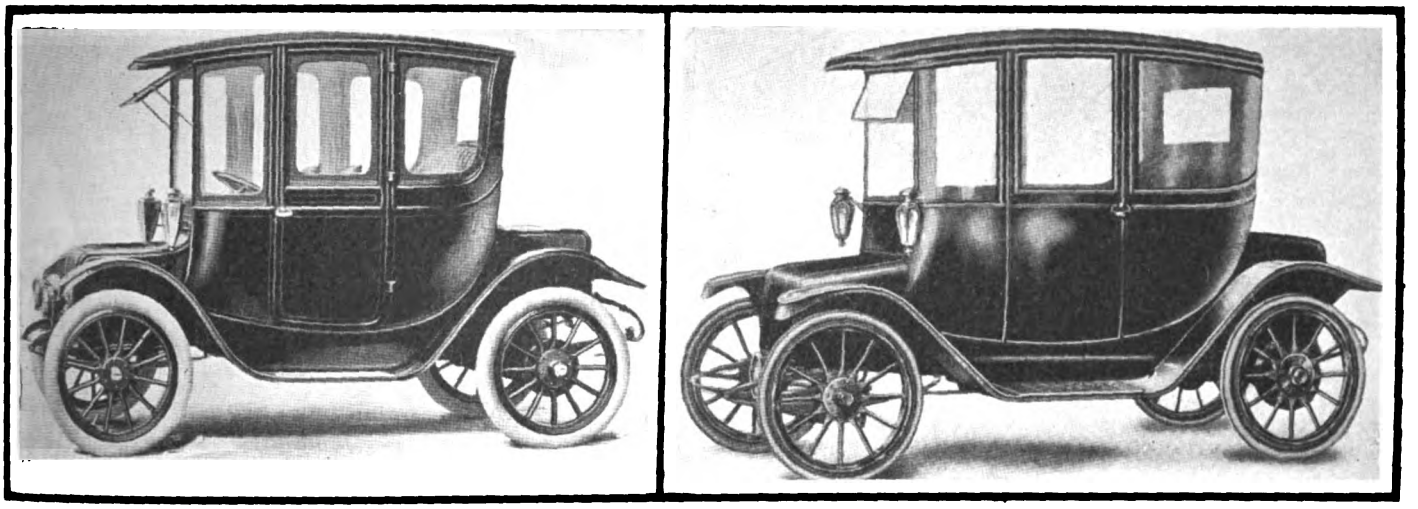
Of the other five electrics, not including the Chicago, which is new throughout, both the Borland and the Waverley have motors that are slightly larger than those that have been used in the past—the Borland is more than 10 per cent. larger and operates at a correspondingly lower speed. In the Waverley both the motor and the axles have been made heavier the better to withstand

Digitized by Google

the strain of unwitting abuse and also to increase the general efficiency of the vehicles. Batteries of greater capacity are used in both, quite as a matter of course. About the only other change that has been made in the Waverley is embraced in the addition of a set of emergency brakes on rear wheel drums and the adoption of a new type of semi-irreversible steering gear, which is calculated to minimize the amount of road shock transmitted to the driver.

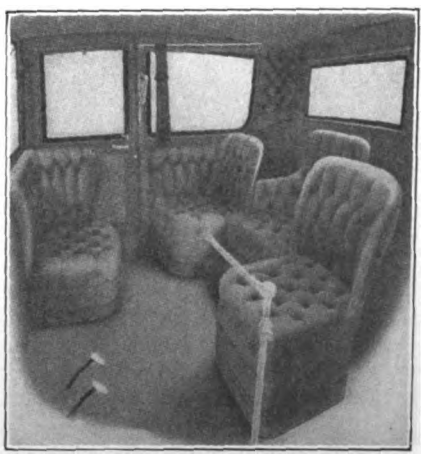
In the Borland, a ball thrust joint has been placed in the torsion tube and a well-studied attempt to reduce the annoyance of incipient rattles is apparent in the use of "anti-rattlers," or small coil springs, in all the brake parts. Incidentally, an adjustment for taking up wear in the "silent" chain reduction has been provided, as has an outside adjustment for the rear wheel brakes. At the same time, an interlock between the brake pedal and the controller has been added, the effect of which is to throw off the current automatically immediately the brake is applied, and to prevent the effective use of the controller until the brake has been released. The wheelbase of the standard chassis has been increased from 93 to 96 inches, and no less than six new models, ranging form a coupe to a full-sized limousine with outside seats for the driver and a "flunkey," have been added.

Improvement in Seating Arrangements.



In body styles, the only real novelty that the show reveals is a Waverley bro——, no, it is not a brougham, it is a limousine, or, rather, a "limousine four," as it is styled, and the arrangement of the seats is most decidedly unusual. To crib a military term, the three main seats are arranged "in echelon," which is to say, the center seat is slightly further back than the others. Thus, there is plenty room for three seats in only a little bit more space than would be required for only two seats in the ordinary arrangement—and no one interferes with any one else.

Of the other three electrics, the Detroit, the Rauch & Lang and the Argo, none is marked by radical changes in mechanical construction, though each has minor refinements in chassis and in body work. Among the new bodies, the Detroit cars loom large as truly distinctive creations; they are among the few really "clear vision" vehicles exhibited, for the driver is afforded a clear vision not only ahead of him but to the rear as well. Detroit electrics, by the way, always have been shaft driven cars—chainless shaft driven cars, to be explicit, for the power is transmitted from the motor to the rear axle through the intermediary of nothing more complicated than a perfectly plain and straight propeller shaft; the shaft is enclosed in a torque tube rigidly connected at the forward end to the motor casing and at the rear end to the rear axle housing. There is a single universal joint between the motor shaft and the propeller shaft to allow for slight disalignment.



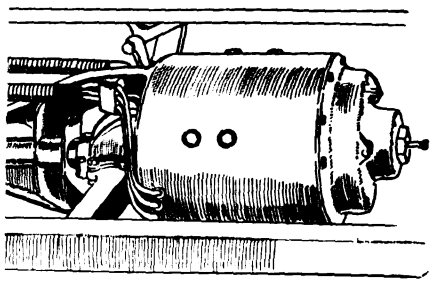
"Clear Vision" Idea Is Paramount.

In making use of the words "clear vision," Detroit engineers evidently have designed bodies and seating arrangements so that there can be no quibble about the "fit" of the expression. Which is to say, there is nothing in front of the driver to obstruct his vision any more than there is anything beside him or behind him to prevent a clear vision of the road; doors and window sashes have been so placed that they do not come in the line of vision, and by replacing the rear opaque body corners with curved glass windows, which, incidentally, materially enhance the appearance of the bodies, the driver is afforded a view to the rear also, without the necessity for straining to peer through a small center window.

All of which is made plain in all of the vehicles on view, one finished in a lavish manner in blue silk whipcord and another in gold silk whipcord, appealing particularly to the weaker sex, which, to use a slangy expression, always is "strong" for the luxurious and the beautiful. It is one of the individualities of all the cars in the Detroit line that the driver's seat, instead of being tucked away in a corner, is placed very nearly in the center of the body, where there is little likelihood of the driver being mistaken for a "paid hand" and where he is in a position to be prominent socially—at least, while in the car.

TWO OF THE NEWER TYPE FORWARD DRIVE ELECTRIC BROUGHAMS—BROC AND WOODS

WAVERLEY SEATS "IN ECHELON"



Shaft Drive Popularity Increasing.

The Argo electric is another in which mechanical alterations are few and far between, though a number of body improvements, evident in several new models brought out within the past year, have been made. In its essential elements, the chassis remains the same, practically the only alteration being an increase in the size of the brake drums, which now measure 16 inches in diameter. The motor support and the method of drive remain the same, the motor being carried in a cradle on large combined tubular radius and torsion rods which unite in a hardened steel ball of large

Digitized by Google

diameter which, in turn, is supported by a spherical aluminum bronze socket. Drive is direct by shaft to the rear axle, where a double reduction spur and bevel gear is contained within the axle housing. Similarly, the method of control remains the same, a pedal serving to apply the power and also the brakes. In one of the new models exhibited for the first time, the driver's seat, placed forward, is a stationary chair, the other front seat being arranged to swivel so that the passenger may face in any direction, including forward. The rear seat is large and deeply upholstered, with plenty of leg-room between it and the front ones.

The most noticeable change in the Rauch & Lang electrics, paradoxically enough, scarcely is noticeable at all; the brakes have been made a little larger, the wheelbase of the standard chassis has been increased some 2½ inches, and the chassis has been lowered slightly to provide greater stability and to facilitate entrance and exit. On all of the models there has been added a separate rain-vision windshield outside of the regulation front glass panel, the effect of which is to prevent collections of rain on the inside glass obstructing the vision of the driver and his passengers, for, quite as a matter of course, all passengers face forward in the newer models. Two of the new features which have been added include an arrangement whereby the signal bell is caused to ring if any attempt is made to apply the power while the brakes are set, and an interconnection between the swiveling driver's seat and the control mechanism which automatically shuts off the power the instant the seat is turned in any direction other than facing forward. As heretofore, all batteries are accessible from the outside, thus obviating the possibility of acid damage to the upholstery and permitting the car to be locked while garaged and undergoing repairs.

OHIO MOTOR SUPPORT

Strictly speaking, there is only one really new electric in the show, and that one is the Chicago, which only a short time ago was put upon the market by the Chicago Electric Motor Car Co., of the Illinois city for which it is named, and which makes its first formal appearance. Taking their cue from those eminent gasolene car engineers who achieved an undoubted hit with the development of the arched door, Chicago electric engineers have adopted the idea as their own, thus marking the entry in the electric ranks of a style which heretofore has been used exclusively by the makers of spirit propelled cars. Briefly, the arched door is the most conspicuous point of difference between the Chicago electric bodies and any others.

Mechanically, the car is standard throughout, though there are several individualities that give evidence of careful thought. The motor, for instance, is solidly hung on the main frame by means of four extending arms and drives to the rear axle through the intermediary of a straight propeller shaft in which a pair of universal joints permit of the necessary flexibility. The brake, instead of being placed ahead of the motor, which is usual, is placed behind it and direct on the propeller shaft, eliminating the necessity for transmitting braking strains through the armature shaft. By way of reducing upkeep expense to the minimum, the chassis and the spring suspension have been designed primarily to permit of the use of cushion tires exclusively. Another distinctive feature is the use of a magnetic "blowout" located over the controller fingers, the object of which is to prevent the arcing which nominally takes place and results in burned contacts and poor transmission of the current. As a coupe the car lists at $2,800, equipped with 40 cells of 11-plate Exide battery, and as a five-passenger limousine, at $3,100.

Summary of Cars which Constitute Part I of Chicago Show

* Denotes not displayed in New York.

Abbott Motor Co., Detroit, Mich.—Two four-cylinder Abbott-Detroit touring cars and one limousine; one chassis.

American Locomotive Co., Providence, R. I.—One six-cylinder Alco touring car; one chassis.

American Motors Co., Indianapolis, Ind.—Three American cars; one each four-cylinder roadster and touring; one six-cylinder touring; one four-cylinder chassis.

Anderson Electric Car Co., Detroit, Mich.—Four Detroit electric broughams.*

Argo Electric Vehicle Co., Saginaw, Mich.—Three Argo electric cars; one roadster and two broughams; one chassis.*

Auburn Automobile Co., Auburn, Ind.—Three Auburn cars; two four-cylinder touring and one six-cylinder touring; one six-cylinder chassis.

Austin Automobile Co., Grand Rapids, Mich.—One Austin six-cylinder touring car; one chassis.*

Baker Motor Vehicle Co., Cleveland, Ohio—Four Baker electric broughams; one chassis.*

Bartholomew Co., Peoria, Ill.—Two four-cylinder Glide cars: one each touring and roadster; one chassis.*

Bergdoll Motor Co., Louis J., Philadelphia, Pa.—Two four-cylinder Bergdoll touring cars; one chassis.

Borland-Grannis Co., Chicago, Ill.—Three Borland-Grannis electric cars: one roadster and two coupes; one chassis.*

Broc Electric Vehicle Co., Cleveland, O.—Three Broc electric broughams.*

Buffalo Electric Vehicle Co., Buffalo, N. Y.—Three Buffalo electric cars: one each coupe, roadster and brougham.

Buick Motor Co., Flint, Mich.—Four four-cylinder Buick cars: three touring cars and one roadster; one chassis.

Cadillac Motor Car Co., Detroit, Mich.—Four four-cylinder Cadillac cars: two touring and one each coupe and roadster; one chassis.

Cartercar Co., Pontiac, Mich.—Four four-cylinder Cartercars: one each double limousine, coupe, touring and roadster; one chassis.

Case, T. M. Co., J. I., Racine, Wis.—Four four-cylinder Case cars: two touring and one each roadster and coupe; one chassis.

Century Electric Car Co., Detroit, Mich.—One Century electric coupe.*

Chalmers Motor Co., Detroit, Mich.—Five Chalmers cars: two six-cylinder touring, two four-cylinder touring, one four-cylinder roadster.

Chicago Electric Motor Car Co., Chicago, Ill.—Two Chicago electric broughams; one chassis.*

Church-Field Motor Co., Sibley, Mich.—Two Church-Field electric cars: one each coupe and roadster.

Cole Motor Car Co., Indianapolis, Ind.—Four Cole cars: two four-cylinder touring and one roadster; one six-cylinder touring car; one six-cylinder chassis.

Colby Motor Co., Mason City, Ia.—Two four-cylinder Colby touring cars; one six-cylinder chassis.*

Columbia Motor Car Co., Hartford, Conn.—Three four-cylinder Columbia-Knight cars: two touring cars and one limousine.

Columbus Buggy Co., Columbus, O.—One Firestone-Columbus roadster.

Crow Motor Car Co., Elkhart, Ind.—Three Crow-Elkhart cars; two six-cylinder touring cars and one four-cylinder touring car.*

Cutting Motor Car Co., Jackson, Mich.—Two Cutting cars: one each touring and roadster; one chassis.

Digitized by Google

Davis Carriage Co., Geo. W., Richmond, Ind.—Three four-cylinder Davis touring cars.

Dayton Motor Car Co., Dayton, Ohio—Three Stoddard-Dayton cars: one six-cylinder Knight engine touring car and two four-cylinder poppet valve engine touring cars.

Edwards Motor Car Co., New York City, N. Y.—One Edwards-Knight four-cylinder touring car; one chassis.

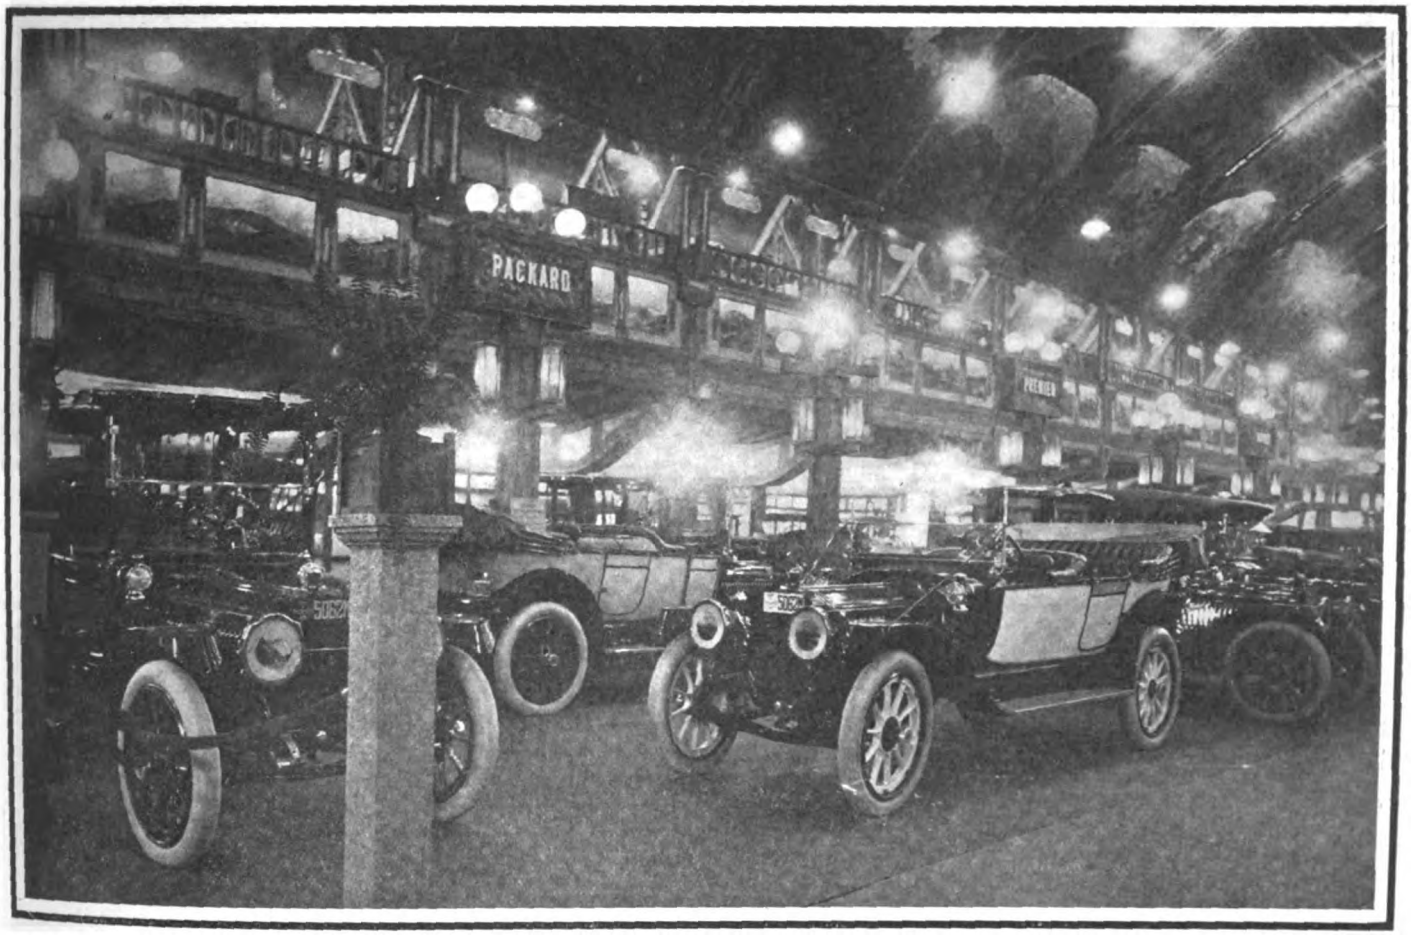
Elkhart Carriage & Harness Mfg. Co., Elkhart, Ind.—One four-cylinder Pratt touring car; one chassis.*

touring cars and one six-cylinder touring car; one four-cylinder chassis.

Henderson Motor Car Co., Indianapolis, Ind.—Two four-cylinder Henderson cars: one each touring car and roadster.

Herreshoff Motor Car Co., Detroit, Mich.—Two Herreshoff cars: one each four- and six-cylinder touring cars.

Hudson Motor Car Co., Detroit, Mich.—Three Hudson cars: two four-cylinder touring cars, one six-cylinder touring car; one six-cylinder chassis.



Hupp Motor Car Co., Detroit, Mich.—Four four-cylinder Hupmobiles: two touring each touring, roadster and double limousine; one chassis.

Kissel Motor Car Co., Hartford, Wis.—Five four-cylinder Kissel cars: three touring and one each limousine and roadster; one six-cylinder chassis.

Knox Automobile Co., Springfield, Mass.—Three Knox cars: two six-cylinder touring cars and one six-cylinder double limousine.

Krit Motor Car Co., Detroit, Mich.—Two four-cylinder Krit cars: one roadster and one touring.

Locomobile Co. of America, Bridgeport,

PACKARD EXHIBIT IN COLISEUM WITH A GLIMPSE OF THE PREMIER DISPLAY "JUST BEYOND"

F. I. A. T., Poughkeepsie, N. Y.—Two six-cylinder Fiat touring cars; one six-cylinder chassis.

Flanders Motor Co., Detroit, Mich.—Two six-cylinder Flanders touring cars.

Franklin Mfg. Co., H. H., Syracuse, N. Y.—Four six-cylinder air-cooled Franklin cars: three touring cars and one roadster.

Garford Co., Elyria, Ohio—Three six-cylinder Garford cars: one each touring, limousine and roadster; one chassis.

Great Western Automobile Co., Peru, Ind.—Three four-cylinder Great Western cars: two touring cars and one sedan.*

Haynes Automobile Co., Kokomo, Ind.—Three Haynes cars: two four-cylinder cars and one each coupe and roadster; one chassis.

Ideal Motor Car Co., Indianapolis, Ind.—One Stutz four-cylinder roadster; one six-cylinder chassis.

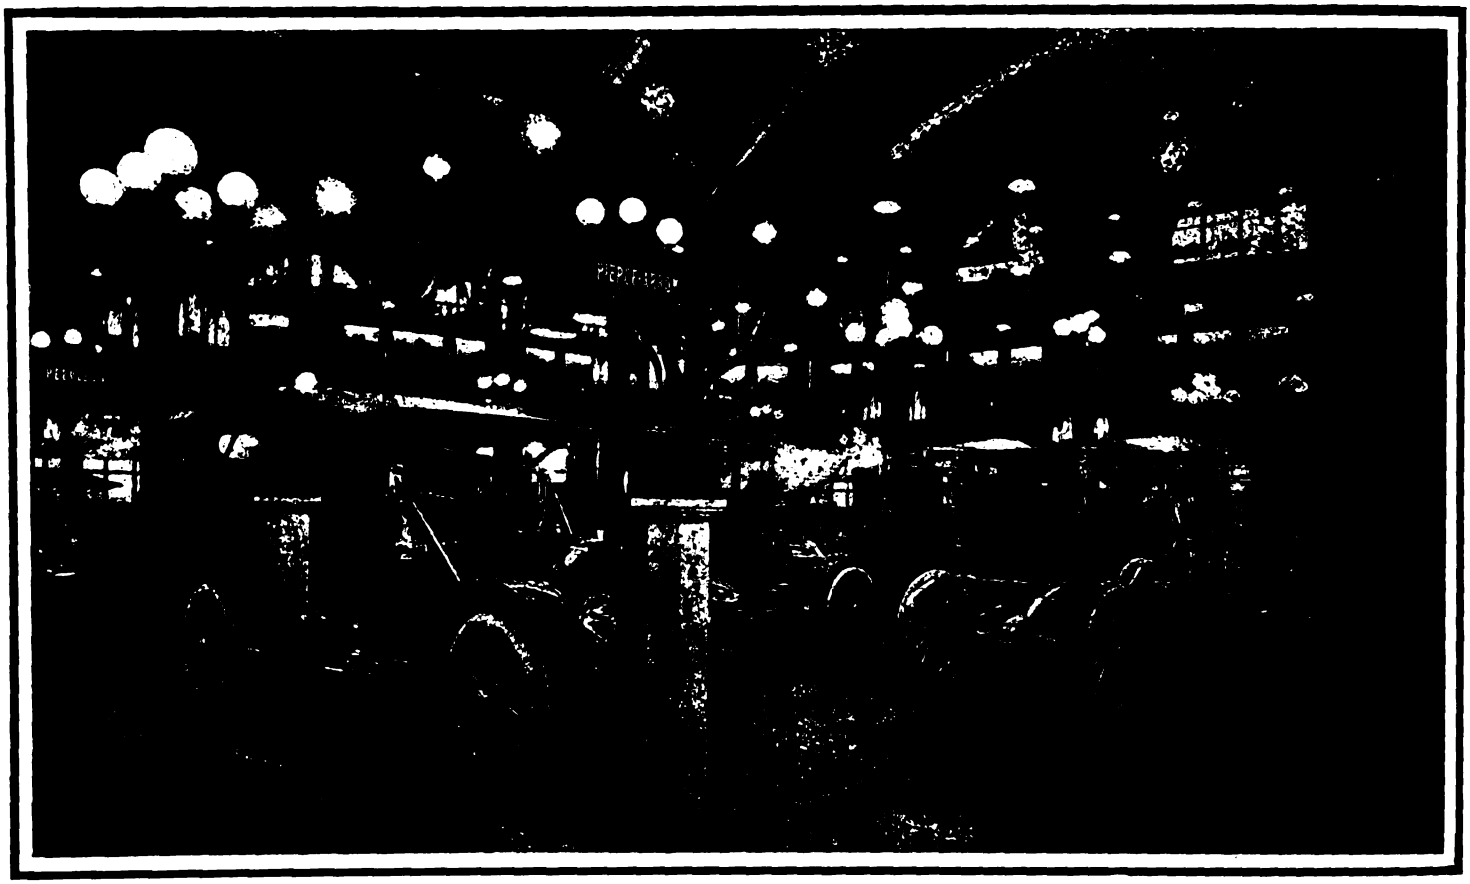
Imperial Automobile Co., Jackson, Mich.—One four-cylinder Imperial touring car.

Inter-State Automobile Co., Muncie, Ind.—Two Inter-State cars: one each four- and six-cylinder touring cars; one six-cylinder chassis.

Jackson Automobile Co., Jackson, Mich.—Four Jackson cars: two four-cylinder touring cars, one four-cylinder roadster and one six-cylinder touring car.

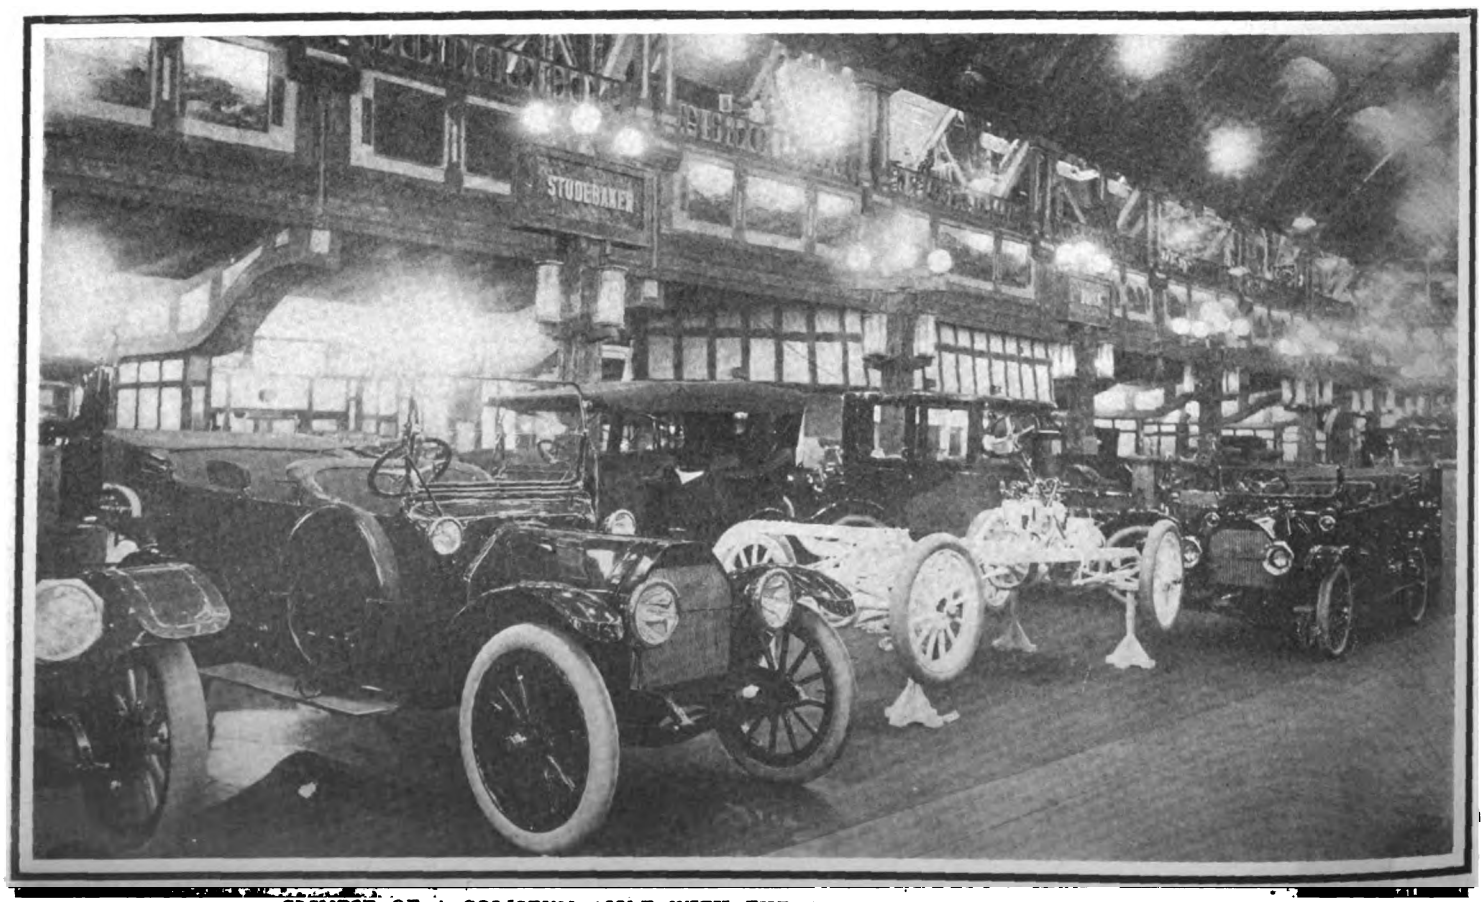
Jeffery Co., Thomas B., Kenosha, Wis.—Three four-cylinder Rambler cars: one Conn.—Three six-cylinder Locomobiles: one each limousine, double limousine and touring car; one chassis.

Lozier Motor Co., Detroit, Mich.—Four six-cylinder Lozier cars: three touring cars and one limousine.



Marathon Motor Works, Nashville, Tenn.—Three four-cylinder Marathon cars; two touring cars and one roadster.

Matheson Automobile Co., Wilkes-Barre, Pa.—One Matheson six-cylinder touring car; one chassis.



Maxwell-Briscoe Motor Co., Tarrytown, N. Y.—Two four-cylinder Maxwell touring cars.

McFarlan Motor Car Co., Connersville, Ind.

—One six-cylinder McFarlan car; one six-cylinder chassis.*

McIntyre Co., W. H., Auburn, Ind.—One six-cylinder McIntyre touring car.*

Mercer Automobile Co., Trenton, N. J.—Four four-cylinder Mercer cars: two each touring and roadster; one chassis.

Metz Co., Waltham, Mass.—Two four-cylinder Metz roadsters; one chassis.

Michigan Motor Car Co., Kalamazoo, Mich.—One four-cylinder Michigan touring car and chassis.

Midland Motor Car Co., Moline, Ill.—Two Midland cars: one each four- and six-cylinder touring cars.*

Mitchell-Lewis Motor Co., Racine, Wis.—Three Mitchell cars: one each six-cylinder roadster and touring, one four-cylinder touring; one six-cylinder chassis.

Moline Automobile Co., East Moline, Ill.—Two four-cylinder Moline cars: one each touring and roadster.

Moon Motor Car Co., St. Louis, Mo.—Three four-cylinder Moon touring cars; one chassis.

Motor Car Mfg. Co., Indianapolis, Ind.—Two four-cylinder Pathfinder cars: one each touring and roadster; one chassis.

National Motor Vehicle Co., Indianapolis, Ind.—Four four-cylinder National cars: two touring and one each limousine and roadster; one chassis.

Nordyke & Marmon Co., Indianapolis, Ind.—Two Marmon cars: one each four- and six-cylinder touring; one six-cylinder chassis.

Norwalk Motor Car Co., Martinsburg, Va.—Two six-cylinder Norwalk touring cars.

Ohio Electric Car Co., Toledo, Ohio—Three Ohio electric broughams; one chassis.*

Oakland Motor Car Co., Pontiac, Mich.—Four Oakland cars: two four-cylinder touring cars and one coupe and one six-cylinder touring car.

Olds Motor Works, Lansing, Mich.—Four Oldsmobiles: two each four- and six-cylinder touring cars.

Packard Motor Car Co., Detroit, Mich.—Four six-cylinder Packard cars: two touring and one each limousine and cabette.

Paige-Detroit Motor Car Co., Detroit, Mich.—Five four-cylinder Paige-Detroit cars: two each coupe and touring and one roadster.

Peerless Motor Car Co., Cleveland, Ohio—Three six-cylinder Peerless cars: one each limousine, double limousine and touring; one chassis.

Pierce-Arrow Motor Car Co., Buffalo, N. Y.—Three six-cylinder Pierce-Arrow cars: two limousines and one touring car; one chassis.

Pope Mfg. Co., Hartford, Conn.—Five Pope-Hartford cars: one each four-cylinder roadster, coupe and touring and one each six-cylinder touring and limousine.

Premier Motor Mfg. Co., Indianapolis, Ind.—Four six-cylinder Premier cars: two touring and one each roadster and landaulet.

Pullman Motor Car Co., York, Pa.—Four Pullman cars: two four-cylinder touring, one four-cylinder roadster and one six-cylinder touring.

Rauch & Lang Carriage Co., Cleveland, O.—Four Rauch & Lang electric broughams.*

Truck Guarantees in Book Form.

As a matter of convenience, the N. A. A. M. has arranged to have its recently adopted standard motor truck warranty lithographed and bound in board covers, after the manner of bank check books, with stubs to be filled in with truck numbers, dates, and so on. The name of the company issuing the guarantee will be lithographed at the head of the form. With a view to encouraging the use of the standard warranty, which limits the guarantee period to 90 days, truck manufacturers who are not members of the N. A. A. M. will be supplied with the books of forms. The price charged will be only sufficient to cover the cost of production and will be lower than an individual company could obtain for similar work. The form measures 12½ inches long, including the stub, and 7¼ inches wide, and is lithographed in banknote green on heavy, durable paper.

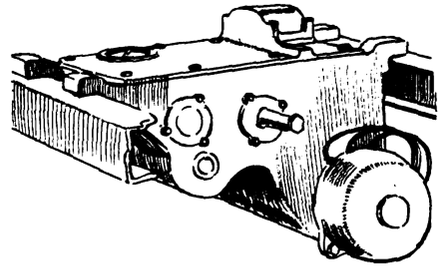
MANY NEW ACCESSORIES CROP OUT IN CHICAGO

Despite the Shortened List, Fair Assortment of Wares Not Previously Displayed Come to Surface as Usual—Warner Gearset-Starter Appears Though Other Heralded Devices Do Not—The Several Other Novelties Disclosed



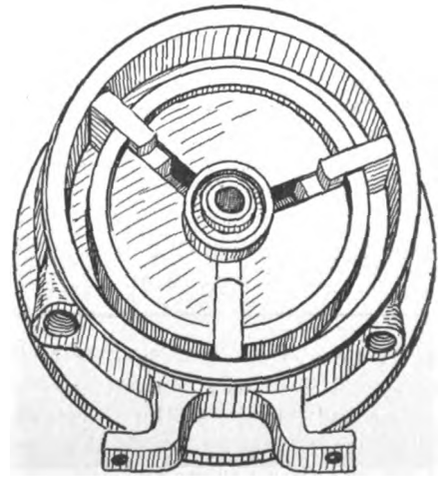
In the realm of motor starters, but little that is new and nothing that is startling turned up. The heralded combined lighting and starting systems of the Vesta Accumulator Co. did not put in an appearance, which is true also of the devices of the Briggs Magneto Co. and the Gould Storage Battery Co.

Warner Applies Starter to Gearset.

The promised starter of the Warner Mfg. Co., Toledo, Ohio, is in evidence, however, but, contrary to expectations, instead of being a motor starter, it is in reality a gearset incorporating the means of attachment of the starting unit of any of the well-known makes of electric starters now on the market. In its simplest aspect, the Warner device consists of a separate gear case formed as an integral part of the gearset case and in which are housed reduction gears and a ball clutch through which power to spin the motor is transmitted to the driving shaft. The starting motor, too, is adequately protected from the ingress of dirt or contact with articles calculated to work harm by a housing on the lower part of the gearset housing. The function of the ball clutch is to provide a flexible drive and, at the same time, to prevent injury to the starting motor in case of a backfire.

Rotary Air Motor in Thurber Starter.

The Thurber starter, made by the Thurber Rotary Starter Co., Detroit, Mich., is of the compressed air type, wherein air is compressed by a four-cylinder Kellogg pump driven from the motor and stored in a pressed steel tank against future use in starting the motor; the latter is accomplished through the intermediary of a rotary air motor which attaches directly to the motor crankshaft in place of the orthodox starting crank. The motor comprises a cylindrical body mounted eccentric with a casing in which it is free to rotate under the influence of air pressure exerted on a series of three vanes which radiate from it. The vanes are made slidable and are pressed against the walls of the casing by helical springs so that they always follow the contour of the cylinder walls and do not permit the leakage of the air. The air is admitted under a pressure of 200 pounds to the square inch at one end of the crescent-shaped chamber which is formed between the casing walls and the wall of the cylindrical rotor, and the pressure on the vane causes the rotor to revolve and bring the second and third vanes successively into play; exhaust is accomplished through a second port positioned at the other end of the crescent-shaped chamber. Naturally the rotor is attached to the crankshaft and causes rotation of the latter; an automatic clutch disengages the motor from the



WARNER GEARSET AND STARTER

crankshaft when the engine takes up its cycle of operation.

Little Six in Continental Line.

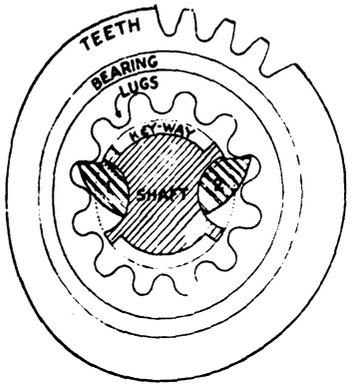
At the exhibit of the well-known Continental Motor Mfg. Co. of Detroit a brand new "little six" cropped up. It is a Continental motor through and through, which leaves but little to be said. It is of the L-head type with enclosed valve mechanism, pump circulation of the cooling medium and force feed lubrication; bore and stroke are

THURBER ROTARY AIR STARTER

3¾ and 5¼ inches, and it is rated nominally at 34 horsepower, although at 1,500 revolutions a minute, 48 horsepower is developed. The motor is designed for three-point suspension and use in connection with a unit power plant assembly and, by way of increasing the scope of application, it can be supplied for any reasonable drop from the supporting arms to the center of the crankshaft. The crank case is so designed as to permit the use of any make of engine starter or magneto, and it may also be stated that the motor is adaptable for use on cars on which either left or right control obtains. Where the transmission also is supplied, the use of a three- or four-speed gearset is optional with the purchaser.

Steering Gear With Double Bearing.

Besides a full line of Buda motors, which they exhibited as a matter of course, Brandenburg & Co., Chicago, displayed for the first time a line of Universal steering gears, made in Racine, Wis., by the Universal Mfg. Co. Features of the gears are the long, triple-thread worm made of vanadium steel, case hardened; bearings are ground and the worm is pressed on the shaft over two flattened Woodruff nickel steel heat-treated keys, eliminating all chance of its working loose. Provision is made for taking up all play which is likely to develop in the worm by an eccentric bushing fitted to the bearing in the malleable iron worm housing. The worm wheel is treated in the same manner as the worm and is ground to a fit with the worm. Both the eccentric bearing and the plain bearing in the housing are made of hard bronze and accurately fitted. Frictional controls, with levers of malleable iron and gears die cast, are fitted.



Wire Wheel With Wood Felloe Band.

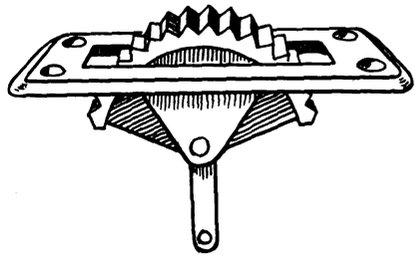
Of the very many wire wheels which have made their appearance at the present shows probably none is more interesting than the one exhibited at the booth of T. J. Lindsay, Indianapolis, Ind. However unheard of, the Lindsay wheel is by no means a new product, for Lindsay made his first wire wheel way back in 1902, as is attested by one of the original wheels which is on exhibition.

The Lindsay wheel is novel, not in the mode of attachment to the axle, that is not over-far removed from the orthodox, nor in the mode of lacing, for the spokes correspond with the radii of the wheel, but in the construction of the rim itself. The rim comprises, first, a steel felloe band into which the spoke heads are countersunk; over this is placed a wood rim which, in turn, supports the steel band for the reception of the demountable rim. The construction, it is claimed, has many advantages in the way of eliminating moisture and cushioning the shocks.

Digitized by Google

Of the several new things which came to the surface, none is newer or more radical than the Campbell gearset, exhibited by the Economy Equipping Co., of Chicago. The device is of the "gears-always-in-mesh" type and is innovative in that the use of dog clutches splined to the shaft is eliminated, their function being performed by "tilting keys"; the keys lie flush with the periphery of the shaft when the gears are not in driving engagement, but which can be so tilted as to contact with teeth cut internally on the gear wheel, causing rotation of the wheel in unison with the shaft at the proper time. The tilting of the keys is accomplished by means of a pair of helical springs after the keys have been shifted along the key seats and into position to engage the proper gear; the shifting is accomplished by means of a slotted collar and a yoke engaging with the change gear lever. The design permits of the entire mechanism being made very compact, and by virtue of the fact that the keys enter engagement with the internal lugs or teeth gradually, damage to either gearset, clutch or other part of the mechanism of the car is eliminated even when the gears are shifted without disengaging the clutch. By way of eliminating noise, one sliding gear is provided so that the lay shaft is caused to idle when high speed—direct drive—is in use.

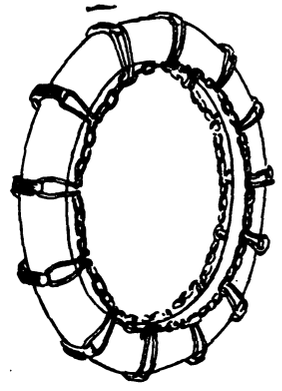
CAMPBELL TILTING KEYS



Another New Constant Mesh Gearset.

Also new in the transmission line is the three-speed selectively operated gearset produced by the Cotta Gear Mfg. Co., Rockford, Ill., itself a newcomer in the gearset manufacturing field and, just as the name of the new concern resembles the title of the older Rockford gearset maker — Cotta Transmission Co.—so does the product of the newcomer bear the earmarks of the older maker's product. In both instances the products are of the constant meshed gear type with power transmitted through the intermediary of dog clutches, which eliminates strain on the gear teeth and at the same time facilitates gear shifting. With the newer company's product springs have been eliminated from the assembly and double row ball bearings carry either end of both the driving and the lay shafts instead of the single row bearings which obtain in the Transmision Co.'s product; the latter, however, is provided with roller bearings on which the idler gears are mounted and which renders the product distinctive Naturally, the newer product is put out for use in connection with either shaft or chain drive vehicles and also in unit power plant form, and is arranged so as to be adaptable for either right- or left-hand or center control.

CAMPBELL ALL-IN-MESH GEARSET



Just a glimpse is to be had of the exterior of the long-promised new carburetter of the Imperial Brass Mfg. Co., Chicago; it is mounted on a board, but all information concerning its "inner works" was politely refused, although the device has been in the course of development for some two years. Other new devices in the Imperial line, however, are not concealed under bushel baskets and but little search reveals the Imperial Wixon accelerator, which is designed to eliminate all possibility of accident in case the foot throttle should be inadvertently stepped on. It comprises simply a section of a toothed wheel, of which but a slight portion protrudes through a slot in the plate which serves for a bearing.

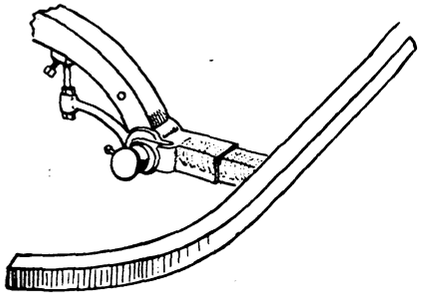
IMPERIAL WIXON ACCELERATOR

One new anti-skid device and a new mud hook are on view, made by the Perfection Non-Skid Climber Co., Edon, Ohio, and the Perkins-Campbell Co., Cincinnati, Ohio, respectively. The Non-Skid climber comprises a series of malleable iron pieces which stretch across the periphery of the tire in the same manner as the cross-chain members in an ordinary non-skid chain. The iron members are supported in position by side chains, to which they are attached by means of loops of heavy iron wire. Attachment and detachment are by means of a loose link in the outside chain; the device is made for both single and dual pneumatic tire equipment. The Perkins-Campbell mud hook comprises a malleable iron casing with a base piece formed to fit the curve of the tire, from which projects a short, corrugated baffle plate, which affords the gripping means. The device is strapped to the wheel by means of straps which pass through slots provided in the base; it is made in two sizes, to fit 4½-inch and 6-inch tires.

Exhibited for the first time, although it has been on the market for several months, is the Wotton automatic rectifier, made in Cleveland by the Electric Products Co. As its designation implies, the device is used in connection with the charging of electric vehicle batteries and, so used, eliminates the human factor from the operation, since the device, once started, consummates the charging operation without further attention.

PERFECTION CLIMBERS

In its simplest aspect, the device comprises an automatic cutout which serves to disconnect the battery from the charging circuit when the charging is complete, a regulator by means of which the charging rate can be varied within wide limits so as to permit of slow "soaking" or a very rapid charging, and an automatic regulator which cuts down the charging current as the battery approaches the charged state—a charging condition which is necessary when lead plate batteries are being dealt with. As for the rectifier itself—for the device is for use on alternating current—that is nothing more nor less than a mercury arc rectifier of compact design. Indeed, compactness is the keynote of the whole design, for the device, which is intended primarily for private garage use, measures but 18 by 20 inches and stands five feet high. Starting involves only the insertion of the charging plug and the throwing of a switch.



Variety in Bumper Styles.

In the realm of bumpers, two are exhibited which may be classed as new or un-

Digitized by Google

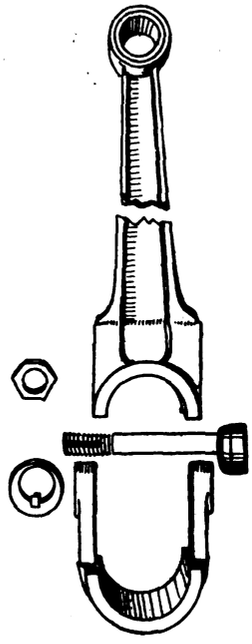
usual, one by the L. P. Halladay Co., Streator, Ill., and the other by the Wm. E. Pratt Mfg. Co., of Chicago. The Halladay device comprises a very heavy bar of channel cross section—steel, of course. Attachment is by means of clamps drilled for the reception of the spring shackle bolts and a bolted-on clamp which attaches to the lower flange of the frame side member; this latter clamp is made adjustable by means of a set screw so that the bumper bar can be raised or lowered at will, the clamps pivoting around the shackle bolt. The springs are helical, of square cross section, and are enclosed in rectangular telescoping tubes to the elimination of moisture and dirt calculated to work a negative effect.

Radically different is the Pratt bumper, which comprises a round ba rsupported by two single-leaf "S" springs, the lower ends

NEW HALLADAY BUMPER

of which attach to the front ends of the frame members by means of screw clamps. Obviously no shock, no matter how heavy, could possibly injure the bumper, for the spring simply would double up, so to speak, only to straighten out again when the depressing object was removed. Attachment involves the use of a monkey wrench only as a matter of but a few moments. The device is made either in malleable iron or in brass.

Bearings That Are Adjustable.



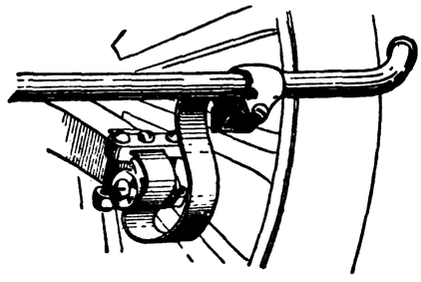
The U. S. Ball Bearing Mfg. Co., Oak Park, Ill., has on view a complete line of both single and double row ball bearings embracing the use of a new type of separator, permitting of the use of a sufficient number of balls to utilize 95 per cent. of the available ball space. The race ways as well as the retainers are made of Krefeld street, high in both carbon and chromium, and Hoffman balls are supplied.

Also new in the bearing line is the adjustable bearing of the Chicago Drop Forge & Foundry Co., which embraces the use of two brasses bolted together with a single bolt which passes through eccentric bushes. Turning the bushes accounts for all wear, and when the bolt is again tightened it locks both bushes and brasses, preserving the newer relation. The use of shims thus is eliminated.

A new combination comprising a lifting jack, a turntable, a tire rest and a transporting truck appeared in the Weaver Auto-Twin jack shown by the Weaver Mfg. Co., Springfield, Ill. The jack—in reality a pair of jacks operated together by the turning of a handle—is mounted on a three-cornered truck mounted on castors. Positioning the jack under the axle and turning the handle until the wheels are clear of the floor permits of the car being turned in a very short radius. The jack is made of the best of materials throughout.

Tool That Loosens Frozen Tires.

Another interesting contrivance which came to light is the Morris tire tool, shown by the Wm. E. Pratt Mfg. Co. In its simplest aspect the device is formed of a hook



CHICAGO ADJUSTABLE BEARING

intended to clasp the wheel rim, a guide clamp and a lever adjustable with relation to the hook—that is, the hook is provided with a series of indentures, into any one of which the pin which forms the lever fulcrum can be placed so that the compass of the device includes all of the more common sizes of tires. In use, the tool is adjusted with the hook gripping the rim, and the lever operating on the tire bead; the guide piece eliminates slipping. It is claimed that the tool will quickly loosen tires, although frozen to the rim, and do so without injury to either the rim or to the tire. The device is made of malleable iron and is black enameled.

A suit case or package carrier of very simple design adds to the newness of the L. P. Halladay Co.'s display. The device comprises two upright arms, one of which is slidable on a horizontal arm cast integral with the other. Straps connect the tops of the two arms and provision is made by means of a screw clamp for fastening the carrier to the running board. The cases are placed between the arms of a pair of the brackets which are fastened to the board of the car and strapped firmly in place.

The Scarborough Co., an Indianapolis concern, is showing the Auto-Compact tent, which is designed to attach to the top of the car, the shape being preserved by guy ropes fastened to pegs driven in the ground. The tent is designed with a view toward rapir erection, and it is claimed that it is waterproof and by virtue of the canvas flooring that is provided, proof against the entrance of vermin. Folded, the tent complete measures but 7 by 20 inches.

Among the other unlisted exhibits was Herroline, which the maker, the Improved Gasolene & Oil Co., of Chicago, claims is nothing more than gasolene, but gasolene

PRATT SPRING BUMPER

which has, by virtue of exhaustive chemical treatment, acquired virtues with which the ordinary gasolene is not blessed. Added to the ordinary fuel in the proportion of three ounces to five gallons, it is claimed that the Herroline will increase the "going qualities" of the gasolene fully 50 per cent. without working negatively on the motor mechanism; besides which it is claimed the addition of Herroline to the gasolene eliminates danger in handling the fuel, since it renders the combination considerably less volitile than the untreated fuel, and at the same time it tends to reduce carbon deposit.

Wafers for Slipping Brakes.

Displayed along with other Rex products —polishes, soaps and leather dressing—the Armiger Chemical Co., a Chicago concern has a new product, anti-slip brake wafers. The wafers are composed of a hard belt dressing and when rubbed on the braking surface cause the brakes to grip despite their condition due to the presence of oil, grease or water. Naturally, the dressing is applicable to fan belts also, to cure similar evils.

In the leather goods line, a new driving gauntlet is exhibited by the Morrison-Ricker Co., maker of Grinnell gloves. By virtue of a special stitching across the

Digitized by Google

palm, a series of serrations or corrugations is produced which it is claimed go far toward eliminating slipping of the wheel under the grasp.

The Perkins-Campbell Co., Cincinnati, Ohio, has on view a leather spark plug case for the accommodation of six plugs, which is sufficiently solid for the protection of the plugs from injury and yet sufficiently flexible to preclude all chance of cracking. Naturally, leather that is absolutely waterproof enters into the construction. Straps for all purposes and a complete line of leather covers for magnetos also are included in the exhibit.

THE 177 ACCESSORY DEALERS AND WHAT THEY DISPLAY

* Denotes not shown in New York; † denotes will remain second week.

A. S. K. Co., Cincinnati, Ohio—Polishes.*

Ajax-Grieb Rubber Co., New York City—Ajax tires.†

American Ball Bearing Co., Cleveland, Ohio—American axles and worm gearing.†

American Bronze Co., Berwyn, Pa.—Non-Gran bearing metal.†

Armiger Chemical Co., Chicago, Ill.—Polishes.*

Arnold, N. B., Brooklyn, N. Y.—Slikup cleaning specialties.

Auto Parts Co., Chicago, Ill.—Parts.*†

Auto Parts Mfg. Co., Muncie, Ind.—B-T-K gearsets, clutches, steering gears and levers.

Automatic Motor and Engineering Co., Chicago, Ill.—Church pneumatic system.*†

Automobile Supply Mfg. Co., Brooklyn, N. Y.—Newtone, Electra and Rubes horns.

Badger Brass Mfg. Co., Kenosha, Wis.—Solar lamps.†

Baldwin Chain & Mfg. Co., Worcester, Mass.—Baldwin chains.†

Baldwin Steel Co., New York City—Baldwin steels.†

Barco Brass & Joint Co., Chicago, Ill.—Exhaust horns, cut-out valves, pedals.*

Batavia Rubber Co., Batavia, N. Y.—Batavia tires.

Berg Auto Trunk & Specialty Co., New York City—Berg trunks and carriers.

Blackledge Mfg. Co., John W., Chicago, Ill.—Velvet auxiliary springs.

Bower Roller Bearing Co., Detroit, Mich.—Bower roller bearings.†

Bowser & Co., S. F., Fort Wayne, Ind.—Fuel pump and storage systems.†

Brandenburg & Co., Chicago, Ill.—Buda motors and Universal steering gears.*

Breakstone, S., Chicago, Ill.—Watch Dog lever locks and Hopewell tire cases.*

Briggs Magneto Co., Elkhart, Ind.—Briggs magnetos, lighting and starting systems.†

Brown Co., Syracuse, N. Y.—B'Co. pumps and specialties.

Brown-Lipe Gear Co., Syracuse, N. Y.—Brown-Lipe gears and gearsets.†

Byrne, Kingston & Co., Kokomo, Ind.—Kingston carburetters.†

B. & L. Auto Lamp Co., New York City—B. & L. lamps and fittings.

Champion Ignition Co., Flint, Mich.—A-C spark plugs.†

Chicago Drop Forge & Foundry Co., Chicago, Ill.—Drop forgings.†

Coes Wrench Co., Worcester, Mass.—Wrenches.

Connecticut Telephone & Electric Co., Meriden, Conn.—Connecticut shock absorbers, magnetos and ignition devices.

Continental Motor Mfg. Co., Muskegon, Mich.—Continental motors.*†

Cook's Sons, Adam, New York City—Albany grease and lubricating oils.

Cotta Gear Co., Rockford, Ill.—Cotta transmissions.*

Cotta Transmission Co., Rockford, Ill.—Gearsets.†

Cowles & Co., C., New Haven, Conn.—Lamps, heaters and body fittings.

Cramp & Sons Ship & Engine Bldg. Co., Wm., Philadelphia, Pa.—Parsons's white brass and bronze bearing metals, bearings and worm gears.†

Dayton Rubber Mfg. Co., Dayton, Ohio—Dayton airless tires.

Daniels, Smalley, Detroit, Mich.—New Era tires, tubes, springs and Mitchell metal parts and Sly accessories.

Dean Electric Co., Elyria, Ohio—Tuto and Rexo signals, Dynalux electric lighting systems, Otho and Elyria-Dean electric lighting and starting systems, Elyria-Dean speedometers, Hi-Fre-Co ignition systems.

Detroit, Lubricator Co., Detroit, Mich.—Lubricators.*

Detroit Electrical Appliance Co., Detroit, Mich.—Deaco electric lighting systems.

Diamond Chain & Mfg. Co., Indianapolis, Ind.—Diamond chains.†

Diamond Rubber Co., Akron, Ohio—Diamond tires.†

Dixon Crucible Co., Jos., Jersey City, N. J.—Graphite lubricants.†

Doehler Die Casting Co., Brooklyn, N. Y.—Die cast parts.

Double Fabric Tire, Co., Auburn, Ind.—Tires and inner tubes.

Dykes Co., John L., Chicago, Ill.—Tire protectors.

E-C Sales Co., Chicago, Ill.—Axles, demountable wheels, tire holders, etc.*

Eavenson Sons, Inc., J., Camden, N. J.—Jesco soaps and polishes.

Economy Equipping Co., Chicago, Ill.—Campbell gearsets.*†

Edelmann & Co., E., Chicago, Ill.—Tire gauges, valves, etc.

Edison Storage Battery Co., West Orange, N. J.—Edison batteries.*†

Electric Auto Lite Co., Toledo, Ohio—Auto-Liter lighting and starting systems.

Electric Products Co., Chicago, Ill.—Wotton automatic rectifiers.*

Empire Tire Co., Trenton, N. J.—Empire tires.†

Edmunds & Jones Mfg. Co., Detroit, Mich.—Lamps.†

Endurance Tire & Rubber Co., New York City—Endurance red inner tubes.

Electric Storage Battery Co., Philadelphia, Pa.—Exide storage batteries.†

Esterline Co., Lafayette, Ind.—Berdon electric lighting and starting system.†

Federal Rubber Mfg. Co., Milwaukee, Wis.—Federal tires.

Findeisen & Kropf Mfg. Co., Chicago, Ill.—Rayfield carburetters.†

Firestone Tire & Rubber Co., Akron, Ohio—Firestone tires.†

Fisk Rubber Co., Chicopee Falls, Mass.—Fisk tires.†

Gabriel Horn Mfg. Co., Cleveland, Ohio—Gabriel horns and rebound snubbers.†

Garage Equipment Mfg. Co., Milwaukee, Wis.—Hercules and Simplex pumpers and tire holders. Electrabola lamps and Gemco specialties.†

Gemmer Mfg. Co. ,Detroit, Mich.—Gemmer steering gears.†

Gibney Rubber Co., J. L., Philadelphia, Pa.—Tires and vulcanizers.†

Globe Machine & Stamping Co., Cleveland, Ohio—Steel tool boxes, metal hampers, fenders and sheet metal parts.†

Goodrich Co., B. F., Akron, Ohio—Goodrich tires.†

Goodyear Tire & Rubber Co., Akron, Ohio—Goodyear tires.†

Gould Storage Battery Co., New York City—Gould batteries and Duplex lighting and ignition systems.†

Grant-Lees Mch. Co., Cleveland, Ohio—Gearsets.

Gray & Davis, Amesbury, Mass.—Lamps and electric starting and lighting systems.†

Ham Mfg. Co., C. T., Rochester, N. Y.—Lamps.*

Halladay Co., L. P., Streator, Ill.—Bumpers, levers, pedals, tire carriers, license brackets, etc., etc.

Harrow Spring Co., Kalamazoo, Mich.—Springs.*

Harris Oil Co., A. W., Providence, R. I.—Lubricants.†

Hartford Suspension Co., Jersey City, N. J.—Truffault-Hartford shock absorbers, Hartford electric starting and lighting systems and jacks and bumpers.†

Havoline Oil Co., New York City—Havoline lubricants.†

Hayes Mfg. Co., Detroit, Mich.—Metal bodies, tool boxes, running boards and sheet metal parts.

Hess Spring & Axle Co., Carthage, Ohio—Springs and axles.†

Heinze Electric Co., Lowell, Mass.—Magnetos and coils.†

Hoffecker Co., Boston, Mass.—Hoffecker Steady Hand speedometers.

Homo Co. of America, Philadelphia, Pa.—Homo carburetters.†

Hyatt Roller Bearing Co., Newark, N. J.—Hyatt flexible spiral steel roller bearings.†

Ignition Starter Co., Detroit, Mich.—Disco acetylene and electric starting and lighting systems.†

Illinois Tire Filler Co., Chicago, Ill.—Tire filler.*

Imperial Brass Mfg. Co., Chicago, Ill.—Carburetters and brass parts.*†

Improved Gasolene & Oil Co., Chicago, Ill.—Herroline gasolene improver.*

International Acheson Graphite Co., Niagara Falls, N. Y.—Oildag and Gredag lubricants.

International Metal Polish Co., New York City—Blue ribbon polishes.

J-M Shock Absorber Co., Philadelphia, Pa.—J-M shock absorbers.

Kelly-Springfield Tire Co., New York City—Kelly-Springfield tires.

Kent Mfg. Works, Atwater, Philadelphia, Pa.—Unisparker ignition systems and Monoplex horns.†

Kellogg Mfg. Co., Rochester, N. Y.—Hand and power pumps and air engine starters.

Kokomo Electric Co., Kokomo, Ind.—Kingston magnetos, coils and timers.†

K-W Ignition Co., Cleveland, Ohio—K-W magnetos and coils.

Leather Tire Goods Co., Niagara Falls, N. Y.—Woodworth tire treads, Kant Skid tire bands, repair boots, etc.

Lee Tire & Rubber Co., Conshohocken, Pa.—Lee and Leland tires and Waymaker exhaust horns.

Lefever Arms Co., Syracuse, N. Y.—Gearsets.†

Lindsay, T. J., Indianapolis, Ind.—Rear axles and wire wheels.*

Link Belt Co., Philadelphia, Pa.—Silent chains.†

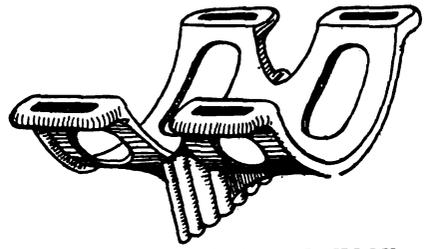
Longdin-Brugger Co., Fond du Lac, Wis.—Tops.*

Lovell-McConnell Mfg. Co., Newark, N. J.—Klaxon horns, Conover safeguards.

Lycoming Foundry & Mch. Co., Williamsport, Pa.—Lycoming-Mead motors.

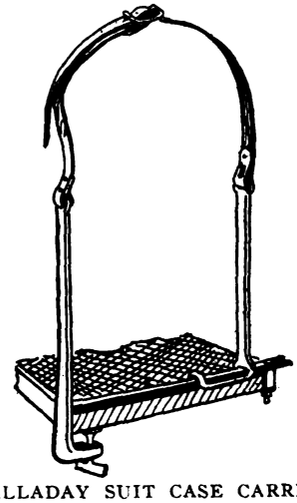
Marathon Tire & Rubber Co., Cuyahoga Falls, Ohio—Marathon tires.

Marburg Bros., Inc., New York City—Mea magnetos, S. R. O. bearings.†



Mayo Mfg. Co., Chicago, Ill.—Pumps and gauges.

McCord Mfg. Co., Detroit, Mich.—Radiators, lubricators, fans and McKim gaskets.†



McCue Co., Buffalo, N. Y.—McCue axles and wire wheels.

Metal Stamping Co., Long Island City, N. Y.—Stampings.

PERKINS-CAMPBELL MUD HOOK

HALLADAY SUIT CASE CARRIER

AUTO-TWIN LIFTING JACK

MORRIS TIRE TOOL

Michelin Tire Co., Milltown, N. J.—Michelin tires.*

Model Gas Engine Works, Peru, Ind.—Model motors.†

Morrison-Ricker Mfg. Co., Grinnell, Ia.—Grinnell gloves.*

Mossberg, Frank, Attleboro, Mass.—Wrenches.

Motsinger Devices Mfg. Co., Pendleton, Ind.—Motsinger autosparkers and carburetters.†

Motometer Co., New York City—Motometer temperature indicators.

Motz Tire & Rubber Co., Akron, Ohio—Motz cushion tires.†

Muncie Gear Works, Muncie, Ind.—Gears, wheels and gearsets.†

National Coil Co., Lansing, Mich.—Spark coils.†

National Motor Supply Co., Cleveland, Ohio—National pumps and vulcanizers.

National Rubber Co., St. Louis, Mo.—Tire preservative and Kantleak fillers.

National Tube Co., Pittsburg, Pa.—Seamless steel tubing.†

New Jersey Car Spring & Rubber Co., Jersey City, N. J.—Carspring tires.

New Miller Carburetter Co., Indianapolis, Ind.—New Miller carburetters.†

New York & New Jersey Lubricants Co., New York City—Columbia lubricants.

New York Coil Co., New York City—Rhodes Union Spark systems and other ignition devices.

North East Electric Co., Rochester, N. Y.—North East electric lighting and starting systems.†

Northway Motor & Mfg. Co., Detroit, Mich.—Northway motors.†

Oliver Mfg. Co., Chicago. Ill.—Oliver and Sampson jacks.*†

Pantasote Co., New York City—Pantasote top and seat coverings.†

Peacock Co., Clarence H., New York City—Ames shock absorbers.

Pennsylvania Rubber Co., Jeannette, Pa.—Pennsylvania tires.†

Perkins-Campbell Co., Cincinnati, Ohio—Straps and license brackets, magneto covers and spark plug cases.*

Perfection Spring Co., Cleveland, Ohio—Krupp steel springs.†

Perfection Non-Skid Climber Co., Edon, Ohio—Anti-skid devices.*

Pittsfield Coil Co., Pittsfield, Mass.—Pittsfield magnetos, coils, etc.*†

Piel Co., G., Long Island City, N. Y.—Long horns and G-P muffler cut-outs.

Pratt Mfg. Co., Wm. E., Chicago, Ill.—Jackson bumpers and other parts.*†

Racine Mfg. Co., Racine, Wis.—Bodies.*

Racine Rubber Co., Racine, Wis.—Racine tires.*

Randall-Faichney Co., Boston, Mass.—Jericho and Jubilee exhaust horns, muffler cut-outs, B'Line grease guns, Jericho gas regulators, and other accessories.

Remy Electric Co., Anderson, Ind.—Remy magnetos, lighting and starting systems.†

Republic Rubber Co., Youngstown, Ohio—Republic tires.†

Rhineland Machine Works Co., New York City—Rhineland bearings.†

MONTREAL'S SECOND SHOW INCLUDES COMMERCIAL CARS

Drill Hall Overcrowded With the Exhibits of Forty-three Dealers—Accessory Exhibits Numerous.

Automobile shows "take" well in Montreal—that is, if the fact that two have been staged—independently, of course—in the Drill Hall within the short course of a month can be taken as a criterion. The last one, which was under the auspices of R. M. Jaffray, closed its doors on Saturday evening last, February 1st, having held sway for a full week. In contradistinction to the first show, which under the auspices of the Automobile Club of Canada occupied the building from January 4th to 11th, trucks also were exhibited at the second show. In all, there were 43 exhibitors of either vehicles or products which have to do with them.

The exhibitors were: Automobile Francaises, Albion Motor Car Co., Ltd., Arlington Bicycle Works, Brantford Motor Truck Co., J. B. Baillargeon, Baker Motor Vehicle Co., Bellerive Garage & Auto Co., A. Beaudry, J. C. Collette, Canadian Automatic Transfer Co., Canadian Motor & Supplies Co., Canadian Pneumatic Tool Co., J. P. Mitchell Co., Ltd., Canadian Fairbanks-Morse Co., Ltd., Chapman Double Ball Bearing Co., Ltd., Canadian Tire Filler Co., Canadian Tire Filler Co., De Vaux Motor Co., Drednot Motor Works Co., Ltd., Franco-American Automobile Co., Frigon & Baker, Gareau Motor Car Co., International Harvester Co., Paul Lair, Victor Levesque, La Cie de Laiterie St. Laurient, E. Major, Maratime Motor Car Co., Ltd., Motors Transport, Ltd., Nicole, Nicolson & Co., Norwalk Motor Car Co., Wm. J. O'Leary, Arthur Pelletier, R E. T. Pringle, Pope-Hartford Motor Co., Paige Motor Car Sales Co., P. A. D. Robert, Royal Automobile Co., Fred E. Ritchie, E. Rivet, Republic Motor Car Co., Rosseau Bros., Ltd., Stockwell Motor Co., Solomon & Spielman, Universal Electric Economy Co., Weed Chain Tire Grip Co.

Thirty-five Dealers Display at Scranton.

Thirty-five dealers who displayed 39 different makes of automobiles in the evergreen and vari-colored bunting bedecked drill hall of the Scranton Armory comprised the third annual show of the Scranton Automobile Board of Trade, which held forth in the Pennsylvania city until Saturday last, February 1st; the doors opened on the exhibit Monday evening, January 27th. As is the case with many of the smaller shows, accessory dealers were not over-abundant, but motorcycle dealers were very much in evidence. The cars exhibited were:

Hudson, Studebaker, Cadillac, Maxwell, Hupmobile, Ford, Standard Electricque, Locomobile, Stevens-Duryea, Overland, Chase, Rambler, Stanley, Jackson, Mack truck, Franklin, Winton, Buick, Alco, Krit, Apperson, Haynes, Bowman, Kitsee, Pierce-Arrow, Autocar, Palmer-Singer, Little, Abbott-Detroit, Pope-Hartford, Marion, Cole, Chalmers, Packard, Oakland, White, Paige-Detroit, Michigan and Mercer.

Three Buildings for Rochester's Show.

Three buildings—all situated in Exposition Park and inter-connected—were necessary to house Rochester's fifth annual show, which closed its doors Saturday evening last, February 1st, having been in full swing since the evening of the Monday preceding. And despite the number and the size of the buildings there was scarcely floor space enough properly to care for the 112 exhibitors, 40 of whom displayed vehicles of one make or another, there being 60 different makes on the floor, and the other 72, accessories. As has been the case in other years, the show was under the management of the Rochester Automobile Dealers' Association.

Decorations were simple but effective, gold and blue being the colors which predominated in the draperies. Festoons of electric lights, the supports entwined with vari-colored streamers and studded with pennants, added greatly to the general effect.

Now, a "Jumping Contest" for Cyclecars.

Not satisfied with ordinary contests, foreign motorists—if the term may be applied to those who drive that peculiar type of vehicle styled "cyclecar"—have arranged a jumping contest to take place in the near future. The diminutive cars will be raced at a hump-backed bridge in an effort to better the record of a Frenchman who is credited with having jumped no less than 32 feet astride a motorcycle. Just what the contest will prove has not as yet, been explained.

Would Force Garages to Keep Records.

In an effort to prevent "joy riding" and to assist the recovery of stolen cars, Assemblyman Salus has introduced a bill into the New Jersey legislature which seeks to require garage owners to keep a record of the arrival and departure of all cars which enter their establishments, the records to be open for public inspection at all times. If enacted, violation of the law will be attended by a fine of $50.

TAFT STARTS CEREMONIES AT WASHINGTON SHOW

Presses the Button Which Throws Light Upon the 28 Cars Shown by 17 Dealers—Decorative Scheme Is Simple.

If an auspicious opening can bring success to an automobile show, then the exhibit which is holding the boards in Washington certainly should be successful, for it was opened by President Taft himself. Owing to a previous engagement, the President could not actually be present, but from the White House promptly at 8 o'clock Monday evening last, 3d inst., he sent the flash which caused the massive American flag to unfurl from the lofty ceiling of the Convention Hall and which at the same time set aglow the more than 1,500 electric lights which play no little part in the decorative scheme. The exhibition is staged by the Washington Automobile Dealers' Association.

In the matter of decorations, ivory, white, gold and green form the color scheme, and ceiling and walls are garbed in bunting and streamers so tinted. Booths are marked off with corner posts bearing electroliers and entwined with smilax and poinsettia; gold rope connects posts. The exhibits of the 17 motor car dealers who are showing embrace 28 different makes of both pleasure and commercial cars; accessories are shown by a dozen dealers.

The exhibitors are: Knox Motor Co., Knox and Winton; White Automobile Co., White and Universal and G. M. C. trucks; A. Loffler Co., Speedwell, Regal, Commerce, Lippard-Stewart truck; John H. Earle Co., Oakland; Norwalk Motor Car Co., Norwalk; Miller Co., Stutz; G. R. Cowie Co., Cole; Locomobile Co. of America, Locomobile; Emerson & Orme, Apperson and Detroit electric; Michigan Motor Co., Michigan; Henderson-Rowe Auto Co., Chevrolet, Little and Pullman; Potomac Motor Car Co., Marmon, and Woods electric; Matheson Motor Co., Premier and Henderson; Washington Auto Service Co., Hupmobile; Berryman & Williams, Pathfinder; Frederick Newburgh, Moon; Congressional Garl age, Wilcox trucks.

English Humor Applied to Lamps.

In the production of powerful head lamps—or can it be powerful humor?—American makers have nothing on their British cousins. "Two H. P. lamps" is the way one British car manufacturer lists an "extra" in his catalog. But the H. P. stands neither for high pressure, nor hocus pocus, nor just plain horsepower; it stands for high power!

THE TRUCKS THAT WILL BE "CATHEDRALIZED"

Chicago's Show of Commercial Vehicles Promises to Accentuate Standardization Revealed in New York—Score of Trucks Reserved for Display in West—Increase in the Light Weight Ranks.

All that the motor truck people of New York are wishing the motor truck people of Chicago is that the automobile show, Part II—which, being interpreted, means the commercial vehicle show—may be no less satisfactory than the recent week-long function that divided itself up between Good Old Madison Square Garden and the—well, young and more majestic Grand Central Palace. And behind the wish is the lurking suspicion that there's not likely to be any thing the matter with the Chicago truck show, thank you, if for no other reason than that about all of the big Eastern exhibits will be there, bag and baggage, as well as a score that did not deign to cast their shadows on the soil of the Skyscraper City.

Business That Follows Pleasure.

Of course, this is in line with Chicago's propensity for doing things on a large scale. Incidentally, it would be highly unorthodox to permit the present occasion to slip into the shadows of the past without making some reference to the aforesaid propensity; so be it chronicled that, though there were no swattable insects on New York's truck show, the city of strenuous zephyrs will make a better showing by five exhibits, for while there were 64 in New York there will be 69 in Chicago, including the 20 that did not come out of the West to New York.

On Monday, February 10, when all the pleasure exhibits have been cleared away, and the "working classes" have settled solidly into their places, the various and multifarious doors of the Coliseum, the Coliseum Annex, the Wilson Building—which is about as big as the Annex and is made practically part of it, for the time being, by means of a covered passage—and the First Regiment Armory will be thrown open—no one ever heard of doors being opened in any way except by being "thrown"—and will keep on opening and closing more or less continuously until the following Saturday.

Chicago's Score of "Exclusives."

Of the 20 exhibitors who were not at the New York show, the majority will display machines that partake of the general tendency toward standardization, while the exceptions are for the most part familiar types that have "made good" on the road. The Diamond T people, whose line embraces machines ranging in capacity from 1½ to 5 tons, have brought out their smallest machine with a worm drive. The advantages accruing from the application of power to all four wheels are strongly and practically urged by the Four-Wheel Drive company, whose machines have been put through that test of tests—the army maneuvers—and emerged covered with mud and glory. A new offering made by an old consern is the Urban electric, built by the Kentucky Wagon Co., along the most approved lines and ready, notwithstanding its newness, to roll right into service with the best of them. Just what will be the features of the Buffalo electric exhibit is a matter that has not yet been elucidated, and it remains for the opening of the show to make the revelation—a condition of affairs that adds interest by arousing curiosity and expectation. Still another electric, and one that is built along unusual lines, is the Walker, the internal driving system of which is by no means unfamiliar and is not changed in any material respect.

TRUCKS TO BE EXHIBITED IN CHICAGO, FEBRUARY 10-15

Not Exhibited in New York.

Adams	Mogul
Avery	Mercury
Buffalo Elec	Natco
Clark	Old Reliable
Commerce	Poyer
Diamond T	Reliance

Knox	Studebaker
Koehler	Universal
Krebs	Velie
Lauth-Juergens	Waverley Elec
	White

Little Fellows and Big Ones.

The Chicago "exclusives" include a number of makers who confine their attention to machines of the smaller types, from two tons capacity downward. The Adams, the Clark, the Ideal, the Natco—all are machines of popular sizes, built along more or less standard lines, each, however, with individual features and details that go far in helping a prospective purchaser to make up his mind. Among the light machines that are more or less different in general design from conventional types are the Commerce, which has friction drive, and the Little Giant and Mercury, which possess the simplicity that goes with the employment of a horizontal motor with two opposed cylinders. Among the big ones, ranging up to five and six tons, are the Avery, Harder, Old Reliable, Reliance, U. S., and Mogul—the latter, however, the only one of the "exclusives" to pass the five-ton mark and build a six-ton truck. The Poyer and Ware complete the list of a score of machines that for the most part are more or less familiar.

"Queer Things" Conspicuously Absent.

With the practical transplantation of the New York show to Chicago, it goes without saying that the main characteristics of the two exhibitions will be alike. The strides that have been made in the elimination of undesirable and impracticable methods of construction and the adoption of features that have survived the trials of time and service — in other words, standardization of design—will be as evident in one place as the other, and the absence of the queer things for which the Chicago show used to be more or less famous—which wasn't the fault of anyone except those who concocted the freaks— will be regretted by no one except perhaps some who look in out of idle curiosity, and they don't count much at an exhibition of commercial vehicles.

Summary of Trucks To Be Exhibited.

Adams Bros., Findlay, Ohio. Adams. Gasolene, 1 and 1½ tons; prices, $2,100 and $2,300.*

Digitized by Google

American Locomotive Co., New York. Alco. Gasolene, 2 to 6½ tons; prices, $2,950 to $5,200.

Autocar Co., Ardmore, Pa. Autocar. Gasolene, 3,000 pounds; price, $2,150.

Avery Co., Peoria, Ill. Avery. Gasolene, 2, 3 and 5 tons; prices, $2,700 to $4,500.*††

Baker Motor Vehicle Co., Cleveland, Ohio. Baker. Electric, 500 pounds to 4 tons; prices, $1,800 to $3,500.††

Bessemer Motor Truck Co., Grove City, Pa. Bessemer. Gasolene, 1,000 to 3,000 pounds; prices, $1,200 to $2,700.††

Blair Mfg. Co., Newark, N. J. Blair. Gasolene, 1½ to 3½ tons; prices, $3,000 to $3,750.†

Bowling Green Motor Car Co., Bowling Green, Ohio. Modern. Gasolene, 1,000 to 2,000 pounds; prices, $1,200 to $1,600.†

Brown Commercial Car Co., Peru, Ind. Brown. Gasolene, 500 pounds; price, $1,650.††

Buffalo Electric Vehicle Co., Buffalo, N. Y. Buffalo. Electric.*

Chase Motor Truck Co., Syracuse, N. Y. Chase. Gasolene, 500 pounds to 2 tons; prices, $500 to $2,200.†

Clark Delivery Car Co., Chicago, Ill. Clark. Gasolene, 1 ton; price, $2,000.*

Chicago Pneumatic Tool Co., Chicago, Ill. Little Giant. Gasolene, 1 ton; price, $1,100.*††

Commerce Motor Car Co., Detroit, Mich. Commerce. Gasolene, 1,000 pounds; price, $700.*††

Dart Mfg. Co., Waterloo, Ia. Dart. Gasolene, 750 to 3,000 pounds; prices, $750 to $1,790.†

Diamond T Motor Car Co., Chicago, Ill. Diamond T. Gasolene, 1½, 3 and 5 tons; prices, from $2,250 to $3,500.*†

Dayton Auto Truck Co., Dayton, Ohio. Dayton. Gasolene, 2, 3 and 5 tons; prices, $2,600 to $4,500.*

Durant Dort Carriage Co., Flint, Mich. Flint. Gasolene, 1,000 and 1,600 pounds; price of 1,0000 pound, $875.

Federal Motor Truck Co., Detroit, Mich. Federal. Gasolene, 1 ton; price, $1,800.

Four Wheel Drive Auto Co., Clintonville, Wis. Gasolene.*††

Garford Co., Elyria, Ohio. Garford. Gasolene, 1½ to 5 tons.

General Motors Truck Co., Pontiac, Mich. G M C. Electric and gasolene, electric 1,000 pounds to 6 tons and gasolene 1¼ to 5 tons.

General Vehicle Co., Long Island City, N. Y. General Vehicle. Electric, 750 pounds to 5 tons. ††

Gramm Motor Truck Co., Lima, Ohio. Gramm. Gasolene.

Gramm-Bernstein Co., Lima, Ohio. B. A. Gramm. Gasolene, 2 to 3½ tons; prices, $2,750 to $3,600.††

Harder Auto Truck Co., Chicago, Ill. Harder. Gasolene.*†

Harwood-Barley Mfg. Co., Marion, Ind. Indiana. Gasolene, 1½ tons; price, $2,000.*††

Ideal Automobile Co., Ft. Wayne, Ind. Ideal. Gasolene, ¾, 1, 1½ and 2 tons; prices from $1,500 to $2,250.*†

Hewitt Motor Co., New York. Hewitt. Gasolene, 1 to 10 tons; prices, $1,800 to $5,500.

Hupp Motor Car Co., Detroit, Mich. Hupmobile Gasolene, 800 pounds; price, $950.

International Harvester Co., Chicago, Ill. I. H. C. Gasolene, 1,000 pounds.††

Kelly Motor Truck Co., Springfield, Ohio. Kelly-Springfield. Gasolene, 1 to 3 tons; prices, $2,000 and up.

Kentucky Wagon Mfg. Co., Louisville, Ky. Urban. Electric, 1,000 pounds; price, $1,800.*

Kissel Motor Car Co., Hartford, Wis. Kissel. Gasolene, 1,500 pounds to 5 tons; prices, $1,500 to $4,350.

Knox Automobile Co., Springfield, Mass. Knox. Gasolene, 2 to 6 tons; prices, $2,750 to $5,000.

Koehler S. G. Co., H. J., New York. Koehler. Gasolene, 1,600 pounds; price, $750.†

Krebs Commercial Car Co., Clyde, Ohio. Krebs. Gasolene, 1,500 pounds; price, $1,375.

Lauth-Juergens Motor Car Co., Fremont, Ohio. Lauth-Juergens. Gasolene, 1 to 3 tons; prices, $1,950 to $3,300.††

Lippard-Stewart Motor Car Co., Buffalo, N. Y. Lippard-Stewart. Gasolene, 1,500 pounds; price, $1,650.†

Locomobile Co. of America, Bridgeport, Conn. Locomobile. Gasolene, 5 tons; price, $4,800.

Lansden Co., Newark, N. J. Lansden. Electric, 750 pounds to 5 tons.†

Mack Bros. Motor Car Co., Allentown, Pa. Mack. Gasolene, 1 to 7 tons; prices, $2,100 and up.

Mais Motor Truck Co., Indianapolis, Ind. Mais. Gasolene, 1½ to 3 tons; prices, $2,750 to $3,400.

Mogul Motor Truck Co., Chicago, Ill. Mogul. Gasolene, 2, 4 and 6 tons; prices, $2,800 to $4,700.*††

Mercury Mfg. Co., Chicago, Ill. Mercury. Gasolene, 1,000 pounds; price, $750.*

National Motor Truck Co., Bay City, Mich. National. Gasolene, 1 ton.*††

Old Reliable Motor Truck Co., Chicago, Ill. Old Reliable. Gasolene, 2, 4 and 5 tons; prices from $2,750 to $4,500.*

Packard Motor Car Co., Detroit, Mich. Packard. Gasolene, 2 to 5 tons; prices, $2,800 to $4,500.††

Peerless Motor Car Co., Cleveland, Ohio. Peerless. Gasolene, 3 to 5 tons; prices, $3,700 to $4,500.

Poyer & Co., D. F., Menominee, Mich. Poyer. Gasolene.*††

Pierce-Arrow Motor Car Co., Buffalo, N. Y. Pierce-Arrow. Gasolene, 5 tons; price, $4,500.

Pope Mfg. Co., Hartford, Conn. Pope-Hartford. Gasolene, 3 to 5 tons; prices, $3,350 to $4,475.

Reliance Motor Truck Co., Pontiac, Mich. Reliance. Gasolene.*

Reo Motor Car Co., Lansing, Mich. Reo. Gasolene, 1,500 pounds to 2 tons; prices, $760 to $1,800.

Sanford Motor Truck Co., Syracuse, N. Y. Sanford. Gasolene, 1 ton; price, $1,600.††

Saurer Motor Co., New York. Saurer. Gasolene, 4½ to 6 tons.

Schacht Motor Car Co., Cincinnati, Ohio. Schacht. Gasolene, 1,500 pounds to 4 tons; prices, $1,600 to $3,300.††

Selden Motor Vehicle Co., Rochester, N. Y. Selden. Gasolene, 1 ton; price, $2,000.

Service Motor Car Co., Wabash, Ind. Service. Gasolene, 1,500 pounds to 1½ tons; prices, $1,350 to $1,675.†

Smith Co., A. O., Milwaukee, Wis. Smith-Milwaukee. Gasolene, 3½ to 6 tons.††

Speedwell Motor Car Co., Dayton, Ohio. Speedwell. Gasolene, 2 to 6 tons; prices, $3,750 to $4,400.

Standard Motor Truck Co., Detroit, Mich. Standard. Gasolene, 3 tons; price, $2,750.†

Sternberg Mfg. Co., Milwaukee, Wis. Sternberg. Gasolene, 2 to 5 tons; prices, $2,800 to $4,500.

Stewart Motor Corp., Buffalo, N. Y. Stewart. Gasolene, 1,500 pounds; price, $1,650.†

Studebaker Corp., Detroit, Mich. Studebaker. Electric and gasolene; electric, 500 pounds to 5 tons; gasolene, 800 pounds to 5 tons.

United States Motor Truck Co., Cincinnati, Ohio. United States. Gasolene, 2 and 3 tons; prices, $2,800 and $3,500.*

Universal Motor Truck Co., Detroit, Mich. Universal. Gasolene, 1 to 3 tons; prices, $2,750 to $3,400.†

Velie Motor Vehicle Co., Moline, Ill. Velie. Gasolene, 1,500 pounds to 3 tons; prices, $1,600 to $3,350.

Walker Vehicle Co., Chicago, Ill. Walker. Electric, ½ to 3½ tons.*

Ware Motor Vehicle Co., St. Paul, Minn. Ware.*††

Waverley Co., Indianapolis, Ind. Waverley. Electric, 600 pounds to 5 tons; prices, $1,800 to $4,000.

White Co., Cleveland, Ohio. White. Gasolene, 1,500 pounds to 5 tons; prices, $2,100 to $4,500.††

REILLY ADVISES MAN WHO IS "ABOVE HIS JOB"

Feeling Bigger Than One's Position is a Sure Way to be Smaller Than the Position—Convinces One of His Shop Men That Sweeping is Not Necessarily too Menial for a Machinist.

Loud voices, or, rather, a loud voice, penetrated the walls between the repair shop and Reilly's office and broke the train of thought which the dealer was having transcribed by the office girl as the answer to a letter from the Sales Manager, who had asked an opinion on a certain selling plan which had long been turning over and over in the factory man's mind. As the voice continued to intrude itself into the air of regularity and comparative quiet which characterizes a well managed establishment, Reilly ceased to dictate, saying, "You can write what you have; I'll be back in a minute."

He arose and was about to start for the shop, when the shop door opened and one of the shop men burst into the salesroom and then turned toward the office door; he evidently was considerably agitated, but endeavored to calm himself as much as possible as he entered the office.

Reilly Is Asked To Be a Judge.

"Mr. Reilly," he blurted out, "Williams fired me."

"Did he?" answered the dealer quietly, before the other had time to enlarge upon his difficulties with the foreman machinist. "What if he did?"

"I don't think he was justified, that's all," went on the mechanic, "and I wanted to ask you whether I'm right or wrong."

"What did he fire you for, Billy?"

"Because I didn't want to sweep the shop floor," asserted the man in overalls. "It may sound kiddish to you, but I don't believe it's my place to be a sweeper; I'm a machinist."

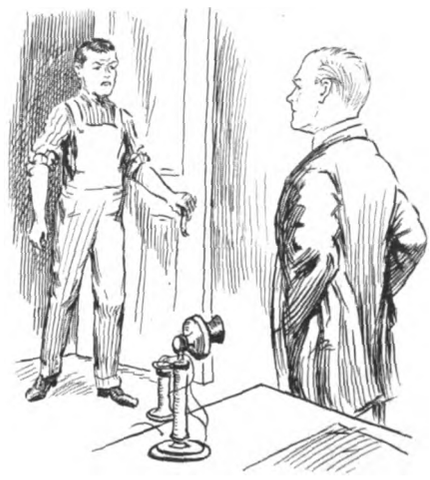
"I thought Williams had a boy out there who did such work as that," suggested Reilly.

"He has," declared Billy, "but the boy didn't show up to-day and Williams wanted me to sweep out."

"Someone has got to do it, hasn't he?" asked the dealer.

"I suppose so," was the admission.

"Whom do you think ought to do it?" was the next question.



"Well—" said the man with the grimy face and hands, and he got no further in his expression, for the simple reason that he did not know what to say next; and as the man hesitated Reilly began to smile in a peculiar, quiet way that made the belligerent realize that he was cornered in the argument.

"Sit down," invited Reilly, and the workman did so. "You and Williams ought to get along well together; he's pretty square and fair with the men, isn't he?"

Diagnosign the Workman's Case.

"I never made a kick before," exclaimed the shop man; "I have always called him the best foreman I ever had."

"Maybe you're to blame this time," hinted the dealer. "Did you ever stop to think that oftentimes a man has to do things that

"MR. REILLY, WILLIAMS FIRED ME," SAID THE SHOP MAN

don't just set well with him, but which nevertheless are a part of his job? Maybe you didn't, but I know you're man enough to see it when it's explained to you that a man who thinks he's too big for his job is in reality too small for the job. You're not exactly that way, but if you want my most honest opinion, given in as friendly a way as possible, I will say that I think you have shown a touch of that feeling this afternoon. You're not going to be offended, are you, if I talk to you like this?"

"No, sir," replied the workman, who really could make no other reply; but he also was the type of man who occasionally would admit that he was a suitable recipient for advice.

"I suppose, Billy, that you have often looked forward to the day when you would be a foreman machinist, or something better than an ordinary machinist; everyone does, or ought to. But if you analyze the make-ups of the men who have fairly won their way to foremen's positions you will find that most of them were the men who did not think their work was beneath them. A machine man may get it into his head that he is too good a man to be an ordinary machinist, and that therefore he ought to be a foreman machinist. Instead of proving that he is bigger than the machine job and thereby showing his fitness for the bigger position when the opportunity presents itself, he fails to handle the machine job to the best of his ability and is heading toward a goal which is the opposite of what he had in mind.

Sizing Up the Job and the Man.

"Take your own case to-day. The shop has to be swept and kept clean, and since it is work that an unskilled laborer can do, Williams keeps a boy for that work; but the work has to be done, and if the boy failed to show up you must be able to see yourself that someone had to do it. It's up to every man in the shop to be willing to keep the shop neat and clean and maintain a good standard, so someone other than the boy had to sweep to-day; isn't that so?"

"Yes, sir," rather meekly replied Billy.

"Now, then," added Reilly, "since there were nothing but machine men in the shop, either one of them or Williams had to sweep. Williams has too many other things to do, so one of the men had to do it; and why shouldn't you do it just as much as any of the others? You get just as much an hour, whether you're sweeping or working at your trade. If anyone loses its's myself; we can get a boy for not more than 15 cents an hour to sweep, and if you do it it costs about three times that."

"Maybe I was wrong," admitted the workman. "I'll admit I was hot-headed for a minute and didn't stop to think very much about it."

"I'll tell you, Billy," continued Reilly, "there's nothing that counts for so much as a willingness to do all that your job requires—and sometimes a little more. I know a newspaper man who, when he was younger than he is now was sent out of the

Digitized by Google

city where his paper was located to manage a little branch office. The morning he blew in he looked things over and saw at once that from being a reporter exclusively, as he had been in the city, he was going to be everything from manager to office boy in the new place. Do you know the first thing he did?"

"No," answered Billy.

"He hunted up a broom and swept the office and the whole front sidewalk," replied the dealer. "And he certainly looked out of place. Just imagine a man in patent leather shoes and the latest style of overcoat and hat acting as a porter! The point is that he really was out of place; he proved it by other things in the few months that followed, and it wasn't long before he got a bigger place.

Salesman Who Traveled Downward.

"I know a salesman for a shoe house who always will be a mere salesman, provided he doesn't get pushed down the ladder to a lesser position. One day he was at the home office when one of his customers wired in and asked that a certain size and style of shoe be rushed to him at once to fill an order for a particular customer who had to have the shoes at once, as seems to be the case with some people whenever they finally make up their minds they want anything. The customer had ordered a case, but asked that one pair be gotten to him as quickly as possible, by mail, special delivery or any other way. The expense didn't matter so much as did his holding the customer.

"Well, the salesman was going on a trip that night that led through this man's town and the office asked him if he would not be so accommodating as to take the shoes down to the customer. He refused point blank and wanted to know if he was a salesman or a messenger boy. He was in the place of a salesman but was qualifying himself for the position of messenger boy, or something not so high up. He could have made an everlasting impression upon that customer by delivering those shoes in person, but he passed up this valuable opportunity because he thought he was above such work."

"I never thought of it that way," reflectively commented the workman, and he started to go.

The Shop Man Who Became Boss.

"Wait! Don't be in a hurry," said Reilly. "I want to tell you about another man. He was a machine man, just the same as you are; he worked in an automobile repair shop, too, just the same as you do, and he was one of the best workmen his employer ever had. I knew him personally, and knew his employer, too. This man started in as an ordinary shop hand, but he was always looking about him to see if there was not some way he could better his work, or something he could do that would make him more valuable to his employer. He never watched the clock or got the idea that he had to look sharp for fear someone would ask him to do something that was not up to his standard, and he never, so far as I know, refused to do anything that he was asked to do.

Doing the Work You Are Paid To Do.

"Also, he never got it into his head that he was above being bossed. Some men, you know, get that way. They believe that they ought not to be told anything. I don't mean that bossiness is the right thing for a foreman, but there are times when a man has to be told things. How can he know what to do or how can his employer let him know what is to be done if the man won't be told?

—AND NOW REILLY STEPPED OUT AND CLOSED THE DOOR

"So long as a man is working for someone else he must necessarily do things now and then which he would rather not do, but he is being paid for doing those things, and if he doesn't want to do them the proper thing for him to do is to resign quietly and get another job. That shop hand got to be shop foreman after a while, but to this day he would just as soon sweep the shop as to do anything else—in fact, if I'm not mistaken, he does sweep out if it's necessary. I should think you'd like to work for him."

"I would," eagerly exclaimed Billy. "Where is he now?"

Sweeping Assumes Different Aspect.

"Come out and I'll introduce you to him," said Reilly, and he led the way to the shop.

As they opened the door they saw Williams busy with the broom. Billy couldn't stand it any longer. He marched straight up to the foreman machinist without waiting for an introduction from Reilly and took the broom into his own hands.

Reilly had stopped just inside the shop door to watch developments, and now he stepped out and shut it.

Silences Chauffeurs of Pittsburgh.

Pittsburgh may be smoky, but it isn't going to be as noisy as it was, at least so far as vociferous chauffeurs are concerned; heretofore a great many of them have been in the habit of shouting to the driver following when they wished to stop, slow down or turn a corner, instead of using the extended arm as a signal. The city fathers have grown weary of the clamor, and in a new ordinance which just went into effect incorporated a paragraph forbidding drivers to use such audible means of signifying their intention; hereafter they must "wig-wag" their intentions if they would elude the clutches of the law.

Adding More Room to Garford Plant.

Three new buildings are being added to the Garford plant in Elyria, O., the floor space of which thereby will be increased by nearly 40,000 square feet. The new structures consist of a warehouse, 60 x 300 feet, a rear axle assembly shop, 56 x 280 feet, and a four-story addition, 45 x 45 feet, to the main building. All will be of concrete construction to conform with the style of the present main building.

When Non-Skid Chains May Fail.

Too much dependence should not be placed upon chains to prevent sliding on a greasy road surface when brakes are applied, for the brakes may lock the wheels, or one of them, in such a position that the tire rests directly on the road between two cross-chains and is free to slide. Should this occur, the proper thing to do is to ease up on the brake and let the wheel turn a little until the chains grip.

To Make Tan Leather Turn Black.

As a simple and harmless means of permanently blackening tan leather, it is recommended that it be rubbed first with a 10 per cent. solution of tannic acid, which should be permitted to dry thoroughly. Afterward, a 10 per cent. solution of iron sulphate should be applied and in turn permitted to dry. Both chemicals are easily procurable at any drug store.

The accuracy of the machining of the valves of a well-known foreign car is tested by inserting the stem in a hole drilled in a steel block and letting the seating come down on a corresponding seating in the block. The gauge being absolutely accurate, any failure of the valve to seat properly indicates a fault.

BUILDING A FRONT WHEEL TO MEET AN EMERGENCY

Not a Handsome Job, But One That Answered the Purpose and Took the Car Home—How It Was Done.

All the trouble occurred on one of those mean little creek bridges—one of the kind that makes an obtuse angle with the road by which it is approached, being built straight across the water doubtless because it would cost an extra eleven dollars to build it on the skew and maintain a straight line with the road on either side. It was early in the morning, and cold, and the rain of the night before was ice on the planks, though the roads were in fairly good condition.

The car was going too fast. Had the bridge planks been dry it would have been all right, but as they were not, the car promptly executed a fancy lateral slide with the result that one of the front wheels was driven with a crash against the heavy timber railing. The timbers suffered but little, which was a matter of no particular importance; the thing that counted was that the wheel was wrecked—hopelessly wrecked. The mudguard was wrinkled considerably and a lamp collapsed with a tinkle of expensive glass—but the wheel was the serious part of the incident. It was utterly useless.

Forty-five miles from a new wheel, ten miles from a railroad station and half a mile from a village, and for various reasons it was necessary to get the car to the city that night. Obviously the first thing to do was to explore the village, which, being done, revealed nothing more hopeful than a combined blacksmith and carpenter shop.

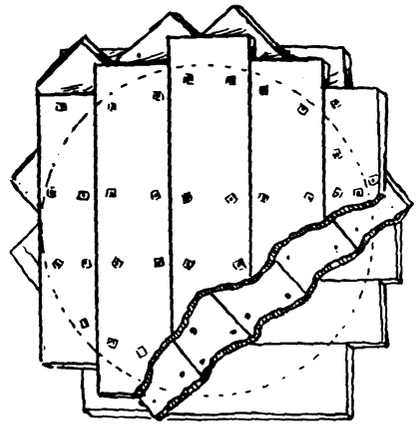
"Let's see that machine, anyway," suggested the carpenter.

He saw it.

"The wheel's gone," he announced, in the tone of one imparting news. "If you ain't too pertickler, though, I guess I could rig somethin' to git the machine home with."

No; nobody was "pertickler"—anything to get the machine home.

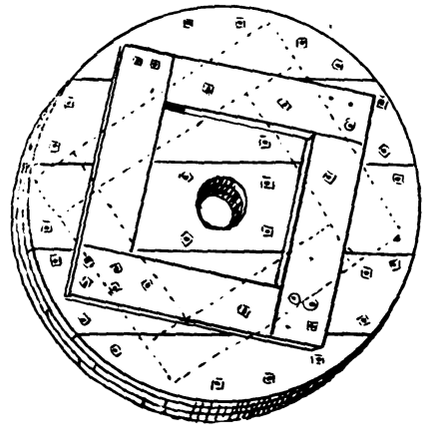
"Will that iron hub come off?"



It would and it did.

"Now, if you'll come back to the shop mebbe you can save a little time by helpin' me."

At the shop the outer flange of the hub was taken off and the remains of the wheel removed. So far as appearances were concerned, the hub was not bent to amount to anything. The carpenter rummaged out some ¼-inch oak lumber and gazed at it reflectively.



"It's a pity to use up that stuff," he remarked regretfully, "but I guess soft wood won't be no use." So he attacked the boards with a saw. "We'll build up a wheel that'll get you home somehow."

So a wheel was built up, and when it was finished it looked very much like one of

EMERGENCY WHEEL IN BUILDING

those ancient ox-cart wheels that they used in India or somewhere and that never was oiled, so that they squealed continuously—which has nothing to do with this story. A layer of short boards was laid down and a second layer on top of it, the second being placed at an angle of 45 degrees with the first and the two fastened together with a few nails. A third layer was added, at

WHEEL READY FOR SERVICE

right angles to the first, and screwed down. Thus there were three layers, with the grain running at different angles.

A circle was marked off just the diameter of the wheel, which happened to be 34 inches, and a second and smaller circle of the diameter of the barrel of the hub. The hole was cut out with a keyhole saw, and though it was something of a job because of the thickness of the wood and the hardness of the well-seasoned white oak, it was as nothing compared with the labor of cutting down to the big ring. Had there been a band-saw in the village the work could have been done in one-tenth of the time.

To hold the layers firmly together, a set of cleats was put on each side, each set forming a hollow square. The corners of the square on one side of the wheel—that's what it must be called, no matter what it looks like—did not come opposite the corners of the square on the opposite sides, but half way between; the accompanying illustrations make the arrangement plain enough. The whole imposing structure was firmly bound together by a lot of carriage bolts put clear through both sets of cleats where they crossed, and also through the boards inside and outside of the cleats. The bolts were driven into bored holes in which they were a tight fit, and washers were put under the heads and also under the nuts, which were pulled down hard and the ends of the bolts slightly riveted over.

A little paring and fitting was required to get the contrivance on the hub. Holes for the hub bolts were marked off with a pencil from both sides and the holes bored from both sides, the bit being sent half way through from each mark so that the bolts would come out opposite the places where they went in. It was rather a mean little job, and some of the holes were so kinked in the middle that it was necessary to resort to the use of a red-hot iron to make straight the paths for the bolts, which finally were worried into their places and pulled down hard.

"Naow!" said the carpenter, standing off a little with his head on one side admiring his handiwork. "Mebbe you'd like to have a coat of red paint put on that there—naow—wheel."

The offer was declined hastily and with thanks.

"Well, mebbe you're right; it don't match the other wheel none too good as it is, does it?"

Which it certainly didn't.

With a round stick through its center the wheel was trundled to the car, which stood on the bridge under a guard of small boys and the village drunkard. It went on all right, and once more the car stood on four wheels. It looked all right, too—from the other side. It was too bad, though, that the new contrivance was on the left side, where it was displayed in all its beauty to the occupants of the cars that were met, to say nothing of the many machines that overtook the "cripple" on the road. The journey of 45 miles was accomplished without incident and without breaking any speed laws, but it must be recorded that the obvious interest of other people along the line became somewhat cloying, in time. Beyond losing a few chips from its rim, the oak disk arrived at its destination in as good condition as it started, and—well, if anybody wants to buy a nice, substantial spare wheel, it's there yet.

Solutions of the Used Car Problem

In Competition for Motor World's Cash Premiums of $50, $25, $15 and $10 for the Best Four Articles Dealing With the Subject.

By H. G. CHADWICK, Boston, Mass.

The solution of each individual dealer's second-hand problem lies with himself, as a co-operative clearing house can not and will not prove successful until the retail automobile industry is placed on a more generally businesslike basis.

There are too many "weak sisters" engaged in the sale of automobiles at the present time and, until the process of elimination has weeded them out, the successful dealer who depends on good judgment and salesmanship for his profit will decline to enter into an association with those who cannot resist the temptation to sell a car at a fraction of their legitimate profits. There are too many ways in which, if he wants the order so badly as to be willing to sacrifice a good portion of his commission, he can evade any rules a clearing house association might formulate. "Buy my car, Mr. Prospect," he will say, "and I will give you a hundred, more or less, over what the clearing house gets for your car." This and many other methods of evasion will be his manner of following rules.

Those who are intent upon building up a profitable, permanent business should have little difficulty in handling the situation in a satisfactory manner.

One of the leading New England concerns (whose sales greatly outnumber those of other moderate price car agents) has a system which is followed religiously. Before a prospect's car is appraised, a trained salesman has a demonstration—turns buyer, and makes the owner show him the car's good points, while he has eyes and ears open for its bad features. Then a figure is named, which is based upon the condition of the power plant, tires, etc. An estimate of the expense necessary to put the car in a demonstrable and saleable condition enters into the proposition, and, most important of all, the standing of that particular make of car in the local market.

The unknown or unpopular car shrinks twice as rapidly in the first year's depreciation as the standard make, the manufacturer of which is financially sound and whose reputation is beyond reproach. As a rule, 40 per cent. depreciation for a car that has been run one season is the average, but some cars that are difficult to move bring as low as 40 per cent. of the original cost after only one year's use.

Often a deal is made in which a car of questionable value is traded in on a proposition whereby the owner gets all over a certain figure which the dealer allows outright, that figure being low enough to protect the dealer against much of a loss; but as a rule the transaction closes with an allowance which must be acceptable to the owner and which allows the agent a fair chance to get out whole and realize the full commission on the new car sale.

After the used car is received by the dealer, it is turned over to the second-hand car department, tuned up, thoroughly cleaned inside and out and made as presentable as possible. A cleaned power plant on which a little aluminum paint and lampblack has been used, together with polished brass, properly inflated tires and touched up enamel will work wonders toward creating "the desire to own" in the mind of the second-hand car prospect.

If the paint is in very poor condition, a small sum spent in that direction is usually well invested, and before showing a car to any prospect it should always be at its best and placed where it will show up to advantage. "Fine feathers make fine birds" and in the used car business a little painstaking attention to appearance brings out the truth of the saying, although some time must also be spent in putting the car in running condition.

As a rule we will find that the automobile dealer who curses the necessity of taking second-hand cars in trade is the one who tucks them away in the basement and allows them to become so shabby in appearance that it is almost impossible to secure anywhere near their real worth in the open second-hand market.

By JOHN R. OAKES, Galesburg, Ill.

Used cars? What shall we do with them?

Standard proven cars selling at $2,000 and upward should be rebuilt at the factory, and resold in the regular manner; priced as any other article of merchandise—viz., at a figure that yields a reasonable profit to the factory for labor and material and to the retailer for his part, as well as transportation charges.

Any standard car thus handled will meet with ready sale, because the public already knows the car and trusts the company back of it. Thus is one great item of expense practically eliminated—that of advertising; so that a really high-grade car comes within the reach of thousands who otherwise would buy a new car at $1,000 to $1,500 and not have nearly so good a bargain as they could in the high-grade rebuilt article.

I believe this system could work adversely to none except the makers and venders of the cheap, inferior cars, would be a boon to the public and redound to the success and honor of all that is good in this great industry.

Cars selling at $500 to $1,500, with few exceptions, are not designed for longevity so much as for initial low cost, so that they close their career of active existence much as did the "One Hoss Shay." This general collapse has usually been preceded by a reasonable service for the investment, but it is so general as to baffle any hope of satisfactory reconstruction; so off to the dealer hies the owner and forthwith talks trade. In such a case the dealer has two items to juggle—his commission on his new car and the junk in the old one. Many dealers swap the former for the latter, and, of course, sooner or later appear discreditably in Bradstreet's little journal of facts.

The used car is not so much a problem as an excuse behind which the price cutter hides from his own conscience and from outside criticism. His part and place in the trade is regrettable, but will be less and less until price cutting via the used car route will be as negligible a factor in the automobile business as it has become in any reputable line of merchandising.

As a last word, the used car has a value relatively easy of ascertainment; to this the owner is entitled, and to no more. No law, agreement nor combination of men can pervent some dealers from giving more, except the law of average, and upon that we may depend for final redress, for it will put such dealers out of business.

THE LADY AND THE LIMOUSINE; HER STORY

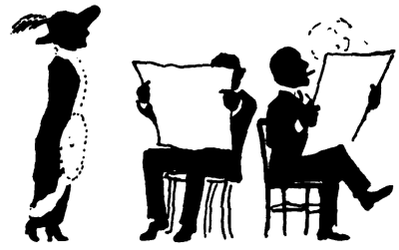
Being the Experiences of a Woman Prospect Who Encountered the Sort of Salesmanship that Sells Cars and the Sort that Does Not—Shortcomings that Exist in Retail Establishments.

Say "limousine" in the average automobile salesroom, and if the salesman does not prick up his ears and display unwonted interest it is because something ails him. Limousine spells "big money" and he is a mere time-server and not a salesman who is not proud of a large sale. But that not all salesmen are equal to the opportunity when it presents itself was made clear by the experience of an intending woman purchaser who recently made the rounds of a number of the better known establishments in one of the largest cities in the country.

She encountered extreme courtesy and lackadaisical indifference, and pretty nearly everything that goes between. If she had

SHE ENCOUNTERED EXTREME COURTESY

been less intent on purchasing a car, her first experience must have discouraged her.



Indifference as an Antagonizer.

In advance, she had become much enamored of a particular car of national reputation, listing at less than $4,000, and her first steps led in the direction of the store in which it is sold. She said "limousine," but the salesman failed to prick up his ears. He had none in stock—and that was the substance of what he told her. He seemed tired to the point of indifference and made not the slightest effort to induce the prospective purchaser to call again. But for her interest in the car she vowed she never would have set foot into the place again.

However, she paid a second visit and fortunately met a radically different type of salesman. He chewed gum, but otherwise he was politeness itself, and if he failed to make the sale it was no fault of his own. A limousine had been received but, as the salesman courteously explained, it already had been sold; in fact, the firm was sold up for a month ahead. The lady, however, was permitted to inspect the car which was awaiting delivery, but to do so it was necessary to go through a not particularly inviting shipping room, enter a freight elevator and go to an upper floor where the body just had been fitted to the chassis.

The Last Touch of Courtesy.

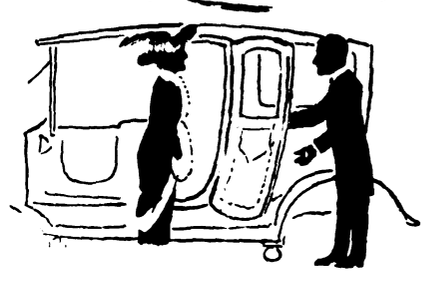
In relating her experience, she remarked the fact that the salesman was so courteous and diplomatic in handling her that she overlooked the inconvenience, the last touch of courtesy being escorting her to her tour-

DEEPLY INTERESTED IN NEWSPAPERS

ing car which waited at the curb. As a whole, her experience was so varied that it cannot but afford instruction to the owners and managers of every establishment engaged in the sale of automobiles and who seek to improve their ways and the ways of their salesmen.

Sales Secondary to Newspaper.

After being shown to her car, the lady visited two other stores in which cars listing at more than $4,000 were for sale. In one, the salesman was alert and met her with a smile and a cordial manner; in the other, the two salesmen were so deep in their newspapers that it was necessary for her to arouse them. Once aroused, however, the one who took her in hand led her skillfully to the good points of his car. His case, however, became hopeless when the lady sought to discover what constituted the equipment of the car. When she detected that several things dear to the average woman's heart were lacking, and he informed her that they were "extras," the interview terminated soon after.



"Oh!" she exclaimed, "I want a car that is all dressed up. I thought your price included everything. I wouldn't pay a penny extra, and at your price I can't see how you can expect it."

She laughed amusedly in relating some other of her experiences.

"In one place," she said, "the salesman almost apologized for the absence of a person whom he called the 'sales manager.' He would like very much to have me meet him, but, unfortunately, that distinguished gentleman was lunching at Sherry's, or Delmonico's—I forget just which place. I don't know whether I was informed of the fact as a means of impressing me, but I am afraid I smiled in the young man's face.

Sample Car Too Costly an Item.

"In this store also there was no limousine in evidence. In fact, that was so generally the rule that I finally remarked it, and suggested that department stores always re-

THEY HAD A BODY ON ROLLERS

tained at least one sample of everything, no matter what it might be. The salesman to whom I made the remark expressed his regret and impressed me with the heavy demand for their limousines and of the idle money which would be represented by a sample car of such value remaining unsold for any length of time. I could not but admit the force of the statement, and in one of the last stores I visited I found that at least one firm had found a way of solving the difficulty.

"There, on the salesroom floor, they had a limousine body standing on rollers, or skids, or whatever you call them. It abundantly served at least my purpose. I chiefly was interested in the external appearance and appointments of the interior of the car, and as this firm also had a bare chassis on the floor, it was a simple matter to inform me that the difference between the limousine and the touring car was wholly a matter of body, the same chassis serving for both.

Salesman Lacked Manners and Gumption.

"In still another establishment in which they had nothing to show, the young sales-

Digitized by Google

man sat on the edge of a table as he talked, and kept his hat on his head while he did so. I had heard his car well spoken of and was rather anxious to see it, and when he informed me that a customer's car was having work done on it in a nearby service station I accepted his invitation to go and see it. The driver of their demonstrating car was in the salesroom at the time. He was smoking a cigarette and wore his cap with the peak pointed to the rear, and I had to ride behind that fellow to the service station. The salesman himself had not gumption enough to accompany me. In fact, he lacked it to such an extent that he did not even open the store door for me to make my exit.

Long Wait in a Service Station.

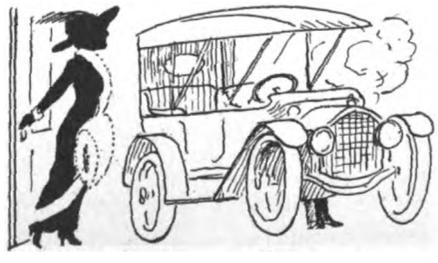
"At the service station—a large establishment—I waited 10 minutes before anyone could be found to take me to see the car, and again it was necessary to go to an upper floor in a freight elevator and dodge around between repair work and repairmen. The chauffeur who finally located the car apparently was either dumb or knew nothing about it, and while the car is a good one, it could not speak for itself, and after my experience I don't think I would have bought it even had it been able to do so.

"One of the politest men I met was doing business amid the most discouraging surroundings. His store was so small and so crowded that it was difficult to turn around in it, but the man himself—he was the proprietor—was so pleasant and such an agreeable talker that he more than made up for the drawbacks of his store. Once when I mentioned a rival car he spoke so highly of it that I could not well fail to think well of the man himself. His store was too small to contain a limousine and the only one he had was stored in a basement several blocks distant, but the man was so much a gentleman, and was so nice in every way, that I could not well refuse his invitation to inspect the car. Unfortunately, I never saw it. When we reached the dimly lighted basement he found he had forgotten the key to the storeroom.

Frankness That Impressed Favorably.

"Perhaps the car had something to do with it, but when I look back I think the salesman who most impressed me was neither particularly bright in appearance, alert in manner nor engaging in conversation. He was quiet, rather slow-spoken and plainly not particularly well educated. Perhaps he impressed me favorably because he agreed with nearly everything I said, but, at any rate, he was well informed regarding his car and he was plainly honest and sincere in his answers. He was not given to the exaggeration which I encountered in several places. He did not attempt to tell me, for instance, that they were getting 16 or 18 miles per gallon out of their car, as other salesmen had told me, when I knew that our own—a much lighter touring car—was not able to give more than 10 or 12 miles at the best, although the cars sold by other of the exaggerators employed the same carburetter that we did.

"But in this honest looking fellow's place, as in so many of the others, there was no



HE KEPT HIS HAT ON HIS HEAD

one 'on the door,' so to speak. Twice when I called there was not a living person in sight. Both of the salesmen were seated at their desks, which were hidden by the cars, and although once I purposely slammed the door no one immediately came forward to meet me. In at least two of the places I visited I found men hurriedly throwing away cigarettes, or putting down cigars before they came forward. In another store, I found three men seated in a touring car, reading newspapers, and it was not until I bluntly asked a question that any of them paid the slightest attention to me, and then they informed me that the company that sold the car, the name of which was displayed on the window, had moved elsewhere several days before.

Salesmen's Faith in Demonstrations.

"Demonstrations?" said the lady repeating the question, "Oh, heavens! If I had accepted all of the invitations I would be riding yet. Nearly every salesman seemed to imagine that a demonstration was all that was necessary to close the sale, and,

THERE WAS NO ONE "ON THE DOOR"

strangely enough, nearly all of the demonstrations tendered me were touring car demonstrations and not limousine demonstrations. Perhaps there's no difference, but somehow I am possessed of the notion that there is such a difference in the feel of the two cars that no touring car demonstration ever will prove more than half-sufficient to the intending purchaser of a limousine.

"My opinion of automobile salesmen? They're a much-mixed lot," she replied. It is plain that a number of them have much to learn and that many of them would not last long in a department store where they would be watched, and where they are required to do certain things in certain ways."

Possibilities of the Parcel Post.

When first the Parcel Post approached reality those within the automobile industry who were heartiest in welcome maintained that attitude because of the number of motor driven vehicles which it was announced that the new governmental enterprise would require; however, there now is opening another field wherein the post may be of great service to the trade. That is in transporting small articles such as parts and supplies.

The first extensive use of the post for automobile purposes occurred in the State of Iowa, where about 5,000 license plates have been distributed through the mails. Some delay was experienced in turning out the numbered tags, and when a shipment of about 5,000 was received at the State capitol shortly before the old year died, they were held until the new regulations became effective and were distributed in that manner. The authorities in Wisconsin plan to make a similar use of the post, and Secretary of State Frear states that in distributing the 25,000 license plates which will be used about $2,500 will be saved. Formerly the plates were expressed.

Queen Mother Buys Miniature Cadillac.

When those who were responsible for a miniature Cadillac car that amused visitors to the recent French show evolved the idea of its production it is unlikely that they suspected what its ultimate destination might be. It has been purchased by Great Britain's Queen Mother, Alenandra, as a gift for one of her grandsons.

The car is an exact replica of a full-sized Cadillac, with all its dimensions reduced to two-fifths; the wheelbase is four feet. Power to drive the vehicle is obtained from the Delco electric lighting and engine starting system with which all Cadillacs are equipped, there being no gasolene motor. Control is effected by means of a side lever working in a quadrant, and the speed obtained is 16 miles an hour. An idea of the size of the car can be gained from the dimensions of the tires, which measure 15 x 2 inches and were especially constructed for the service. The "baby" car is completely equipped, of course, even to a miniature real Klaxon signal and a top and windshield,

IN BUSINESS FOR FUN AND YET MAKES MONEY

Toronto Dealer Who Takes Delight in the Tight Corners of Business—Works on the Principle That What He Must Have He Will Surely Get—Trade Tactics That Have Made Sales.

Putting business before pleasure is supposed to be, and perhaps is, the only sound theory to be pursued by him who hopes to attain success, and if a man should declare that he was launched upon the business sea at the age of about 16 with no money and an inherent desire to put pleasure before the drudgery of business and should further state that he had always let his desire be gratified, one naturally might expect this individual to be an itinerant mendicant, riding the brake rods with a sandwich in his pocket.

On the other hand, should this man prove the possessor of a prosperous business in a city of 300,000 inhabitants and still insist that his former statement were true, the congruity of the facts might be difficult of explanation until the man cleared the situation by the assertion that he is in business for the "fun there is in it." The man who is the principal actor in this peculiar "play" is W. J. Ross, who is the substantial portion of the Ross Motor Car Co., Ltd., of Toronto, Ont.

Works Hard Because It Is Pleasure.

Ross does not appear to recognize the fact that a man will work hard at pleasure and that, while Ross is having a lot of fun, he nevertheless is working to the limit. And his hair isn't getting gray, either.

He is Canadian distributer of Regal cars, and is an excellent type of the man who has become a rattling good salesman without very extensive schooling in salesmanship, or any other form of instruction. The Ross formula for becoming this type of salesman is: Have your father fail in business just as you are getting through high school; get a job in a machine shop at $2 a week and pay $3 board; work up in this trade until you see there is not much in it; buy a moving picture outfit and tour the country, acting as a "lecturer"; return to your home city; decide you want to be an automobile dealer; order a load of cars and then dig around to find the money to pay for them when they arrive. The latter move might seem difficult, but it was mere matter of fact performance with Ross, who works on the principle that inasmuch as he had to have the money to pay for the cars, the only result conceivable was that he would get it—how was something to be figured out after the ordering of the cars had been attended to.

Such work is what adds zest to Ross's business; getting the money and then ordering the cars would have been too usual. In like manner he one day went to a bank and said, "I need $600; I suppose you'll want a note or something?"

"Note!" exclaimed the manager. "You talk just as if you were going to get it."

"I've got to have it," answered Ross, "therefore I'm going to get it; one of the purposes of a bank is to loan money to the business men of the city, and of what good are you to me if you don't loan me money?"

When Nerve Effected a $600 Loan.

The very nerve of the thing was of more avail than a pocket full of references, and Ross got the money; also he paid it back when he said he would, and has borrowed there ever since whenever occasion has demanded it. One day a salesman tried to load Ross up with a stock of goods; the salesman said he was willing to extend credit on Ross's rating.

"Rating!" said Ross, "I haven't any."

"Yes, you have," insisted the salesman; "it says, 'This man is an A No. 1 salesman and will make good.'"

Originality bristles out all over this Canadian dealer; he sells cars in his own way, but the main point is that he sells them, and demonstrates his true salesmanship in that his customers come back for more. Selling cars in Canada, he states, is difficult, because competition is more than keen; the dealer in the Dominion not only is obliged to compete with cars of European, Canadian and American make, but in addition, he says, American manufacturers make Canada a dumping ground, shipping their surplus stocks into that country at prices which make life miserable for the established retailer.

Christmas Remembrances Effective.

Ross has been Regal distributer for all of Canada only a year; previously he was Toronto dealer only. As stated, he borrowed the money to go into business, but, as he himself expresses it, he "is now on his way back from the poor house." Why and how he sells cars is exemplified by instances of his business methods. A year ago Christmas he performed a clever business stroke that aided in making him solid with his clientele. He decided to remember some of those who had bought cars of him within the last couple of years and believed it would be appreciated, especially by those men—and women, too—who are on the shady side for forty, for they, said Ross, "are looking backward at the Christmas times that have gone before; they are not filled with the exuberance and hope for the future that fills the heart of the younger men, and they are quick to appreciate a Christmas remembrance."

Some of Ross's customers smoke; others do not. Cigars would not be acceptable to all, so he went to a candy dealer who was a Regal owner and whose goods bear a standard name which is beyond reproach and spent nearly $100 for candy. His car and a driver delivered these packages Christmas morning, with the Ross card attached, to a list of about four score of his customers. The effect was magical. Such tactics on the part of automobile dealers were unknown, and straightway he became more than "the man who sold them their cars"; he became their friend. At least three sales are directly traceable to this act, for the news was not slow in spreading, and what Ross lost in dollars he more than gained in new customers and added profits.

Winning Through Fair Dealing.

Ross says he rarely has trouble over his repair work, because he will never deliver a car until the owner has called at the Ross place of business, ridden in the car with a Ross employe and thus given an opportunity to make sure he is satisfied. On one occasion when he failed to follow this policy he was compelled to sue for his account. The action had been postponed once or twice, and the day before it was again due for trial Ross telephoned the defendant and said: "I suppose you know our case comes up to-morrow? I don't want you to forget about it."

"So it is!" exclaimed the owner; "and say! I can't possibly attend to-morrow."

"I am perfectly willing to postpone it again if it will be any accommodation," replied Ross, and before the owner could reply the dealer added: "What's the use of us

Digitized by Google

quarreling over a little thing like this? I know you think I overcharged you, but who knows better than I do how much work and material were required on that job of yours? Do you suppose I would be a judge of any bill that you rendered? And is anyone in this town likely to do better work on Regal cars than I am? Come in, anyway, and let's talk it over."

This treatment won the owner. Not only did he come in to "talk it over," but he paid the bill and actually bought a new car. He admitted that he might have been illy advised when friends told him he was overcharged, and proved easily open to amiable argument.

That it is difficult to secure cash payments is disputed by Ross.

"I do a cash business," he said, "and find little trouble in doing so. If you go to buy insurance or a railroad ticket you have to pass your money in through the window before you get it. If a big and wealthy corporation like those will not give credit why should and how can I, who have much less money, extend credit? When I present the situation in this light, most people see the point and admit the force of it."

One Solution of Used Car Problem.

Similarly, when intending purchasers talk much of guarantees and become insistent Ross has an answer for them. "You don't want a guarantee; what you want is insurance," is the substance of it.

The used car probem is no problem at all with Ross; it fits into his plan of merchandizing, and cars are traded freely but never at a loss. Several deals may be necessary before the sale is cleaned up, but it only serves to inject the business maneuvering which he likes, and often, not valuing the selling labor, a car that sells in Toronto at $1,325 will bring nearly $2,000.

He even buys used cars. One was purchased for $800. This was traded for another used car and $650, and the second used car was sold for $300 and an equity in a property that bore an $800 mortgage but would bring $1,000 under the hammer. Many of the deals involve real estate transfers, and Ross prides himself on his ability to estimate the fluctuating value of Toronto property.

Deals Are Involved But They Pay.

A new $1,325 car was sold for $925 and an $850 equity in a piece of real estate which eventually will net the dealer a profit of several hundred dollars. Another car of this type brought $925 and a used car. The used car and $50 bought a mortgage of $1,050 which carries 6 per cent. interest and is payable at the rate of $25 every six months. There are numerous deals like this which require business engineering, but which are more a pleasure than a hardship to the engineer.

Unlike many dealers, Ross is willing to turn a dollar at anything and is willing to learn anything he can about selling. Russian fur sellers are admitted to be some salesmen in Canada, and when a pair of them offered a coat, rug, muff and other pieces to Ross one day he determined to get a lesson in salesmanship. They first asked $400, but he studied their methods until the price was $150; then he bought.

"No," he said to the salesmen, "I don't want the furs. But I know a man who may buy them, and all you get over $150 we'll split fifty fifty." Ross summoned a prospective buyer to his office and watched the whole deal retransacted. The second price was $200 and, besides getting additional instruction in that class of merchandizing, Ross made $25.

Good Turns Bring "Tips" of Sales.

Although he does not use the American word "service," that is a vital part of his business. He is ever on the lookout to do a good turn for anyone, and the result is a wide circle of Toronto citizens who are constantly "tipping off Ross" to prospective buyers. He spends considerable money in advertising. He says he would rather put money into advertising than to use it in beautifying his salesrooms. He tries to hold his customers close to him by various means. For instance, he sells a five-gallon can of oil, that ordinarily costs 85 cents a gallon, for 65 cents, merely to accommodate his trade and handles accessories on the same basis.

Adaptability and alertness of mind and speech partially describe his make-up. When a woman who owned a Regal ceased to buy gasolene of him, he discovered that she doubted that she had used such a quantity as she had paid for. He diplomatically invited her to "drop in," and then asked her how much she had bought elsewhere, and when that quantity and those of Ross's bill were compared with the reading of the odometer, the car being at the door, he showed the woman that, from her own figures, that car must have given an unprecedented mileage per gallon. There was no answering argument.

Making Good Nature an Asset.

From this it might be imagined that Ross got the amount of his bill; but he didn't. He had proved to the woman that he had good reason for his claim, but, said Ross, "She wouldn't have paid anyway; she still owes me." He states, however, that this bill is one of few which he has failed to collect, and just as he laughs as he describes his methods it is plain to see that the same laugh is a valuable business asset.

Believing that when in Rome to do as the Romans do is good policy, Ross has been known to wax his moustache and simulate a French Canadian when doing business in Lower Canada, just as when in Nova Scotia he can employ the Scotch accent to perfection and talk more like a Scotchman than the Scotchman himself; for Ross, by the way, is a canny Scot.

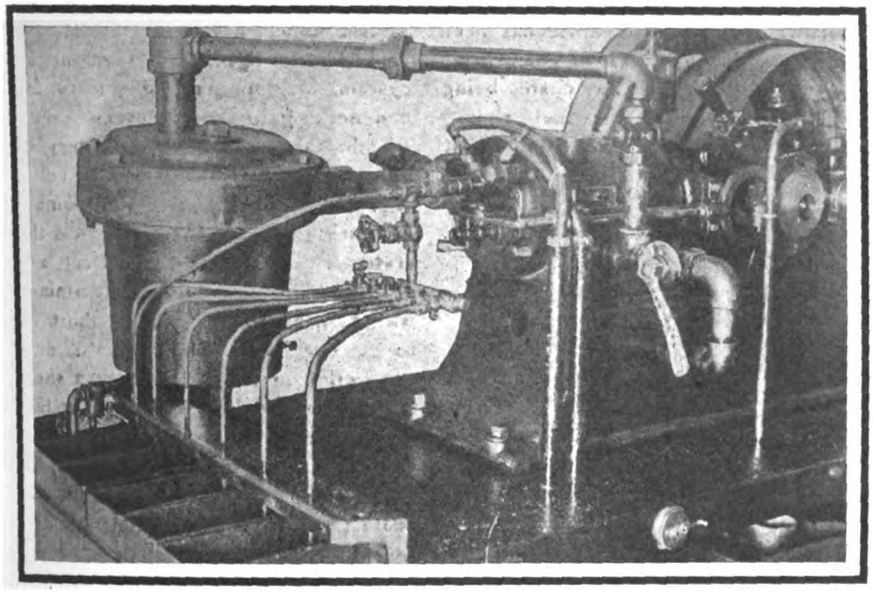
Imports Continue to Decrease.

Losses by Germany and the United Kingdom served to more than offset gains made by the other automobile-exporting countries, and as a result the importations into the United States during November last fell away 9 per cent. in number of cars and $15,782 in value, or 7 per cent. The first 11 months of 1912 were less than that period of 1911 by 188 cars, or 22 per cent., and $99,479, or 5 per cent., the figures for 1911 being 869 cars at $1,871,414, and for 1912, 781 cars at $1,771,935. The average value of cars imported in November, 1912, was $2,279.

The country which made the greatest gain was France, whose shipments went from 32 to 42, a gain of 10 cars, or 31 per cent., while the value jumped from $94,291 to $108,356, an increase of $14,065, or 15 per cent. The United Kingdom's shipments declined by 16 cars, or 70 per cent., and $29,482, or 62 per cent. The parts shipments for the Novembers lost by $8,587, or 27 per cent. The figures in detail are:

	Nov., 1911. Number.	Value.	Nov., 1912. Number.	Value.
France	32	$94,291	42	$108,356
Germany	18	41,768	11	28,206
Italy	18	22,897	19	25,952
United Kingdom	23	47,152	7	17,670
Other countries	5	8,025	8	18,167
Total	96	$214,133	87	$198,351
Parts (except tires)	..	30,450	..	21,863
Total cars and parts	..	$244,583	..	$220,214

Seaton Forms Spring Wheel Company.



B. C. Seaton, a former wheelwright now resident in Nashville, Tenn., who for more than five years has been engaged in the invention of a spring wheel, finally has interested capital in his device and the organization of the Seaton Wheel Co., of Nashville, has resulted. It has been incorporated with an authorized capital of $130,000. The officers of the company are: John T. Landis, president; S. S. Lord, vice-president; Granbery Jackson, treasurer; J. R. Boone, secretary. Inventor Seaton will be general superintendent. It is the intention of the company to form 100 or more subsidiary corporations throughout the United States. One of these subsidiaries, in which J. R. Tubb of Sparta, Tenn., and Frank S. Wheeler of Mt. Pleasant, Tenn., are interested, is being organized in Nashville itself. The Seaton wheel is of the "wheel within wheel" type.

STRANGE NEW MOTOR USES ALMOST ANY LIQUID FUEL

Has Neither Carburetter Nor Piston Rings But Burns Anything From "Gas" to Tar Oil—Operation Explained.

When a problem that affects a very considerable percentage of the population of the earth grows to such proportions that its shadow becomes heavy and chilly and causes the people to wonder if they ever again will see the light of reasonable prices, there usually is a movement—or rather a multiplicity of movements—set on foot to clear the air and restore normal conditions. So it is with the fuel problem that is causing so much good ink to flow over so much good white paper, and is perturbing so many brains stored with the lore of oils and their distillation and of gas engines and their combustion. Broadly speaking, there are two lines of endeavor, one leading in the direction of a new or modified fuel and the other trending toward the adaption of motors to available liquid fuels.

TISMER'S ENGINE SHOWING INTAKE AND FUEL PIPES

The adaption of existing motors to existing fuels is the line of work that has engaged the attention of P. G. Tismer, of New York, for many years, and the first, but by no means the last, surprising feature of the system he has evolved for the consumption of heavy oils is that it involves the abolition of many parts of the conventional engine and their replacement with simpler apparatus or else with nothing at all. For instance, the carburetter has been wholly dispensed with, and in its place there is—nothing. The fuel pipe leads straight through the cylinder head without so much as a spray nozzle and without an injection pump of any kind. There is no cooling system; it is necessary only to state that the motor in question is an old one, formerly water-jacketed, but that there are no water connections, and the plugs in the jacket have been removed. There are no rings on the piston; nevertheless, there is no indication of loss of compression and no signs of abnormal wear, though the engine has been running long enough to develop wear had conditions favored it.

Demonstrations of the ability of the engine to run on almost any liquid fuel are being made at 134 East 41st street, New York.

As to what the motor will do, it would appear that it will do just about what any well-ordered gas engine will do, and that on almost any liquid fuel. As the accompanying illustration shows, there is a row of little tanks from each of which a pipe leads to a header; from the header a single feed pipe runs to the cylinder head. There is a cock on each pipe, and any fuel or combination of fuels can be drawn upon. The tanks contain ordinary crude oil, kerosene, fuel oil, gas-house tar, machine oil and a mixture of oils rejected by the motor, as will be described later. There is but little difference in the running of the motor, no matter what fuel or combination of fuels is fed. From a state of stony coldness the engine will start quite readily on crude oil or gasolene, and on any of the other fuels when it has been well heated by running.

Piston Operates Without Rings.

This iconoclastic motor is an old machine —in fact, an obsolete model— having a single horizontal cylinder of 3½ inches bore and 4⅝ inches stroke and valves in the head, the intake being automatic and the exhaust valve operated by a rocker arm and a long push-rod. The original piston has been discarded and the new one is a plain cylindrical affair, without rings or grooves of any kind; it is a little longer than the average piston and has a clearance in the cylinder of half a thousandth all round. It is very deeply cupped; the "head" is sunk until it is practically in the middle of the piston, the piston pin thus being somewhat farther forward than usual. The piston comes quite close the cylinder head on the compression and exhaust strokes, so that the compression space is almost wholly within the cup of the piston.

Feed System of But a Single Pipe.

The many-piped fuel feeding system is intended for demonstration purposes only. Ordinarily there would be but a single pipe, unless the fuel should be one upon which the motor could not start, when a small auxiliary starting tank would be required. A single feed pipe leads straight through the cylinder head, interrupted only by an ordinary regulating valve. The oil is drawn merely by the partial vacuum created by the piston on the intake stroke, the quantity being regulated by the valve in the line pipe. An air pipe, of about the same size as the oil feed pipe, joins the latter just before it enters the cylinder head. Close to the cylinder, seated in the fitting which serves to connect the fuel pipe with the cylinder head, is the spark plug, which is unusual only in that it has two separately insulated electrodes instead of one insulated and the other grounded. It is so located that the fuel passes over the sparking points at every intake stroke, thus assisting in cooling the points, but apparently not interfering with ignition.

Exhaust Gas Fuel at Low Speed.

An ordinary high-tension ignition system is fitted. The main air supply is taken in through what formerly was the intake pipe, a plain valve being used to regulate the air supply. A small pipe leads from the exhaust pipe to the main air pipe, which it enters between the regulating valve and the intake valve. This is for a rather curious purpose. When the motor is to be throttled the method is to cut off part of the air supply and admit exhaust gas in its stead, the result being that only part of the normal charge is burned because there is not sufficient oxygen to consume all of it. Lubrication of the cylinder is effected by means of a large sight-feed oil cup placed on the top of the cylinder.

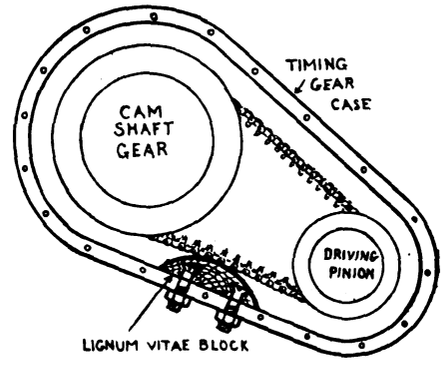
The most remarkable fact in connection with the running of the Tismer motor is that the raw oil is drawn into the cylinder and burned with air; if there is an excess of fuel, that which is not burned is thrown

Digitized by Google

out with the exhaust and collects in the bottom of the cast iron muffler "pot," whence it is drawn off occasionally and can be used as fuel. The air which enters with the fuel is taken in merely for the purpose of assisting in the cooling of the sparking points, which otherwise become overheated. That the small air current does not have any effect aside from this cooling of the points is indicated, Mr. Tismer states, by the fact that the motor runs equally well without it until the points overheat and burn. The inventor states that when an excess of fuel is passed through a certain amount of it goes off with the exhaust in the form of smoke, and so there is a little waste.

Excess of Fuel That Is Beneficial.

The extreme cheapness of some of the fuels—the gas-house tar, for instance, which can be had almost for the carrying away—makes this a matter of little importance, in the first place; and in the second place, this waste can be eliminated by close regulation of the fuel supply. It is preferred, however, to run with an excess of oil, because this practice reduces, if it does not practically eliminate, the tendency to produce sooty deposits on the valves. When running with a maximum of fuel the exhaust is perfectly clear and smokeless; a very slight excess of fuel forms a carbon deposit, in the all too familiar way, while if there is a considerable excess most of it is condensed in the muffler and small detached particles burn quite slowly, because of the shortage of oxygen, and pass out with the exhaust in the form of sparks. This was plainly shown by running the engine with the exhaust muffler cut out and the gases shooting straight into the air.



Cooling Induced by Oil Film.

The fact that there is no cooling system appears to be intimately connected with the the construction of the piston and with the lubrication. Tismer expresses the opinion that the average gasolene or gas motor cylinder is insufficiently lubricated. The close-fitting, sharp-cornered piston rings wipe off all the oil except a very thin film, he states, and this film is so light that it is very easily burned off. So he has made his piston ringless, arguing that in this way the film of oil on the cylinder walls will be practically undisturbed and of sufficient thickness, so that it cannot burn through in the time during which it is exposed to the heat of the burning charge. The comparatively thick film of oil appears to protect the cylinder walls. At any rate, they do not overheat. Neither is the exhaust very hot, for the bare hand can be held within ten inches of the open pipe without discomfort.

Tismer has not yet made accurate laboratory tests necessary to determine the exact power developed, amount of fuel consumed, and so on, though he expects to do so shortly. He has confined his efforts to the production of a system for burning the lowest grades of fuel with satisfactory results. The ability of the motor to run, jacketless, for long periods without overheating or becoming clogged up with carbon was tested by using it to run the machine tools in a shop for several months. It is not proposed to build special motors for the present, but to convert existing engines to use heavy fuel, and Tismer has work already under way on several engines.

Taking Up Wear in Silent Chains.

One of the results of the efforts of motor manufacturers to eliminate noise has been the adoption, in some cases, of chain drive for the timing mechanism, the chains being of the "silent" type. While the primary object of this arrangement is attained, at least while the chain is new, the fact that

METHOD OF ELIMINATING SLACK

all chains inevitably "stretch" or lengthen because of wear, sooner or later causes looseness which results in noise and, what is worse, inaccuracy of timing. The provision of means for taking up slack is by no means an easy problem, and in some cases it has been solved (?) by making no such provision, in which case the chain must be renewed when worn or else some scheme adopted to take up the slack.

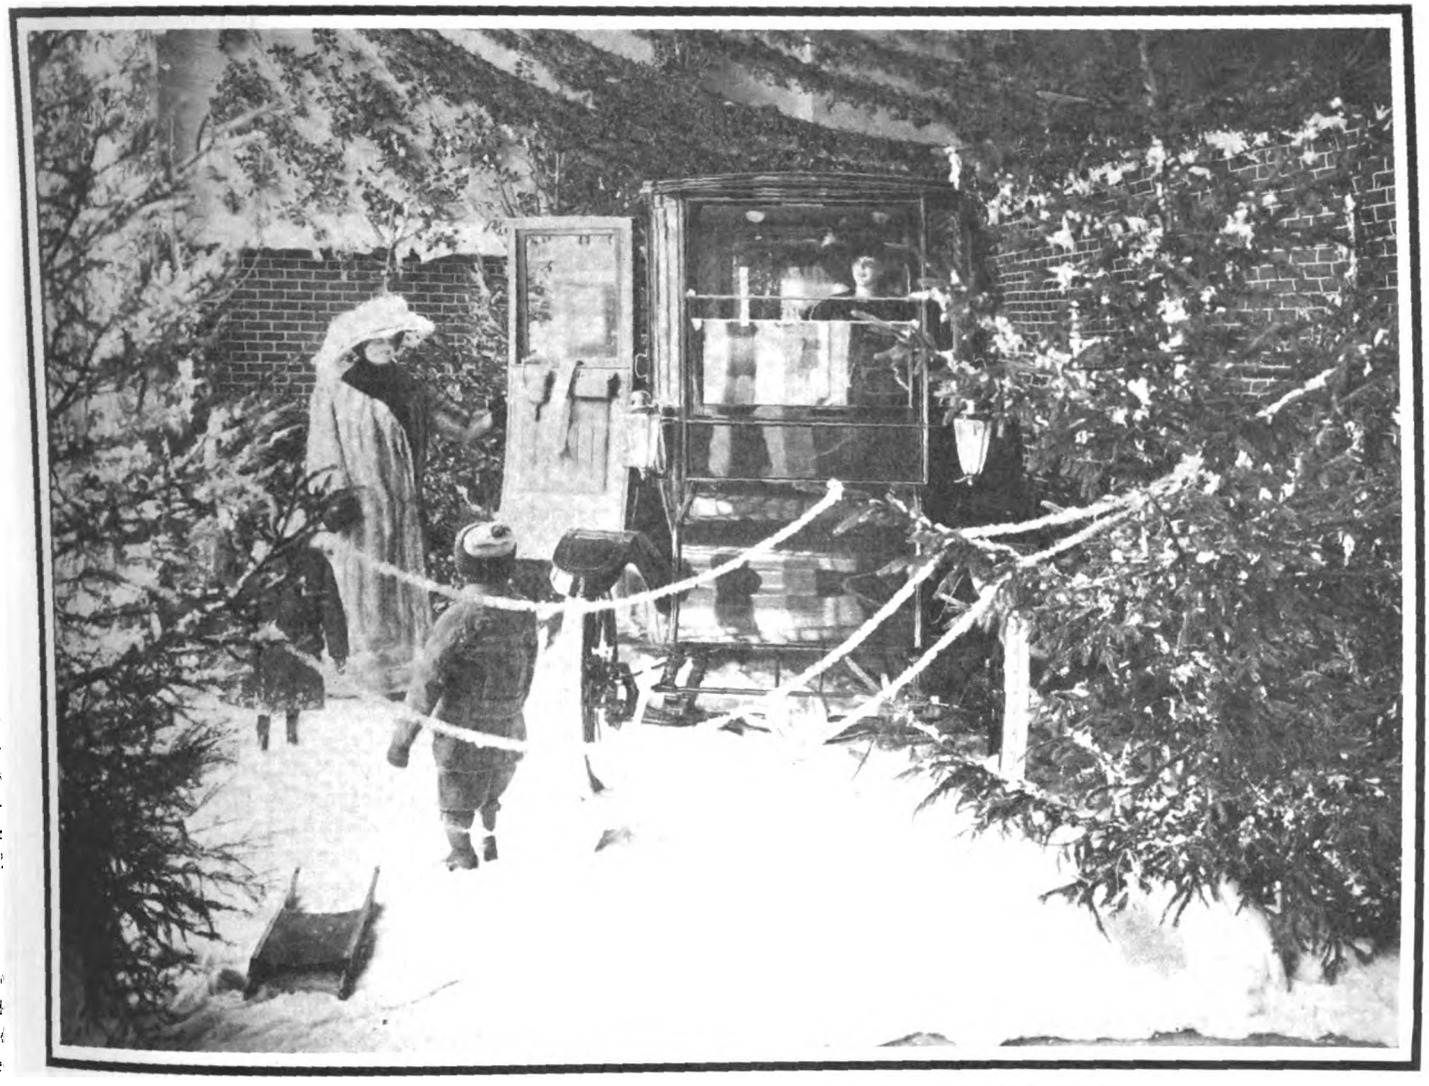
Such an adjusting means is shown in the accompanying illustration; it is both simple and effective, and though it cannot be called a really permanent thing, it is good for about three months' wear under average conditions, and further slack as well as wear of the adjuster itself can be taken up by shimming up the block, which is of lignumvitae. This tough, wear-resisting wood answers the purpose better than metal because, while it has remarkable durability under friction, it does not produce a noise such as a metal block undoubtedly would when the chain links slide over it.)

The illustration is self-explanatory and shows the chief point of advantage of the adjusting block—that is, that it can be used where there is very little clearance between the casing and the chain, and room does not exist for a more elaborate and perhaps more satisfactory and durable arrangement. So far as the matter of bringing the timing back to its original adjustment by this sort of take-up is concerned, it may be said that the tendency of wear, whether it is of the teeth of the chain or of the sprockets, is to cause lag or retardation in the timing; the adjuster, while it takes up the slack and prevents back-lash and noise, has no effect tending to correct the timing. On the other hand, it does not make matters any worse, for the lag due to stretch and wear remains exactly the same.

Search That Reveals Lighter Faults.

As a logical means of detecting faults in any electric lighting and engine starting system, there is everything to be said for, and nothing to be said against, systematic search. Commencing at the battery, its condition should be tested with a volt meter (never with an ammeter), following which the wiring between the battery and the generator and between the battery and the starting motor should be examined for frayed insulation, breaks or short circuits to the car frame. Short circuits, or faulty connection at the switches, next should be looked for, and last, for it is least likely to give trouble, the cut-out should be examined to make sure it is operating properly. Where a system is equipped with fuses to protect the line, it is obvious that they always should be examined first, for it is no easier to light the lamps or to start the motor with a burned-out fuse in the line than it is to run an automobile with the fuel turned off and the carburetter empty.

Vexations Caused by Lost Motion.



It is entirely possible for a carburetter to be in the best of condition, perfectly adjusted and well suited to the engine, and yet fail to respond as it should to the movement of the throttle lever—and with nothing the matter with the lever, either. Similarly, the magneto may be right in every way, and yet fail to have the usual and desired effect on the speed of the motor when the spark lever is moved.

The answer to the seeming puzzle is that there may be—and not infrequently is—something wrong in the connections between the levers and the things they are designed to operate. For instance, an arm may be slipping a little on a shaft or rod, so that only part of the movement of the lever is transmitted to the carburetter or timer; there may be a loose adjustment that permits slip; there may be an obstruction that stops the movement short of its full swing; or there may be a total disconnection somewhere.

WINDOW DRESSING WITH A DEFINITE PURPOSE

Striking Display Arranged by a Detroit Manufacturer and the Suggestions it Conveyed—"Properties" Employed and Effect Obtained, Which, With Well-timed Advertising, Brought Immediate Returns.

GRINNELL'S CHRISTMAS WINDOW THAT COMMANDED ATTENTION AND SOLD ELECTRIC CARS

Effective as a window display may be, it is more powerful as a trade winner if it be but one part of a selling idea which has various supplementary features to help out the window display and in which the window display supplements the other directions of effort. A clever window dressing in connection with a Christmas selling idea was worked out by the Grinnell Electric Car Co. in its branch in Detroit, Mich.

The whole thought was to capitalize the idea of an electric car as an ideal Christmas gift, and to this end a series of letters was mailed to a selected list of prospects and newspaper advertising was carried as a help to the conclusion on the part of the prospective buyer that a Grinnell electric would be overwelcome at the door on Christmas morning. All the way through was carried the idea of happiness in the family, and the advertising was essentially of the "heart appeal" type.

At this point enters the effectiveness of the window display. Having had brought to his attention through direct and newspaper advertising the joy and pleasure which an electric might bring to his family and himself, the prospect had it doubly stamped upon his mind when he appeared in front of the Grinnell store. In the windows he saw an electric emerging from the gate of a walled estate, one woman seated within the cozy interior, another standing in the snow outside with one hand upon the opened door and a snow-covered youngster debating whether he would rather give up the joys of playing in the snow with his new Christmas sled or ride with "mama" in her holiday gift.

Evergreen trees and shrubbery with snow-laden branches gave an aristocratic and wintry touch to the scene and accentuated the luxuriousness of the car. While the Grinnell idea was designed to catch the Christmas shopper, it may be none the less effective during the succeeding snowy and cold months, and that the idea was worth while is evidenced by the fact that the scheme brought the Grinnell branch one of the best months of business it ever experienced.

1,022,754. Spring Wheel for Vehicles. Augustus F. Priest, Chicago, Ill. Filed May 19, 1910. Serial No. 562,119. (Semi-circular leaf springs form the spokes.) 3 claims.

1,022,775. Vehicle Spring. Frederick Denman, Highland Park, Ill. Filed Sept. 9, 1910. Serial No. 581,297. (End of half-elliptic leaf spring is attached to one end of a lever of the first order which operates in conjunction with a second similar lever attaching to the axle and a helical spring.) 6 claims.

1,022,801. Instrument for Indicating Speed and Running Time of Machines. Ralph Shipman, Sunbury, Pa. Filed Feb. 5, 1910. Serial No. 553,610. (Clock mechanism in conjunction with rate indicator). 10 claims.

1,022,803. Internal Combustion Engine. George A. Troutt, Detroit, Mich. Filed Feb. 10, 1910. Serial No. 543,023. (Means for injecting fuel into cylinder of a two-cycle motor.) 1 claim.

1,022,820. Starter for Internal Combustion Engines. George G. F. Boswell, Indianapolis, Ind., assignor of one-half to John L. Peetz, Indianapolis, Ind. Filed Feb. 6, 1911. Serial No. 606,695. (Hand operated starter.) 3 claims.

1,022,842. Detachable Rim for Resilient Tires. John William Hall and Cyril Baynes, London, England. Filed July 20, 1908. Serial No. 444,493. (Rim divided into sections which are clamped in place.) 7 claims.

1,022,856. Tire. Frank Marinics, Expedit, Pa. Filed Oct. 6, 1911. Serial No. 653,186. (Coiled springs enclosed in casing.) 1 claim.

1,022,864. Gas Engine. Robert S. Moore and James Lee Simmons, Washington, D. C., assignors to Gyro Motor Co., Washington, D. C., a corporation of Delaware. Filed Nov. 1, 1910. Serial No. 590,237. (Rotary cylinder motor with inlet valve positioned in the piston head and operated by a cam on the connecting rod.) 8 claims.

1,022,885. Resilient Wheel. Arthur Sherwood, Plantsville, Conn. Filed Jan. 24, 1911. Serial No. 604,447. (Helical springs enclosed in telescoping tubes which form the spokes, and rollers provided on the ends of the spokes to permit limited relative motion of the spokes and the rim.) 1 claim.

1,022,887. Harlow Orville Shockley, Darlington, Wis.) Filed Nov. 25, 1911. Serial No. 662,411. (Pneumatic hub.) 4 claim.

1,022,909. Universal Joint. William A. Whitney, Rockford, Ill. Filed July 30, 1908. Serial No. 446,055. (Ball and socket joint with steel balls housed in recesses formed between male and female members.) 4 claims.

1,022,913. Bolster for Vehicles. Roy J. Woodward, Fresno, Cal. Filed Sept. 11, 1911. Serial No. 648,822. (Inverted platform leaf spring which contracts, upon compression, with the arms of a supporting bracket.) 1 claim.

1,022,926. System and Apparatus for Starting Internal Combustion Engines. James C. Boyle, Calgary, Alberta, Canada. Filed March 26, 1910. Serial No. 551,610. (Valves for admission of compressed fuel to the respective cylinders electrically operated in conjunction with inlet and exhaust valves of the motor.) 7 claims.

1,022,966. Resilient Tire. Harry B. Montgomery, Harrisburg, Pa. Filed June 29, 1911. Serial No. 636,043. (Inflatable tube between wheel rim and felloe.) 1 claim.

1,022,990. Electric Igniter for Explosive Engines. Lewis E. Wegner, Nebraska City, Neb., assignor of one-fourth to Joshua Gilson, Nebraska City, Neb. Filed June 10, 1911. Serial No. 632,405. (Make and break mechanism.) 2 claims.

1,022,9991. Oiling System for Automobiles. Ernest M. White, Globe, Ariz. Filed July 29, 1911. Serial No. 641,299. (Constant level splash system.) 6 claims.

1,022,999. Automobile Shaft Coupling. John N. Bashaw, Lake Geneva, Wis. Filed Feb. 18, 1911. Serial No. 609,492. (Ball and socket universal joint with disk attached to ball operating in a slot in the socket.) 2 claims.

1,023,004. Gas Controlling and Lighting Apparatus for Automobiles. Allen G. Black, Springfield, Mass. Filed Feb. 17, 1911. Serial No. 609,225. (Friction lamp lighters operated from the dash.) 2 claims.

1,023,007. Automobile Door. Lucian R. Colbert, Massaponax, Va. Filed April 8, 1911. Serial No. 619,883. (Telescoping door for use with convertible bodies). 4 claims.

1,023,010. Spring Wheel. Harry E. J. Foerster, St. Louis, Mo. Filed Sept. 30, 1911. Serial No. 652,065. (Helical and leaf springs alternately disposed between wheel rim and felloe.) 1 claim.

1,023,016. Automobile Horn. Charles Raymond Heizmann, Reading, Pa. Filed Aug. 25, 1910. Serial No. 578,875. (Phonographic record produces the sound.) 4 claims.

1,023,026. Automobile Light Turner. Ward G. Moxley, Ravena, N. Y. Filed Aug. 26, 1911. Serial No. 646,231. (Levers attaching to steering knuckles afford means of causing motion.) 1 claim.

1,023,045. Automobile Truck. David Elhanna Shipley, Joplin, Mo. Filed Oct. 14 1908. Serial No. 457,731. (Six wheel truck with frame supported on a series of levers) 2 claims.

1,023,050. Taximeter Control. Joseph D Sulsona, New York, N. Y., assignor to Taximeter Control Co., a corporation of New York. Filed Jan. 10, 1910. Serial No 537,208. (Electric signal system operated by taximeter, the entrance of a passenger, and a speed governor.) 12 claims.

1,023,122. Electric Lighting and Engine Starting System. Charles E. Bonine, Philadelphia, Pa. Filed July 7, 1911. Serial No 637,334. (Single unit system with a compound wound motor-generator; ignition through vibrator coils.) 3 claims.

1,023,180. Ignition Apparatus for Hydrocarbon Engines. Milton Tibbetts, Detroit Mich., assignor, by mesne assignments, to Packard Motor Car Company, Detroit, Mich., a Corporation of Michigan. Filed Apr. 17, 1908. Serial No. 427,634. (Means for supporting high tension wires above the cylinders.) 12 claims.

1,023,212. Starting Motor Vehicle Internal Combustion Engines. Charles William Mallins, Liverpool, England. Filed Dec. 2, 1908. Serial No. 465,746. (Pulley clutched to crankshaft and operated from the seat by means of a chain.) 8 claims.

1,023,225. Muffler for Automobiles. Mari Shlosberg, Chicago, Ill., assignor of one-half to McKenzie Cleland, Chicago, Ill Filed June 22, 1911. Serial No. 634,713 (Two cones placed base to base with hole in the diaphragm which separates them fo the passage of the gases.) 2 claims.

1,023,249. Friction Clutch. Nicholas W Gales, Waterloo, Iowa, assignor to William Galloway Company, Waterloo, Iowa. Filed July 27, 1910. Serial No. 574,136. (Mean for gradually engaging the friction su faces.) 6 claims.

1,023,255. Anti-Skidding Device for Automobiles. Edmund Kron, Milwaukee, Wi Filed Feb. 11, 1910. Serial No. 543,35 (Runner mounted so as to be effective on when the wheel sinks into snow or mud 6 claims.

1,023,344. Elastic Tire for Vehicle Whee Charles F. Waldman, Los Angeles, C Filed Aug. 7, 1911. Serial No. 642,836 (No yielding tread supported by radial and agonal helical springs in tension.) 2 clair

1,023,397. Attachment for Carburette Hervey E. Rogers, New London, Co Filed June 15, 1911. Serial No. 633,2 (Device for mixing oxygen and air and sup plying mixture to the carburetter inlet.) claim.

A woman can step directly from her home into her luxurious National closed car.

She finds it clean, warm and comfortable.

She touches one button to start the motor.

A touch on another button turns on the lights.

The entire mechanism of the car is under her immediate control; she need make no exertion or effort; her gown and coat and hands are not brought into contact with anything that may soil them.

In every way the National should appeal to a woman as being many times superior to an electric.

For her comfort and delight we fit the closed cars with a foot mat, umbrella holder, baggage compartment, speaking tubes, vanity box, mirror, flower vases, etc.

Five Models, Improved Series V, $2750 to $3400

Following are a few of the salient features of National cars:

Long Stroke (4 7-8x6) flexible and noiseless Motor with enclosed valves.

Left-Side Drive.

Center Control.

Gray & Davis Electric Starter, easily operated by simply touching a button with foot.

Gray & Davis Dynamo Electric Lighting System.

Bosch dual double Magneto.

12-inch Turkish Upholstery.

Electric Horn.

Adequate Baggage-carrying Compartment concealed in body but easily accessible.

Tire pump, integral part of the motor. Inflates a tire in three minutes.

128-inch Wheelbase.

Adjustable, ventilating and rain vision Windshield.

Multiple jet Carburetor.

Hoffecker steady-hand Speedometer.

Tire Carrier in rear.

Full-floating Rear Axle.

Easy-riding qualities unexcelled.

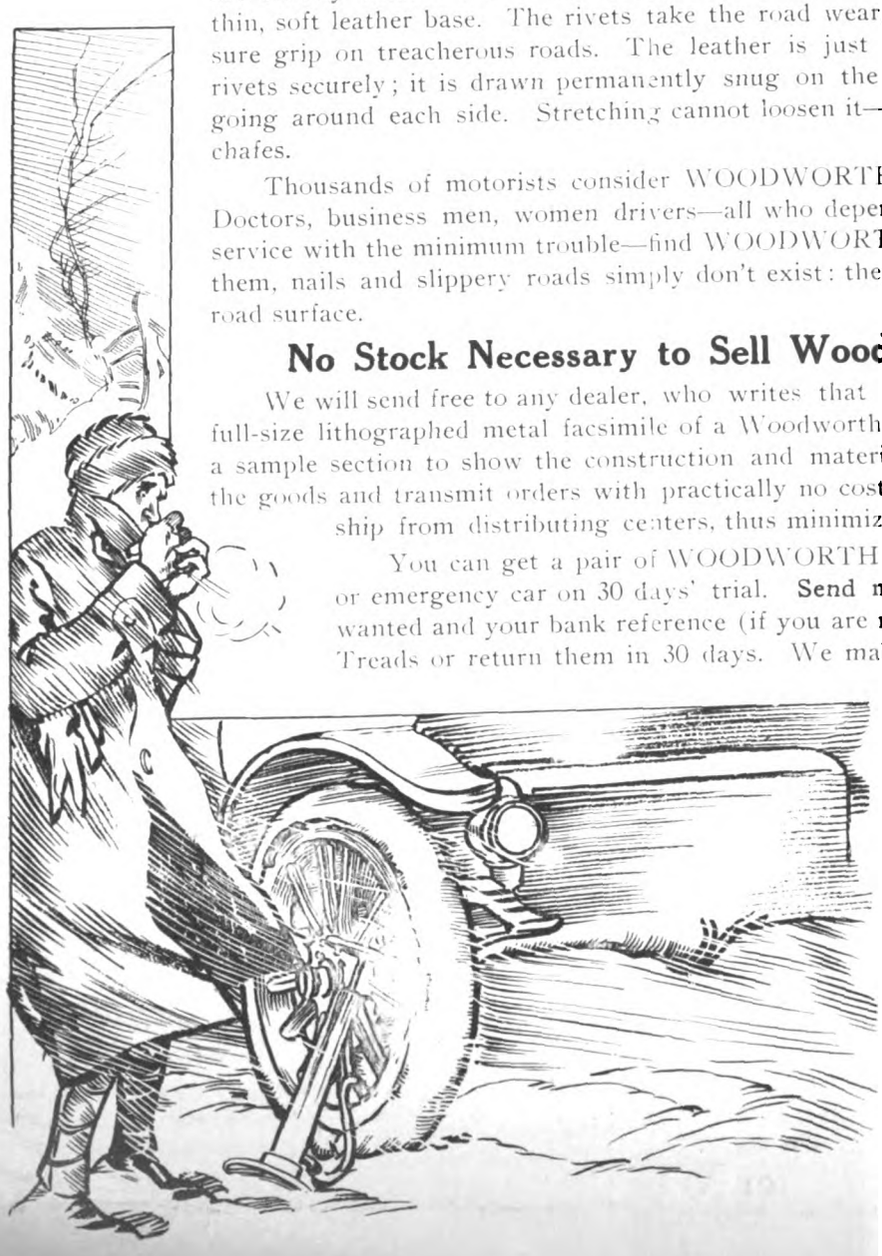
THE SALE YOU LIKE BEST

Is the One That Brings a "Thank You!" and a Repeat Order From Your Customer

THAT is the kind that hundreds of dealers are making now, with the tire coverings that prevent both skidding and punctures, yet do it **without** risk of heating and chafing the rubber!

Woodworth Treads



are exactly what a tire cover should be—a tread or surface of steel rivets in a thin, soft leather base. The rivets take the road wear, arrest nails, and afford a sure grip on treacherous roads. The leather is just thick enough to hold the rivets securely; it is drawn permanently snug on the tire by stiff side springs going around each side. Stretching cannot loosen it—and a **snug** covering never chafes.

Thousands of motorists consider WOODWORTH TREADS indispensable. Doctors, business men, women drivers—all who depend on regular and punctual service with the minimum trouble—find WOODWORTH TREADS a boon. For them, nails and slippery roads simply don't exist: they are always ready for any road surface.

No Stock Necessary to Sell Woodworth Treads

We will send free to any dealer, who writes that he will pay expressage, a full-size lithographed metal facsimile of a Woodworth Tread, with literature and a sample section to show the construction and materials. Thus you can show the goods and transmit orders with practically no cost to offset your profit. We ship from distributing centers, thus minimizing express charges.

You can get a pair of WOODWORTH TREADS for your renting or emergency car on 30 days' trial. **Send no money**—simply the size wanted and your bank reference (if you are not rated)—and pay for the Treads or return them in 30 days. We make this offer to enable you to tell your customers from experience what WOODWORTH TREADS will do, and how totally different they are from other so-called "protectors."

We guarantee WOODWORTH TREADS to both dealer and user. But we can't tell all about them here. Write today for full particulars of their construction and use, and a sample section of the Tread showing how it is built to do exactly what we say.

Elyria-Dean
TRADE MARK

REXO HORN
Electric Warning Signal
GUARANTEED

$8.00

The Rexo Adds Value to Motor Cars

The time has really come when the accessories that make up the equipment of motor cars materially influence the buyers of automobiles. Every prospective purchaser looks carefully and critically at the little things that either increase or lessen the convenience, the safety and the satisfaction to be derived from the use of a car.

Manufacturers have adopted the Rexo as standard equipment because it is recognized almost universally by car buyers as the most simple, most trouble-proof, most effective low-priced horn on the market.

Rexo Horn Advantages

This electric warning signal operates from any 6-volt battery and the current required is small, so that maintenance is very low.

It gives a clear, loud, abrupt signal, which is instantly responsive to a touch of the button, conveniently located on the steering wheel or other handy place. Its operation is equally as positive in winter as in summer, as there is no oil or grease to congeal.

The Rexo requires no care or attention, except perhaps once a year to overcome the season's wear. The slight adjustment necessary is easily made with an ordinary screwdriver.

Rexo qualities have made it the most popular and widely-used single tone electric horn on the market.

We also manufacture the Tuto, a very high-grade, two-tone horn, at $25, and the Tutoette, a smaller two-tone horn, which sells for $17.50.

Elyria-Dean
TRADE MARK

Elyria-Dean Speedometer

Simple and Always Accurate

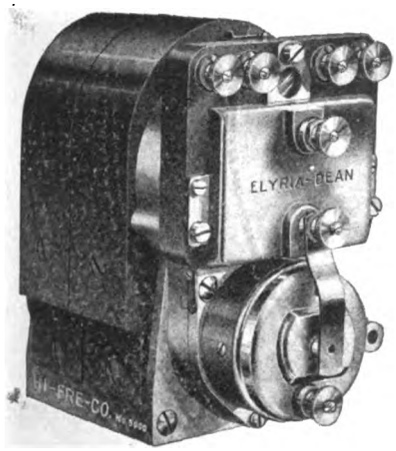
The Elyria-Dean Speedometer has the most modern features of any speed measuring device on the market.

It has real speedometer value, easy reading, steady hand, permanent accuracy, lasting strength, neat design and handsome finish.

The dial is black with white markings; the case is beautifully finished in baked black enamel with nickel trimmings.

The hand is steady and shows the speed at a glance by its position. No need of laboriously deciphering the figures or markings as in other speedometers.

The cup is shaped so that a long scale of uniform division is obtained direct. No need to guess at the reading or doctor the scale.



The Odometer—Geneva type—is exceptionally reliable. Trip scale reset to the tenth mile, which **facilitates following guide book markings.**

It always adds mileage whether the car goes forward or backward, or whether shaft is driven from right or left hand wheel.

The Elyria-Dean Speedometer operates on the unvarying principle of direct centrifugal force. No compensating gears, springs or other parts to hamper or reduce **accuracy.**

The accuracy is unaffected by weather conditions. It registers the same in winter and summer, in rain or in shine. No regulation or compensation required.

This elegant instrument is the proper equipment for the highest-priced and most luxurious motor cars. See it and other Elyria-Dean Products at the Chicago Show.

Elyria-Dean Ignition System

This is the new system which has created such favorable results on modern power plants. It gives a new breath of life and extra "ginger," which is so much sought for by the car purchaser.

The high frequency spark differs from all other ignition sparks, as it is oscillatory in character, 5,000,000 to 1,000,000 cycles per second.

It ignites the gas in a different manner, by ionizing, embracing a larger volume and giving more rapid and complete combustion, even of poor mixture.

Wide spark plug gaps are permissible, 1-16 to 3-32 inch and the disruptive action of the spark prevents fouling of the plugs. Under average conditions, plugs never have to be removed, unless for mechanical breakage.

High cylinder pressures have less effect on this spark than on the other ignition sparks.

It allows the lowest of motor speeds without missing—running on the magneto current.

"Self-starters" are made successful on magneto ignition, as effective sparks are obtained at very low speeds, below 50 R. P. M.

All wiring carries low voltage currents, as the little resonator coils at the plugs step-up the pressure just where it is used. This obviates leakages and the maintaining of high insulation in the magneto, switch and connecting wiring.

It is a perfect product, the outgrowth of the many thousands of successful High Frequency Systems which have been marketed by the High Frequency Ignition Coil Co., of Los Angeles. Many of these systems have been in use for five or six years, and are still giving satisfactory service.

The big tire business of the future will be Dunlop business

The GENUINE DUNLOP (Straight Side) TIRE

is destined to become the universal tire

Car owners, dealers and manufacturers are everywhere turning to the Genuine Dunlop Straight Side Tire.

The 600% increase which has taken place in our Dunlop sales during the past year is an indication of the certainty of this trend.

The trade in general have come to realize what tire experts have long known—that the Dunlop is the ideal type of motor car tire.

It is the easiest tire in the world to put on or take off and it is absolutely guaranteed against rim-cutting during the life of the tire.

It possesses the superior strength and durability to be found only in four-factory co-operatively-built United States Tires. In fact it possesses every point of advantage to be found in any other tire, and in addition has exclusive advantages to be found in no other tire.

But bear in mind, the Genuine Dunlop Straight Side Tire is made only by the

UNITED STATES TIRE COMPANY

Makers of the famous Nobby and Chain Tread Tires (made in three styles, including the Dunlop)

NOTE: As always the guarantee of the United States Tire Company attaches to its tires when filled with air at the recommended pressure only

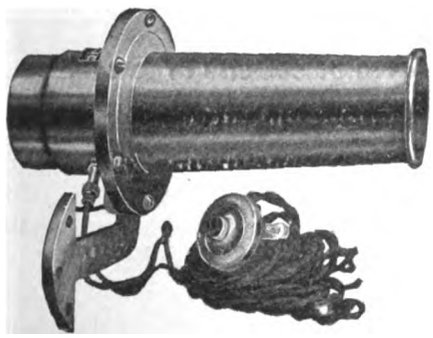
NEWTONE SUPERIOR

$10  **$10**

The First Efficient Motor Horn to Sell at a Popular Price

A warning note, pleasing yet penetrating, with wonderful carrying power



We make a better horn for less money than can possibly be produced elsewhere

WHY?

We are the largest Auto Horn Makers in the World.
We supply over 75 per cent. of the trade with different types of horn.
Our factory is the largest. Our machinery is of the best.
Our facilities in every way are superior

In the past eight years we have made and sold over ***One million two hundred and fifty thousand horns*** of different types and sizes.
This year we will produce over ***One hundred thousand "Newtone" horns*** alone.

THE JUNIOR LONG HORN

Is the Biggest Eleven Dollars Worth Ever Put On A Car

$11

That's What our DEALERS say.

That's what YOU will say after you have been demonstrating and selling it.

If you will take up our proposition, we will show you a short cut to quick and profitable sales.

This Junior Long Horn

is like its big brother in all but price and size.

Operates mechanically by hand or elbow pressure.

Has a loud, commanding voice.

Volume of sound regulated by pressure.

No batteries---no switches.

Cannot break down or wear out.

Never varies in volume of sound.

Installed in five minutes.

Doesn't cost a cent to operate.

Retail price $11.

Your discount worth knowing about.

Now, it's up to you to show your trade the Long Horn—a demonstration means a sale to every one who knows the trouble, expense and inefficiency of even the highest priced signals that are not mechanical. Write today.

Buffalo Electrics

The Best of America

SINGLE REDUCTION DIRECT SHAFT DRIVE

THERE is no finer piece of mechanism than the human body. All mechanics are based on a study of how the human body does things.

The power plant and driving mechanism of every good motor car should be arranged as the athlete arranges his members—crouched, waiting for the starter's signal—in a straight line.

Think of eager get-away; think of efficient running; extra effort—as when you speed up a little, or climb a hill. Single Reduction Direct Shaft Drive, especially the kind in Buffalo Electrics, acts just as the human body would act under similar conditions. We obtain even a faster get-away than gasoline cars.

Another advantage of Buffalo Electric Shaft Drive is its economy in current used. There is no noise. Every strain balances and works to your benefit.

BUFFALO ELECTRIC VEHICLE CO.

Factory and General Offices, Main Street

BUFFALO, N. Y.

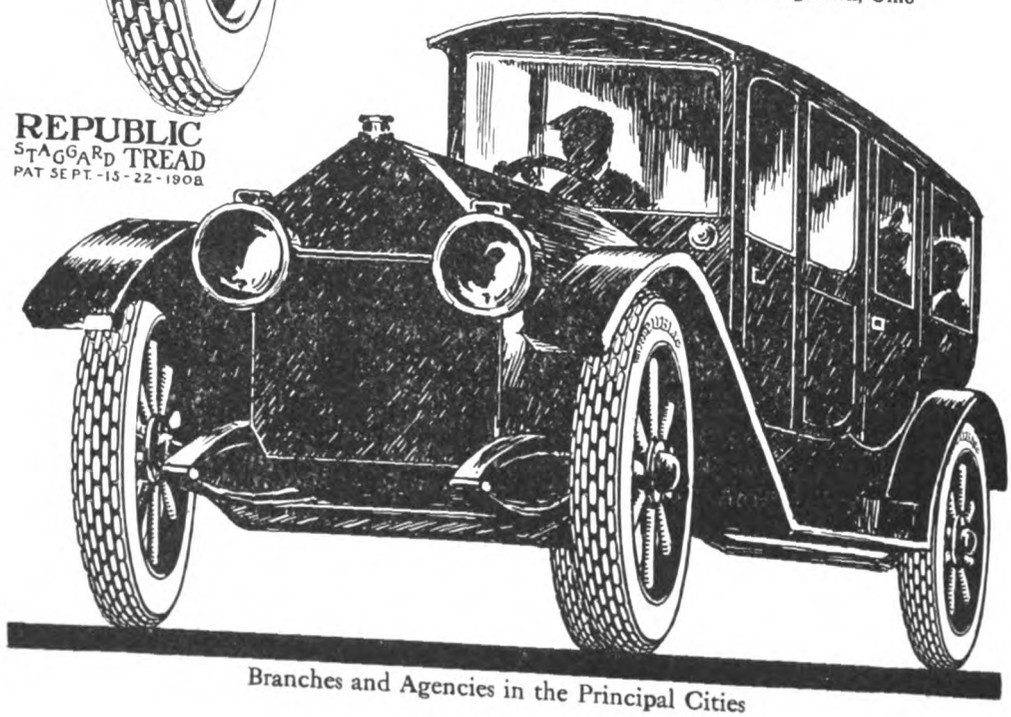
REPUBLIC STAGGARD TREAD TIRES



Limousines demand sturdy, skid-proof tires

The extra weight and top-heaviness of the average enclosed car put an unusual strain on tires. The tending to skid is more pronounced than in any other type of car.

This year, equip your enclosed car with the original, effective non-skid tire. You can feel safer on wet, slippery pavements, and you can rest assured that the extra thickness of the Staggard Tread will yield you extra mileage and freedom from tire troubles.

Electrically Lighted

AMERICAN UNDERSLUNG

Electrically Started

The "American Tourist" (Type 34-A) $2,350 Complete

Comfort!

YOU can drive an "American Underslung" over a series of two-by-four timbers at fifteen miles an hour and the plane of the underslung frame will not be perceptibly disturbed.

The underslung construction permits greater riding ease than that found in any other automobile. In estimating the riding comfort of a car, not only the jolts and jars of the road must be considered but also those of the car itself.

The "American Underslung" design permits no sidesway—and no shocks on the frame. You can tour one third more miles in a day with less fatigue. And you can cover the same distance at from 10 to 20 miles greater speed.

The big wheels and the peculiar spring suspension adaptable only to the underslung design increase many times the fun and joy of cross country touring.

Compare the stability of a pail of water carried above the head and that by the side. This properly contrasts underslung design with that of the conventional overhung.

Write us today for our interesting book, "The Advantages of Underslung Construction."

The "American Scout" - - - $1,475 Complete

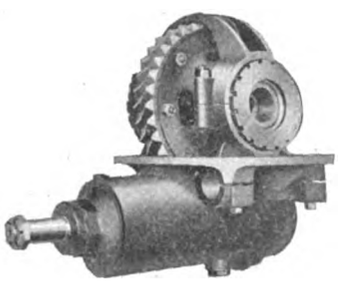
American American



American Axles

Having Least Friction Give Most Power

Whether your motive power is electricity or gasoline, your problem is one of power transmission rather than power creation. *American Axles* least obstruct the flow of power from your motor to your wheels.

After an electric car leaves the garage, no further addition can be made to the charge which its batteries carry. *American Axles* because of their minimum of friction, perfect construction and highest quality workmanship, will give you the maximum mileage of which that charge is capable.

Our position in this industry allows us, we believe to speak with authority to every prospective car owner on this important subject. We designed and built the first Bevel-Drive Axle used by an electric car in America. Today 80 per cent. of the electrics in this country use *American Axles*.

Only in *American Axles* can you have the choice between the highest developed type of bevel gears and the famous Lanchester-Daimler Worm Drive.

We hold the exclusive American rights as axle manufacturers of the Lanchester-Daimler Worm Gearing, through the Warner Gear Co., of Muncie, Ind.

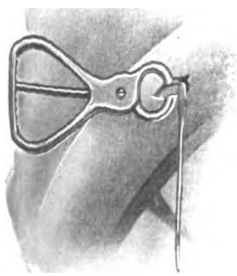
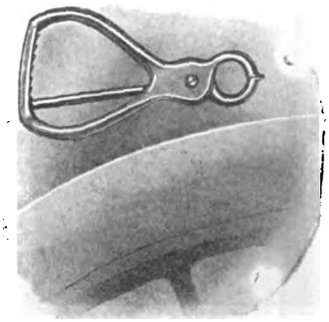
GILMER TIRE REPAIR PLIERS

Dealers---If You Sell Tires, Accessories, or Complete Cars ---Read This Advertisement

A popular and fast selling accessory such as GILMER TIRE REPAIR PLIERS means everything to the wide-awake DEALER. Our product is advertised extensively in all leading AUTOMOBILE publications. Inside of twelve months we have created a demand which taxes our present capacity of 10,000 complete sets per month. To date we have barely scraped the surface; this is proven by the fact that over 50 per cent. of our orders come from territories wherein we have already shipped our PLIERS.



Every Motorist is a possible buyer. There is no room for doubt on a GILMER PLIER sale. They actually protect his pocketbook, for in eliminating a large part of his TIRE EXPENSE we remove the one serious objection to motoring.



IF YOU SELL GILMER TIRE REPAIR PLIERS they will put you in touch with hundreds of new customers. Your only effort is to DELIVER THE GOODS. We will send the buyers to you, not an occasional chance sale but a steady stream of live ones, the kind that make for GOOD BUSINESS.

Don't Worry About Your Profit---Gilmer Dealers Are Making Money Fast

The retail price of $1 for Pliers and Cleaner means quick sales. No one will hesitate on price—for you can show them in one minute that the investment will be saved twice over in the first week.

If you are not visiting the New York or Chicago Shows send for DEALER proposition. Our selling plan-via-the DEALER was conceived with the idea of making GILMER PLIERS the leading accessory of the industry. We will guarantee to show you a modern money making connection—plus—an intelligent way to get in close touch with ALL the CAR OWNERS in your territory.

The Cole Franchise is the same to you as money in the bank

No matter what car you represent, you owe it to yourself to investigate the meaning and significance of this big progressive new idea. We will merely hint here that it means the final solution of the **"dealer and factory problem."**

How? That is what we will explain to you, if you so desire.

When a distributor or a dealer "hooks up with **Cole,"** he does not get a mere piece of paper; he gets a gilt-edged salable **franchise** worth money to him the instant that the document is signed.

This franchise represents a considerable commercial value, and is good as collateral at the bank.

These Cole Franchises are not distributed promiscuously.

When we issue a Cole Franchise, we realize that we are engaged in a serious procedure—one that will affect us and you for a period of years. We assume certain serious responsibilities. It is not a mere incident in the day's work. We are as careful about the issuance of the Cole Franchise, as we would be about signing any other official document.

But, at that, the fact that the Cole Motor Car Company is about to again enlarge its production, might make it possible for you to obtain the Cole Franchise in your territory. We know you would not impose on good nature by opening negotiations with us unless you were able to do justice to a big progressive marketing enterprise.

We will take it for granted that you know the type of representation we must have, and will explain, if you so desire, just what is signified by the term **Cole Co-operative Franchise.**

Granted that you are a real live dealer with real live ambition to succeed, we will soon get the coupon from you. Here it is. Fill it out, and without the slightest delay or obligation on your part, mail it in.

The Gearless Transmission!

For ten years this simple, reliable car has been growing steadily in popularity. Today it is found giving perfect service in every section of the country. It offers advantages which are impossible in the gear car—and these advantages mean the very utmost in service and satisfaction for you.

A Cartercar Will Save ⅓ - ½ Your Tire Bills!

There are no jerks or jars in starting or stopping—and this means that much of the hardest wear on the tires is eliminated. Tires are the big item in the upkeep expense of the ordinary car.

And you know that this smooth, easy running must mean remarkable comfort for the passengers. Then, too, the very deep upholstering and resilient springs make the Cartercar as comfortable as any car can possibly be.

Think of Climbing 50% Hills!

The great economy of power secured by the gearless transmission makes it possible for the Cartercar to easily climb the steepest hills and to simply play through deep mud and sand. No gear car can offer such service.

Another advantage is the unlimited speeds. And all with a simple one lever control. Compare this with the four of the gear car.

Of course, all Cartercars are Electrically Started and Lighted. Both of these operations are controlled by a little knob on the front of the driver's seat. This and all other equipment is included in the regular prices.

Do you want a car for dependable service—all the time? Then consider the exclusive advantages offered by the Cartercar. Catalogue now ready.

Tire bill payers!

You have demanded a vise-like rim-grip - with no cutting or breaking above the rim-and here it is

Diamond Vitalized Rubber {No Clinch} Tires

with Perfect 3-Point Rim Contact

We said to our Engineers: "You must build us a tire with perfect 3-point rim contact."

They did—and now we offer you a sane, sensible, No-Clinch tire that will appeal to you, as a hard-headed, shrewd tire buyer—a man who insists on easy riding comfort and good liberal mileage.

Each point of rim contact in a tire is a point of support. Where the points of contact are not perfect, undue pressure is brought to bear at an unsupported point of the tire.

Then what happens?

The result is a terrific strain on the tire that results in rim troubles, breaking above the bead and separation of the tread from the carcass.

All this is overcome in the "Diamond" because the three points of rim contact are absolutely mechanically perfect—the annealed steel cabled wire bead holds with a vise-like rim-grip.

This is only one Diamond advantage.

You get additional More Mileage advantage without extra expense in the Diamond Vitalized Rubber—a scientific combination of pure, lusty, young rubber and a toughening compound—nothing inferior in rubber, fabric or workmanship—the No-Pinch Safety Flap inner tube protector—and, if you desire, the now famous Safety (Squeegee) Tread--made to fit all types of rims.

So this time specify "Diamonds"—you can get them at any of the

25,000 Diamond Dealers
always at your Service

How About Dead Stock in Spark Plugs?

You may have such a losing investment—Plenty of dealers have.

It's the logical result of defective products—many brands that do not give service, even if you *do* sell them on the maker's word.

DEALERS

We are going to help you to sell Mezger Soot Proof Spark Plugs by giving your trade the best plug on the market — and by giving you advertising service on a scale never attempted by any manufacturer in this line.

Mezger Soot Proof Spark Plugs are made by one of the oldest spark plug makers in America.

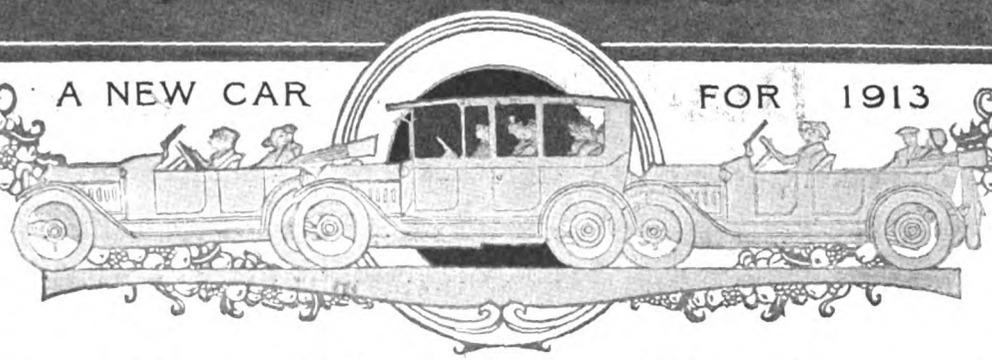
They have stood the test of years —long, hard and consistent service.

Through their self advertising they have multiplied into

Millions Now in Service

and they are giving perfect satisfaction to tens of thousands of motorists—simply because they cannot short circuit, leak or break down.

Your trade can pay more for Spark Plugs, but no matter what the price, they cannot buy more uninterrupted service or longer life.



We are going to prove that it will be to your advantage to handle Mezger Soot Proof Spark Plugs exclusively.

Write today for our proposition. Get our booklet telling why these plugs have made and held a reputation second to none.

CAPACITY

GURNEY

ENDURANCE

No ball bearing on the market today has the capacity and endurance of the

Gurney Ball Bearing

THIS advertisement is the first of a series, the object of which is to familiarize the automobile industry with the fact that no other bearing ever dreamed of even approaches the Gurney Ball Bearing in efficiency. Getting down more closely to details we say here, with the hope that you will insist upon our proving the assertion, that no other ball bearing in the world possesses these four essentials—(without any one of which no bearing can compare, even, with the Gurney Ball Bearing)—

Full complement of balls;
Solid one-piece separator;
Uninterrupted raceways;
Full depth of raceways to resist thrust.

The reason for the superiority of Gurney Ball Bearings lies in the fact that they are the only bearings which possess uniform raceways of the right contour. It is an acknowledged fact that no ball bearing is better than its raceway.

Gurney raceways are formed by a highly specialized method that produces a degree of accuracy in size, concentricity and race contour not realized by any other makers.

Other manufacturers can buy just as good steel and just as good balls but they can neither produce the perfect raceways that we produce, nor can they assemble, with as many balls, a complete bearing with a single piece separator, as we do, without slotting the raceway. Hence our position as producers of the most efficient ball bearing on the market.

It will give us the greatest pleasure to prove all these claims to your entire satisfaction. Wouldn't you like to test out these bearings yourself?

GURNEY BALL BEARING CO., Jamestown, New York

No-Rim-Cut Tires—10% Oversize

A Story Ages Old

When one man does one thing better than anyone else, the world always finds him out.

That's all there is to the Goodyear story, now on a million tongues.

Make no mistake. One tire has not outsold all others without a reason for it.

And the hundreds of thousands who have come to this new type are not men to be deceived.

The Story Is This

Men sought a way to minimize the cost of tire upkeep.

Fourteen years ago the Goodyear people started out to find it.

The way was hard, the path unblazed, progress very slow. Five years after starting we made scarcely more than one per cent of the tires.

Three of our rivals at that time made 70 times as many.

Six years after starting our cost of replacement, under our warrant, ran 1.43 per cent. And that, in a most sensational way, broke all the records of Tiredom.

It was then—in 1906—that men began to recognize the worth of Goodyear tires.

Then Came Two Great Inventions

Then the Goodyear experts brought out a new way of building tires. It secured equal tension on every inch of the fabric. We control the patents on it.

They also brought out the No-Rim-Cut type, which is also controlled by our patents.

That ended rim-cutting, which destroys about 23 per cent of all old-type tires.

Then these tires were made 10 per cent oversize. And that, with the average car, added 25 per cent to the tire mileage.

These features together gave No-Rim-Cut tires an advantage which proved irresistible.

Flood-Like Demand

From that time on Goodyear sales doubled every year.

Then they more than doubled. Last year's increase was 125 per cent, though orders for 400,000 tires had to go unfilled.

Long ago these tires outsold every other tire in existence. Now this year's output, in all probability, will exceed two million tires

Nearly half of all the new cars this year will go to their buyers with Goodyear equipment.

Odometers Did It

The greatest jump in Goodyear sales came with the vogue of odometers.

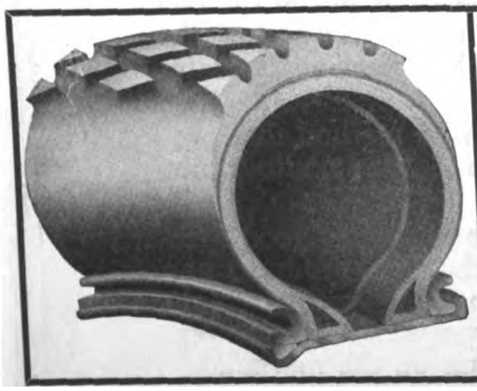
Men used to buy tires by guesswork—by old-time reputation. They rarely made actual comparisons.

But most cars now have mileage recorders. Men buy their tires by records.

As a result, our output today is seven times larger than two years ago.

Heed What Users Say

Some hundreds of thousands of motor cars now are running on Goodyear tires.



Wherever you look you will find men who know them—men who know their records. Ask some of those men to reveal their comparisons.

Common sense tells you that tires which can't rim-cut—oversize tires—must be better than others.

Common sense says that tires which **outsell** must **excel** in some ways.

Ask users if they do that. Then judge for yourself if it pays these people to insist on No-Rim-Cut tires.

Ask us for the Goodyear Tire Book—14th-year edition. It tells all known ways to economize on tires.

GOODYEAR

AKRON, OHIO

No-Rim-Cut Tires

With or Without Non-Skid Treads

Here's a Winter Tread which experts consider the very last word in non-skids.

A double-thick tread, made of very tough rubber, immensely enduring.

Deep-cut, sharp-cut blocks—countless edges and angles—insuring a bulldog grip.

Blocks which meet at the base, so the strains are distributed just as with smooth-tread tires.

Have you ever seen another non-skid which meets these essentials?

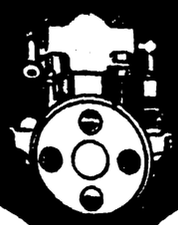
ERGON MOTORS

Power—Durability—Simplicity—Accessibility

While Ergon motors are adaptable either to commercial or pleasure vehicle usage, especial attention has been paid, in their design, to the commercial end of the industry. In this branch of the automobile industry it is absolutely essential that a motor must be remarkably simple and accessible as well as powerful. For this reason Ergon motors have been designed not only for power and durability but for simplicity and accessibility as well.



Ergon motors are four cylinder, four cycle, long stroke, 4⅜ x 6 inches, water cooled, L-head, with cylinders cast in pairs. They are of the unit power plant type, with Brown-Lipe dry plate clutch, and three speed selective transmission. Renold silent chain drive replaces timing gears and provision has been made for any one of several electric and pneumatic starters. Timken bearings are used in the transmission and the clutch is supported on F. & S. bearings.

Won't you give us the opportunity of proving out this motor to your personal satisfaction?

HAZARD MOTOR MANUFACTURING COMPANY

ROCHESTER, NEW YORK

JENCICK

Learn why Jencick standards of design and construction must produce engines that are working as usual years after cheaper motors are relegated to the scrap pile.

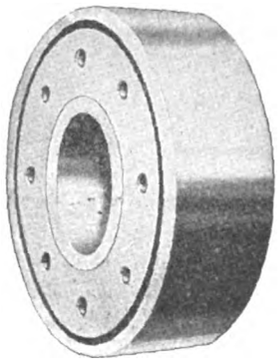
We have information of importance for every truck designer, covering in detail points of Jencick engine superiority, and the story we have to tell giving reasons for higher cost of production, will throw a new light on what an engine ought to be and what it frequently is not.

Design is important and this feature alone marks our product the last word in modern engine construction.

Jencick Motors are designed by Stephen Jencick, whose European education with DeDion and Daimler covers a long period of years. It is this experience, coupled with American training, that has made him a master of design.

But furthermore you ought to know the reasons why Jencick Motors have manganese bronze bases instead of cast iron or aluminum—Krupp chrome nickel steel crank shafts instead of ordinary carbon or nickel steel—close grained semi-steel cylinders and pistons instead of the prevailing cast iron construction.

Get the comparative details showing Jencick superiority in the comparisons of elastic limit, tensile strength, elongation and reduction.



These and many other points of technical information will prove to you, Mr. Truck Engineer, just why Jencick engines are built on an efficiency and service basis not possible with makers who work on the keep down cost of production plan.

JENCICK MOTOR CORPORATION, ROCHESTER

Hyatt Quiet Bearings

Hyatt Flexible Rollers will not crush under load because of their being hollow. The strength of these rollers is dependent upon the section of the steel out of which it is formed as well as the elastic limit of that material

Every size bearing is capable of carrying a certain load at a certain speed. If the carrying capacity is greatly overreached, the bearing cannot be depended upon to give permanent satisfaction. Any other automobile member subjected to excessive stress will fail under similar conditions. It is simply a matter of proper engineering.

When reasonably well mounted and operated under its proper duty, the Hyatt Roller Bearing lends itself to practical conditions as no other can. When subjected to faulty mounting—imperfect alignment—unreasonable abuse—and over-loading, no other bearing is even comparable.

Comparison proves the dominating quality of the KisselKar

COMPARE the KisselKar with cars of highest price and best reputation, and let your comparisons be on **quality,** not on price.

Such comparison is advantageous to the KisselKar because the KisselKar, beyond doubt, embraces all the quality that modern engineering, modern factory facilities and high standards **can** put into a car.

It is the maximum product of modern motor car construction, produced by a skilled organization with every facility for economy production, and with no dead weight costs to go into the prices.

Every dollar of KisselKar price represents quality in the car—and no car is better constructed, and few so liberally designed as the KisselKar.

In appearance the KisselKar is the car of superb distinction.

It offers the widest possible range of throttle control.

It will drive on high (fourth geared-up-speed) as fast or slow as you need going in all ordinary driving.

The tonneaus are roomier, the seats deeper than in any other car.

In every refinement of appointment and finish, the KisselKar meets the highest standard.

1913's TRADE SENSATION!!!

BOYCE MOTOMETER

PAT'S PEND'G

"MORE NECESSARY THAN A SPEED INDICATOR"

Know the Exact Heat of Your Motor While Driving!

The MOTOMETER is a watch-like instrument fitted to any radiator cap and protects the motor from damage caused by improper lubrication, overheating, defective cooling, etc. By means of a red fluid indicator, **visible from the seat** day or night, it warns

WHEN THE RADIATOR NEEDS WATER.

WHEN THE OIL SUPPLY IS INSUFFICIENT.

It tells whatever excessive heat tells—a broken water pump, a clogged oil pipe, a broken fan belt, etc., also when the motor and water jackets are in danger of freezing—and warns before the damage is done!

Attached as an ornament the MOTOMETER registers the inside temperature of the radiator. It gives a feeling of security to know when the car is operating correctly. The constant rise and fall of the indicating fluid, under varying road conditions, is more interesting and instructive to watch than a speed indicator.

Finished in black enamel with gold plated or nickel rims. If your dealer cannot supply you, send check or money order and we will express an instrument prepaid. Sooner or later you will drive a MOTOMETER equipped car. Enjoy it now.

DEALERS—The MOTOMETER sells at a price that means no dead stock. Act at once!

Prest-O-Starter

Starts your engine (old or new) quickly and easily in coldest weather

For Four Cylinders $20

For Six Cylinders $25

$1.50 extra for two-way valve necessary when the same tank is used for both starting and lighting.

Here's a starter that adds practically no weight to your car, is perfectly simple and is as durable as the engine itself. Easily applied to any engine, old or new, very economical in the use of gas, and requires no expert repairing.

How Prest-O-Starter Works

The principle of starting a motor with Prest-O-Starter is the same as "starting on compression." A measure of acetylene, at low pressure, is pumped from your Prest-O-Lite into the cylinders.

Touch your spark—your engine starts.

Unlike "gasoline priming," it is not affected by heat or cold. It is certain.

In cool weather, by opening a valve on the dash, you can feed gas at low pressure into the intake manifold. This allows your engine to run on acetylene until it is warm enough to run on gasoline.

If the Prest-O-Starter did no more than prime your engine in this way during cold weather, this convenience would be well worth the price.

But Prest-O-Starter is more than a primer. When installed properly, it will start your engine, summer or winter, almost invariably without recourse to the crank.

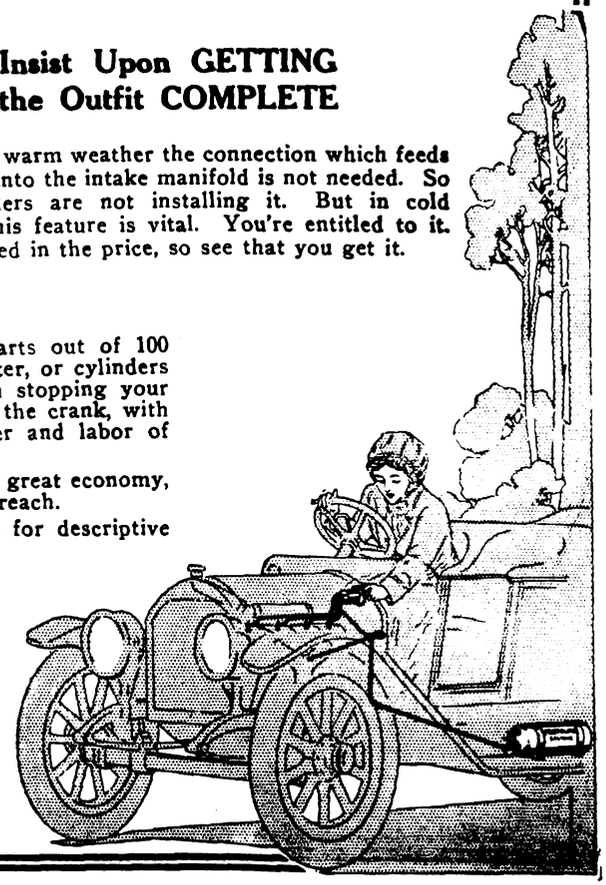
Make Sure Your Starter Is Installed CORRECTLY—Look It Over

The Prest-O-Starter is easy to install correctly. In fact, it's so very easy to install that some good factories and garages install it with utter carelessness, overlooking the one or two simple features vital to success in operation. Fortunately this is an easy matter for the car owner to correct, even if he isn't a mechanic.

Our literature tells you exactly how the Prest-O-Starter is installed, and how to adjust it. Anyone can give it the slight attention it may need or quickly tell a dealer where the trouble lies.

Every Prest-O-Starter is sold with the assurance of satisfactory service. The entire Prest-O-Lite Organization is back of every one. If you have any trouble, report it to us or to our nearest branch. We'll wipe it out quickly.

Insist Upon GETTING the Outfit COMPLETE



During warm weather the connection which feeds acetylene into the intake manifold is not needed. So some dealers are not installing it. But in cold weather this feature is vital. You're entitled to it. It's included in the price, so see that you get it.

Now—More Than Ever—You Need One

Your Prest-O-Starter, properly installed will average better than 95 starts out of 100 attempts. The few failures are caused by your motor stopping on dead center, or cylinders filled with burnt gas. Both of these conditions can be easily avoided when stopping your motor. But should either or both happen, an eighth or a quarter turn of the crank, with the switch at neutral, will remedy the trouble at once, with all the danger and labor of cranking eliminated.

Rest assured that no other starter can give you as high efficiency with as great economy, durability and freedom from mechanical trouble. The price is within easy reach.

Get in touch with any of our branches—or your dealer—or write us for descriptive literature

Remy Magnetos

We Equip 400 Motor Cars Daily

THIS is not the record of a single day. This is a *daily average*—for four months ending with January—of cars newly equipped with Remy Magnetos. These figures have never been approached by any other manufacturer.

It is convincing, statistical evidence that the Remy Electric Company is the world's greatest manufacturer of magnetos; that Remy magnetos are greatest in demand by manufacturers, dealers and owners; that good magnetos combined with our "Ignition Service For Owners" make Remys absolutely essential to motoring satisfaction.

Do not worry along with an unsatisfactory, troublesome magneto. Buy a Remy; it will rejuvenate your car.

Remember that the Remy Electric Company is the pioneer manufacturer of magnetos in this country—one of the first in the world; *that more Remys are being used on 1913 cars than all other makes combined.*

We originated "Ignition service." We have more than 50 branches and service stations, stretching from Montreal to Los Angeles; from Vancouver to Jacksonville; and from far off Calgary to El Paso, Texas. In these stations our factory trained experts and exclusive Remy testing apparatus are at your service.

For a postal we will send you a book filled with interesting magneto information—told in a manner the layman will understand and enjoy,

Exchange your old magneto, any make, for a new 1913 Remy; it will cost you practically no more than repairs on your present ignition system.

Every Reliable Accessory Dealer

should have our attractive proposition on

The FEPS CARBURETOR

You've heard so much about wonderful carburetors that you're probably case-hardened in skepticism. We submit, however, these two series of facts for your consideration.

FIRST. The Carburetor is today the most imperfect part of the automobile, and far behind, in efficiency, every other accessory. There's real need of a real carburetor.

SECOND. The Feps Carburetor splendidly meets that need. It involves an entirely new principle of auxiliary air supply, producing a marvelous increase in flexibility; an absolutely perfect mixture at all speeds, with an increase of 25% to 50% in miles per gallon of fuel on any car. It contains no springs, no balls, no cams, no reeds, and all adjustments once made are permanent. It gives a perfect mixture with any grade of gasoline and is unaffected by altitude, weather conditions or change of temperature. It also embodies a never-failing quick-starting device.

The first fact you cannot dispute, the second you probably will, until you test out the Feps at our risk. Get in line with the Feps now for increased business and profit.

Prevention of Industrial Accidents

Is one of the most serious problems confronting Employers of Labor to-day

Employers are eager to adopt all possible means for the *Prevention of Industrial Accidents,* but the magnitude of present day enterprises deprive the executive heads of the intimate knowledge of conditions necessary to effective improvement.

THE most effective service for the prevention of accidents, the result of twenty years practical experience, is offered its policy holders without charge by

The Travelers Insurance Company

Hartford, Conn.

TRAVELERS service provides systematic and minute investigation of plants and equipment; advice as to the elimination of danger points, installation of efficient and economic safety devices, handling and storage of material, factory methods and supervision.

Inspections are made by specialists where needed and by general inspectors acquainted with the work of all departments of a plant and of general constructive methods. During 1912, The Travelers made 142,000 inspections involving 850,000 recommendations for improvement of working conditions.

The Pennsylvania Railroad after largely reducing the number of serious accidents to their shop employees stated "We should fail in our duty if we did not give The Travelers Insurance Company credit for the systematic methods now in use over the Pennsylvania lines."

A years subscription to the ***Travelers Standard*** a monthly devoted to Safety Engineering and the Prevention of Accidents, will be sent on request by filling in the coupon below.

MODEL "K" TRUCK

Capacity One Ton

A happy medium between the heavy expensive truck and the light delivery car

The motor is four cylinder, 30 H. P., water cooled, built as a unit, with selective three speed transmission, multiple disc clutch and fly wheel, all enclosed in an oil tight aluminum housing and hung with three point suspension. The axles are Vanadium Steel fitted with large roller bearings, sprockets are heavy and fitted with 1¼ inch roller chains—wheels are 36 x 3½ front and rear.

Our new factory will greatly increase our output for 1913. and we are offering an exceptional opportunity to live dealers

Eleven World's Records Beaten on Rudge-Whitworth Detachable Wire Wheels

This wheel is shown after two terrific speed contests. Note the condition of the tire.

Every Rudge-Whitworth Wire Wheel is equipped with the Houk Quick Detachable Rim

Considering the fact that more than 20 makes of cars were exhibited at the New York and Chicago Shows, this year, carrying wire wheels as regular equipment—considering the further fact that more than 30 of the leading manufacturers of the country will use wire wheels on their product this year—(and probably double that number in 1914)—the wonderful showing of Hemery in acquiring 11 new world's speed records on Rudge-Whitworth wire wheels becomes of secondary importance to American manufacturers and dealers.

And, still, an analysis of the table of records on the opposite page is extremely interesting in showing, practically, the correctness of the theory of the wire wheel invasion. If Rudge-Whitworth wire wheels can add life to racing tires and speed to speed creations where driving and abuse are at the maximum extreme always, then surely Rudge-Whitworth wire wheel efficiency for general pleasure car work cannot be denied.

This recent series of Rudge-Whitworth wire wheel victories is but the climax of a truly remarkable year in Wire Wheel history. All the big races abroad have been nearly clean sweeps for Rudge-Whitworth, with all the winning cars so equipped. In this country wire wheels have made a wonderful showing in the big American races—so much so that nearly all the noted drivers are planning to use wire wheels next year. Abroad, of course, about 85 per cent. of the medium and best grade cars are wire wheel equipped, and wooden wheels have practically disappeared. At the foreign shows wooden wheels were so scarce as to be almost a curiosity.

And the only reason that many more manufacturers did not show Rudge-Whitworth wire wheels at New York and Chicago was the fact that they could not get them in time.

Which brings us to the real important point affecting you manufacturers and dealers.

If you will co-operate with us to the extent of placing contracts and delivery dates immediately, we can take care of your demands.

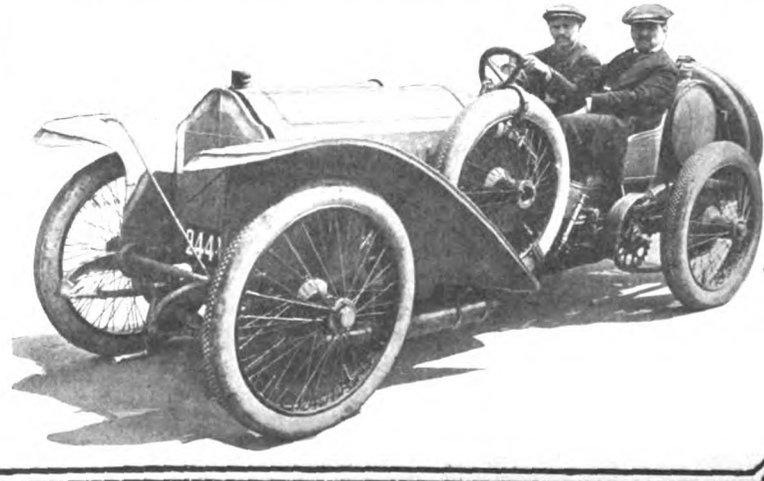
4 Hours 344 miles 1,344 yards = 86.19 m.p.h.
5 Hours 422 miles 1,574 yards = 84.59 m.p.h.
6 Hours 518 miles 312 yards = 86.36 m.p.h.

Table of World's Records Established by Hemery Driving a Lorraine Dietrich

(CAR AND DRIVER SHOWN BELOW)



Hemery started out for the six hours' race world's record with the idea of smashing as many intermediate records as possible.

The table shows his success.

That Rudge-Whitworth wire wheels played an important part in the establishing of these records is more clearly shown when it is considered that the previous records were held by a car not mounted on wire wheels. In the six hours, Hemery was able to increase the record from 451 to 518 miles and he was able to reduce the time for the first 500 miles from 6 hours 40 minutes to 5 hours 48 minutes, almost an hour faster than the previous record. The average speed for the 500 miles was 86 miles per hour as against 74 with the car not equipped with wire wheels.

The average speed for the six hours was 86 miles an hour as against 75 for the car not equipped with wire wheels. It is also interesting to note that in the first 50 miles of the last hour, Hemery maintained a speed of 101.61 miles per hour. Still more remarkable is Hemery's record when it is considered that during the third hour he was forced to stop 23½ minutes to replace a couple of cracked shackle bolts.

Our handsome book on wire wheels mailed upon application.

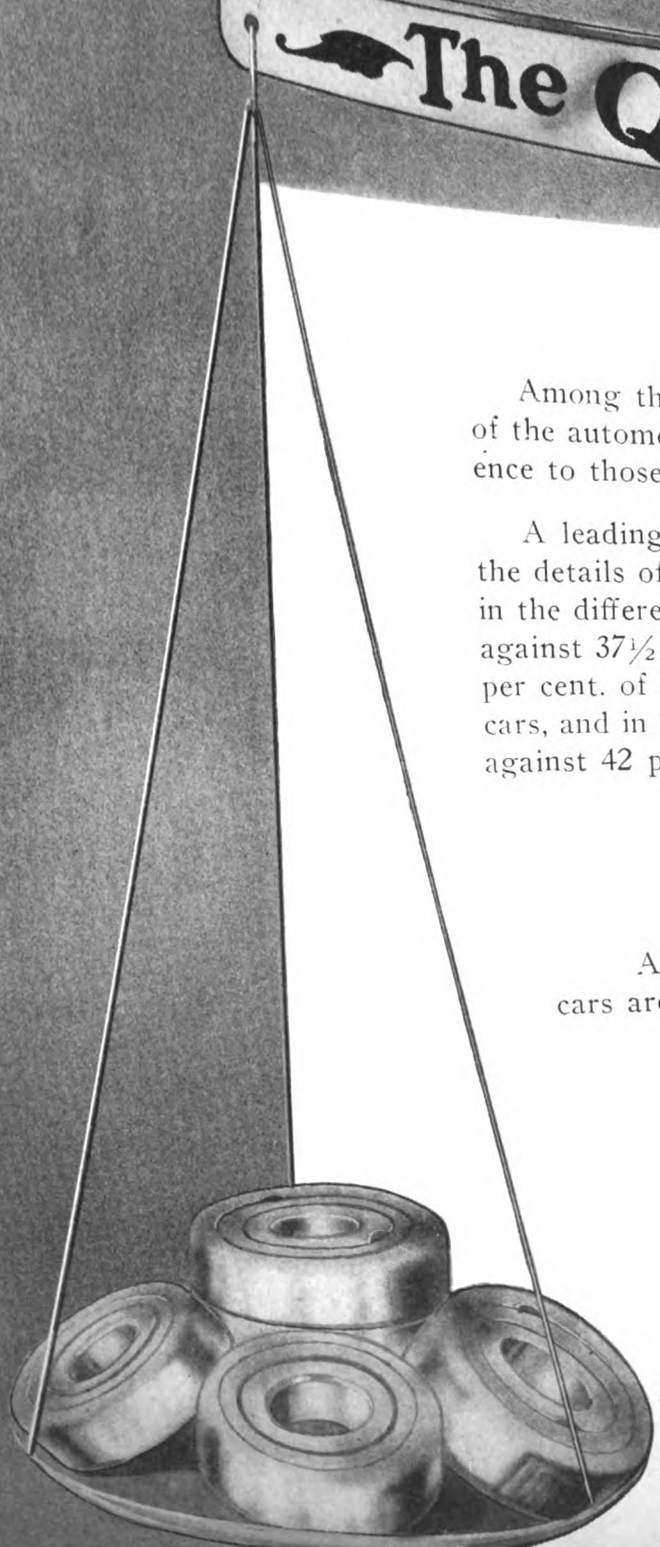
NEW DEPARTURE

The Quality Bear

Chicago Automobile Show, Both Weeks,



Among the most conspicuous developments in the perfecting of the automobile is the increasing use of ball bearings in preference to those of other types.

A leading publication in the trade has carefully summarized the details of 1913 models and shows that ball bearings are used in the differential of 53 per cent. of the pleasure cars for 1913, as against 37½ per cent of the 1912 cars; in the transmission of 75 per cent. of the 1913 models, as against 64 per cent. of the 1912 cars, and in the rear wheels of 52 per cent. of the 1913 models, as against 42 per cent. of the 1912 cars.

American Made for

A further important fact is that the 1913 European cars are universally equipped with ball bearings.

The American Made New Departure ball bearing is in more than 80% of the American pleasure cars made for 1913 selling. This bearing is guaranteed for strength of material, uniformity of dimension, accuracy of manufacture and fineness of finish.

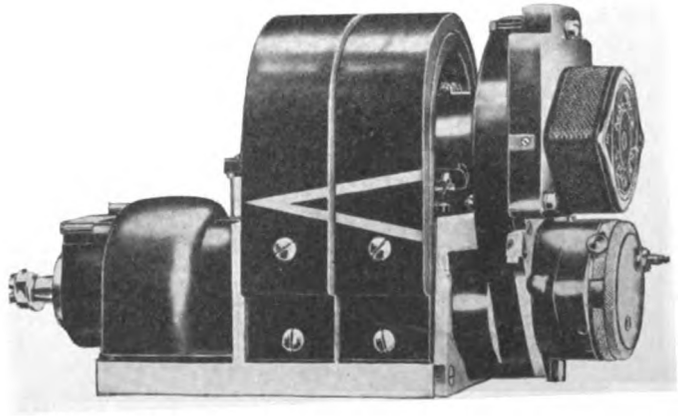
OBSERVE carefully, at the Chicago show, the preponderance of Eisemann magnetos with ***Automatic Spark Control*** on the trucks of class and size. The more severe the demands upon the truck the more likely that it is equipped with Eisemann magneto with ***Automatic Spark Control.***

The fact that Eisemann systems are found on so large a percentage of commercial vehicles speaks volumes for the efficiency and reliability of these products. In this field real merit counts most, for the success of the truck depends upon its economical operation and up-keep and in these essentials proper ignition plays a most important part.



The remarkable gain in volume of business and in number of concerns using Eisemann equipment recorded in the last year or so is another evidence of the growing realization

Digitized by Google

of the real value of Eisemann ignition devices. In this short space of time the increase has been something over two hundred per cent with no let-up in sight. In spite of this fact we have been able to live up to our promises fully as regards deliveries and shipments.

There's no reason why you can't have the most efficient ignition system on your product and have no delays in the delivery thereof. Better get in touch with us today.

Triplex

Finishes the Work the Carburetor Leaves Half Done

ECONOMIZES FUEL INCREASES MILEAGE PROMOTES FLEXIBILITY
PREVENTS BACK FIRING THE READIEST SELLER ON THE MARKET

A DIRTY MOTOR IS A SHORT LIVED MOTOR

Nothing tends to lower the efficiency, flexibility and sweet running qualities of a motor quicker than an improper mixture. Faulty carburetion is the prime cause of carbonization Carbon-clogged cylinders, sooty spark plugs sap the ambition out of a motor, shorten its service.

Loss of COMPRESSION is caused from DIRT taken into cylinders through CARBURETOR. The TRIPLEX MAKES IT AN IMPOSSIBILITY for ROAD DIRT to get into the cylinders. DIRT OR DUST acts as a grinding material and causes loss of compression by grinding down PISTON, RINGS, AND PITTING OF VALVES.

THE TRIPLEX MAKES IMPERFECT CARBURETION A MECHANICAL IMPOSSIBILITY

The TRIPLEX is a device placed between the MANIFOLD AND CARBURETOR TO BREAK UP the mixture—the fuel.

The TRIPLEX will EQUALIZE the most UNEVEN mixture that leaves the carburetor—makes it uniform throughout.

Operating as it does on a tried and proven scientific principle, the TRIPLEX insures a mixture which will burn CLEAN to the last atom. It is a physical impossibility for a bit of live gas to remain unignited. BLACK SMOKE is emphatically done away with—CARBONIZATION forestalled.

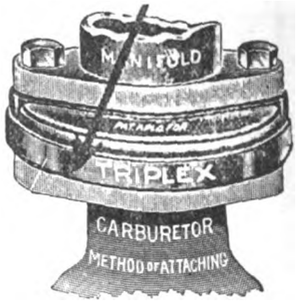
A TRIPLEX WILL PAY FOR ITSELF IN TWO MONTHS. By utilizing every drop of gasoline to its full capacity, the TRIPLEX makes a saving of over 25 per cent, per gallon. It gives you 5 gallons of FUEL at a cost of FOUR. It makes high-proof gasoline out of low.

Furthermore, it increases power proportionately. The full cylinder charge is ignited every time—the maximum power delivered at the point of highest efficiency. Because there is no fuel waste, there is no power waste. A TRIPLEX is a double economy—it INCREASES power at the same time it DECREASES fuel consumption.

INSURE YOURSELF AGAINST BACK-FIRING WITH A TRIPLEX. Another advantage it possesses is that it prevents FIRING a car due to the fact that any FLAME is cut off in trying to go through the TRIPLEX. The principle is the same as the non-explosive feature of a miner's gauze lamp.

Further advantages are that a TRIPLEX makes starting easier regardless of temperature or atmospheric conditions, and stops suction of live gasoline when the motor is cold.

The TRIPLEX can be readily attached by anyone in one-half hour's time.



THE TRIPLEX IS GUARANTEED. The TRIPLEX is guaranteed to do all we claim for it, or your money back. Therein lies YOUR protection. For further information write us.

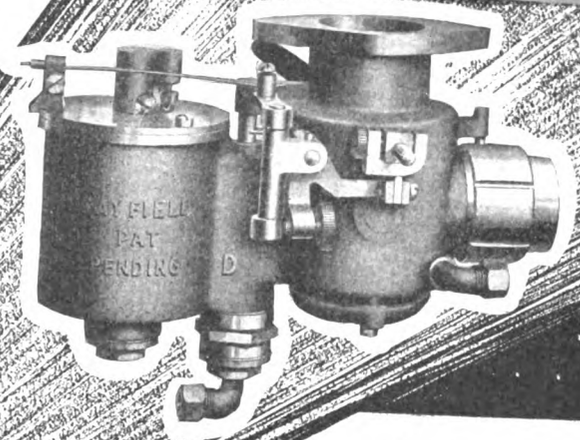
RAYFIELD CARBURETORS



The Sensation of the Year

RAYFIELD Carburetors created wonderful interest at the New York Show. Motorists from all over the world were eager to learn why the RAYFIELD had won its reputation for being

"The World's Greatest Carburetor."

Those who have not investigated the superlative merits of this carburetor should not fail to do so—

At the Chicago Show, Coliseum Annex, Spaces 114-116

Competent men will be on hand to show you why the RAYFIELD, through its perfection in design and construction, holds more WORLD'S RECORDS in every kind of contest than all other carburetors. They will also show you why the RAYFIELD makes good in every-day service, WINTER OR SUMMER, HIGH OR LOW ALTITUDE, RAIN OR SHINE, with the greatest EFFICIENCY and ECONOMY.

Your visit to the Chicago Show will not be complete without seeing the RAYFIELD Exhibit

Out of 30,000 Gears 29,982 Found O. K.

By Particular Manufacturer

A short time ago we completed a contract with one of the largest automobile manufacturers (name on request), whose product has a most excellent reputation for quality.

This contract consisted of 30,000 Transmission Gears, made from our special brand of 3½ per cent. Nickel Steel.

Although the inspection department of this manufacturer is the most exacting and careful of which we have knowledge, only 18 of this vast quantity of gears were not accepted.

GRANT-LEES GEARS

can be depended on for durability, accuracy in measurements and perfection in finish.

We **specialize** on automobile gears. We believe our heat-treating department the most efficient in the business. It is in charge of a man who has specialized in gears for twelve years.

Grant-Lees Gears are exceedingly hard, long-lived and durable—and wonderfully tough. They can be depended upon to stand up through every emergency.

Grant-Lees Gears have a fine, smooth finish that is the envy of our competitors. No one else takes such exacting pains in this work. To **keep** the finish perfect and protect our gears from any possibility of harm, each gear is packed in an individual box—as carefully as ball bearings are packed.

We Can Make You Better Gears and Save You Money

Why keep a big investment tied up in gear-making machinery, stock and labor hire, when you can contract for all the Grant-Lees Gears you want—get them just when you want them—get assured satisfaction—and get them at a lower cost than you can manufacture them in your own shops?

Let Us Get Down to Facts and Figures With You

THE GRANT-LEES MACHINE CO., 2360 Sixty-ninth St., Cleveland, Ohio

HESS AXLES

THE prestige and reputation attained by the Hess Spring and Axle Company as manufacturers of high grade motor car axles is as unique as the motor car industry itself.

Although the first axles were produced more than four years ago, two years were devoted to testing and experimenting before the first axles were placed on the market. Since then fourteen manufacturers have exclusively adopted Hess axles.

A further gratifying fact of the success of Hess axles is the increasing demand from new manufacturers and renewals of contracts from present users.

Hess axle equipment on your cars means assurance of successful service and the elimination of axle trouble.

THE HESS SPRING AND AXLE COMPANY

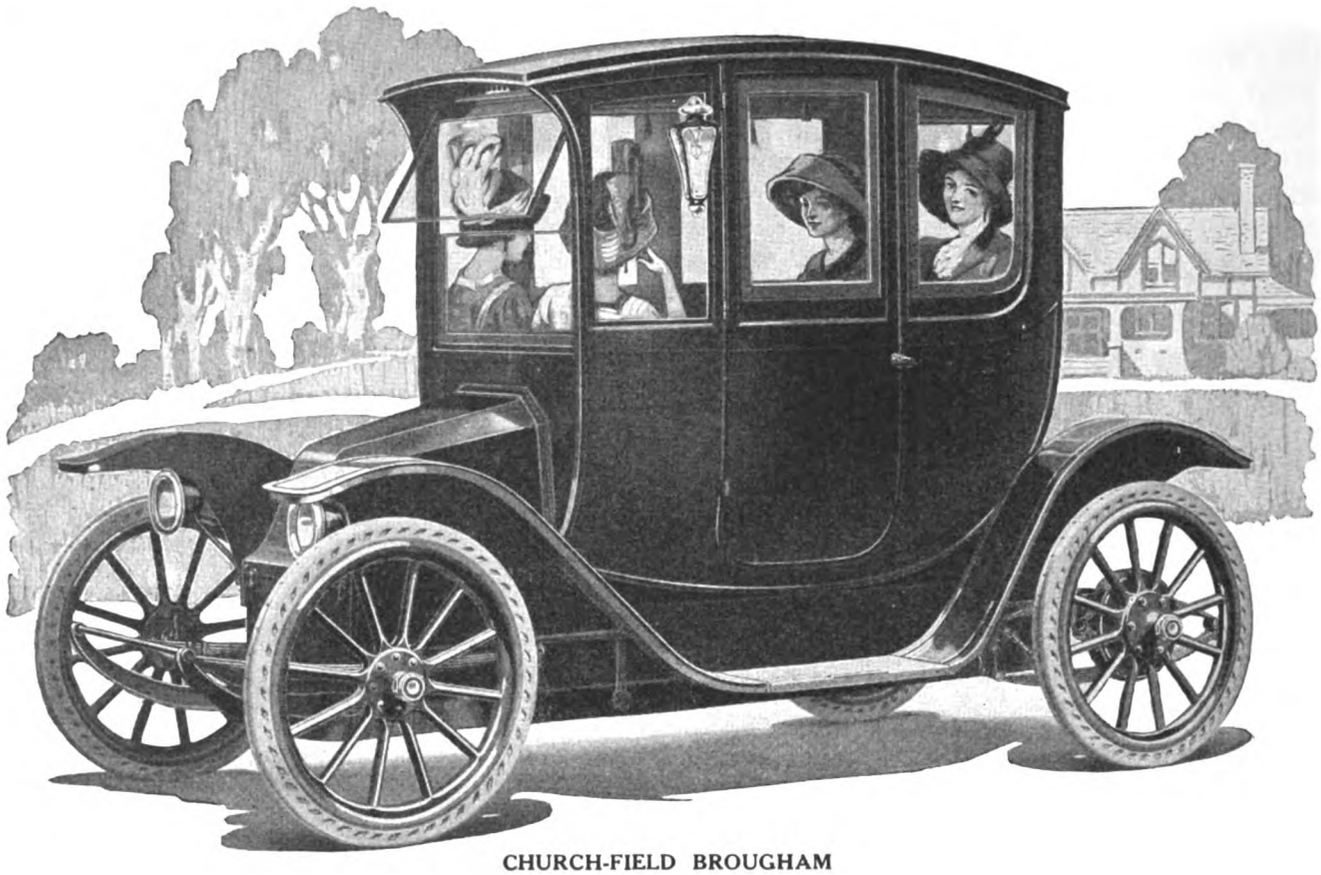
SPRINGFIELD CONVERTIBLE BODIES

With a Springfield Convertible Body, a few minutes work will turn the open touring car into a handsome luxurious closed car.

This radical departure from the unsightly, uncomfortable, ordinary top, is the final result of three years' development and it is today the *only* practical all-year-round body on the market.

When open, there are no signs calling attention to the fact that the body can be entirely enclosed in glass—just an ordinary closed top is visible as shown in this illustration.



When in position, the Springfield Convertible Body gives a beautiful glass enclosed, weather proof car with wide doors free from obstructions—in every way equal to the permanently closed car in appearance and comfort.

Our Modest Output

By R. E. Olds, Designer

After 26 years, and perhaps a record success, I am building but 50 cars daily.

Men ask, Why this modest output?

Why aren't you today in the 40,000 class, with all this fame, all this experience, and with such a car as Reo the Fifth?

Not for Lack of Orders

It isn't due to any lack of demand. There were times last year when orders from users ran five times our factory output.

For months at a time we were thousands of cars behind on immediate shipments.

And the same condition will repeat itself. We know that now. In April and May there will be five buyers for every car, no doubt.

But here's the other side:

The Other Side

Our present output, with this model factory, brings the cost of production down to the minimum.

If I build two or three models the cost would increase by some 20 per cent, I figure.

A larger output would make impossible such supervision as this car gets. I can't find the men to give it.

And hurrying men, or working nights, would lead to oversights.

Here's What We Do

Each lot of steel is analyzed twice, before and after treating.

Gears are tested in a crushing machine, to prove that each tooth will stand 75,000 pounds.

We use special springs, made from the center one-third of the finest steel ingots. And those springs are tested for 100,000 vibrations.

We use a $75 magneto to stand the tests which we require of that.

Everything is discarded—materials or parts—which shows the least shortcoming.

Parts are ground over and over to get utter exactness. Tests and inspections are carried here to the very last extreme.

Each engine, for instance, is tested 48 hours—20 hours on blocks, 28 hours in the chassis. There are five long tests, covering every requirement.

Where Savings Go

We have, as I say, ideal factory efficiency. Engineers from everywhere come here to inspect it.

I have spent years and years in perfecting it, and I cannot apply it to a larger production.

We build only one model. We build all our own parts. We make no material changes, for our car is right. So our tools and machinery last year after year.

We save in these ways some $200 per car. It is that saving which pays for all this care and inspection. And it pays for things like these:

Costly Extremes

We give to each part a big margin of safety. In fact, each part is built to stand the tests for a 45 h. p. car.

We use 15 roller bearings—11 of them Timkens—where the usual ball bearings would cost one-fifth as much.

We use in each car 190 drop forgings, at twice the average cost of steel castings. We do this to make flaws impossible.

We equip the car with over-size tires—34x4. The cost is about $60 per car over tires which some call sufficient on a car of this weight. But the cost comes back to you over and over in the lower tire upkeep.

We use a centrifugal pump.

We use 14-inch brake drums.

We use 2-inch, 7-leaf springs.

Then note the costly finish. Each body gets 17 coats.

The deep upholstering is of genuing leather, filled with the best curled hair.

Every detail shows the final touch. The electric side lights are set in the dash. And even the engine is nickel-trimmed.

All for $1,095

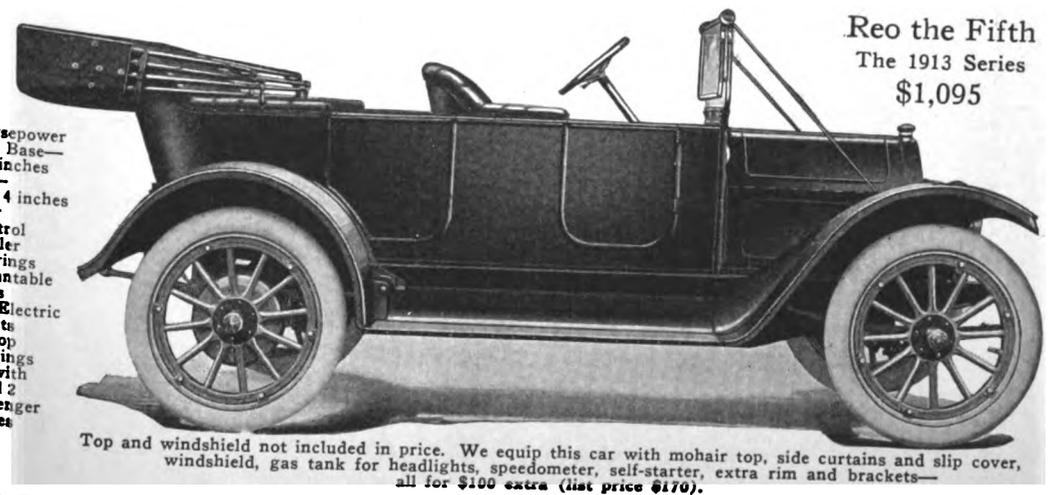
To build a car like this, inside and outside, for $1,095, is an amazing achievement.

It would be to me an impossibility on a much larger production. And a lesser car would not be wanted when men found it out.

That's why I limit my output.

It is also the reason why men want more cars than I can build.

The $100 Control



I believe men would pay $100 extra for the center control in this Reo the Fifth. Yet it adds not one cent to the cost.

All the gear shifting is done by one light handle, entirely out of the way. It is done by moving this handle only three inches in each of four directions. It is as simple as moving the spark lever.

No reaching—no levers in the way. Both brakes are operated by foot pedals. Both the front doors are clear.

This arrangement permits of right-hand control, combined with left-side drive. And that is regarded as an essential in a car that's up to date.

A thousand dealers handle Reo the Fifth. Write for our 1913 catalog, and the nearest dealer's address. Then see him, please, before the April rush.

Top and windshield not included in price. We equip this car with mohair top, side curtains and slip cover, windshield, gas tank for headlights, speedometer, self-starter, extra rim and brackets—all for $100 extra (list price $170).

R. M. Owen & Co., General Sales Agents for Reo Motor Car Co., Lansing, Mich.

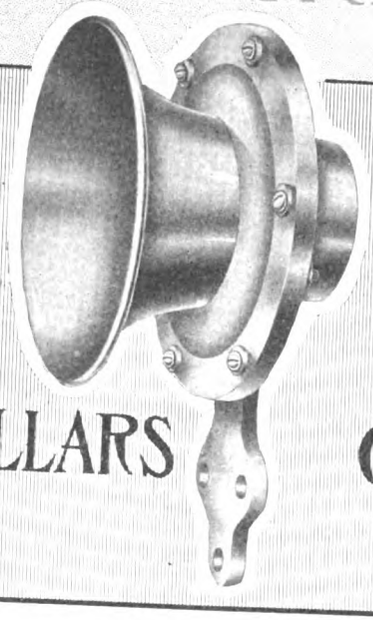
QUBIT

ELECTRIC HORN

THE ULTIMATE SUCCESSOR

TO THE BULB HORN

Dealers!



This out-of-ordinary electrical signal will find ready sale where ever introduced

Louder, more durable and better looking than the bulb horn.

Sells on sight. See next page

Digitized by Google

285.000 ELECTRIC CUBIT HORNS ALREADY CONTRACTED FOR

RETAIL FOR THREE DOLLARS

BIG DEALERS OPPORTUNITY

For dealers who have not responded to our previous advertising

Here is a real signal at a low price.

Has a high-toned musical blast---uses but little current---has no **vibrator** (the diaphragm is the armature)---cannot wear out, but gets better with age---needs no oil---runs on **six volts**---cannot get out of order.

Black enamel with very high gloss.

Weighs two pounds and a half.

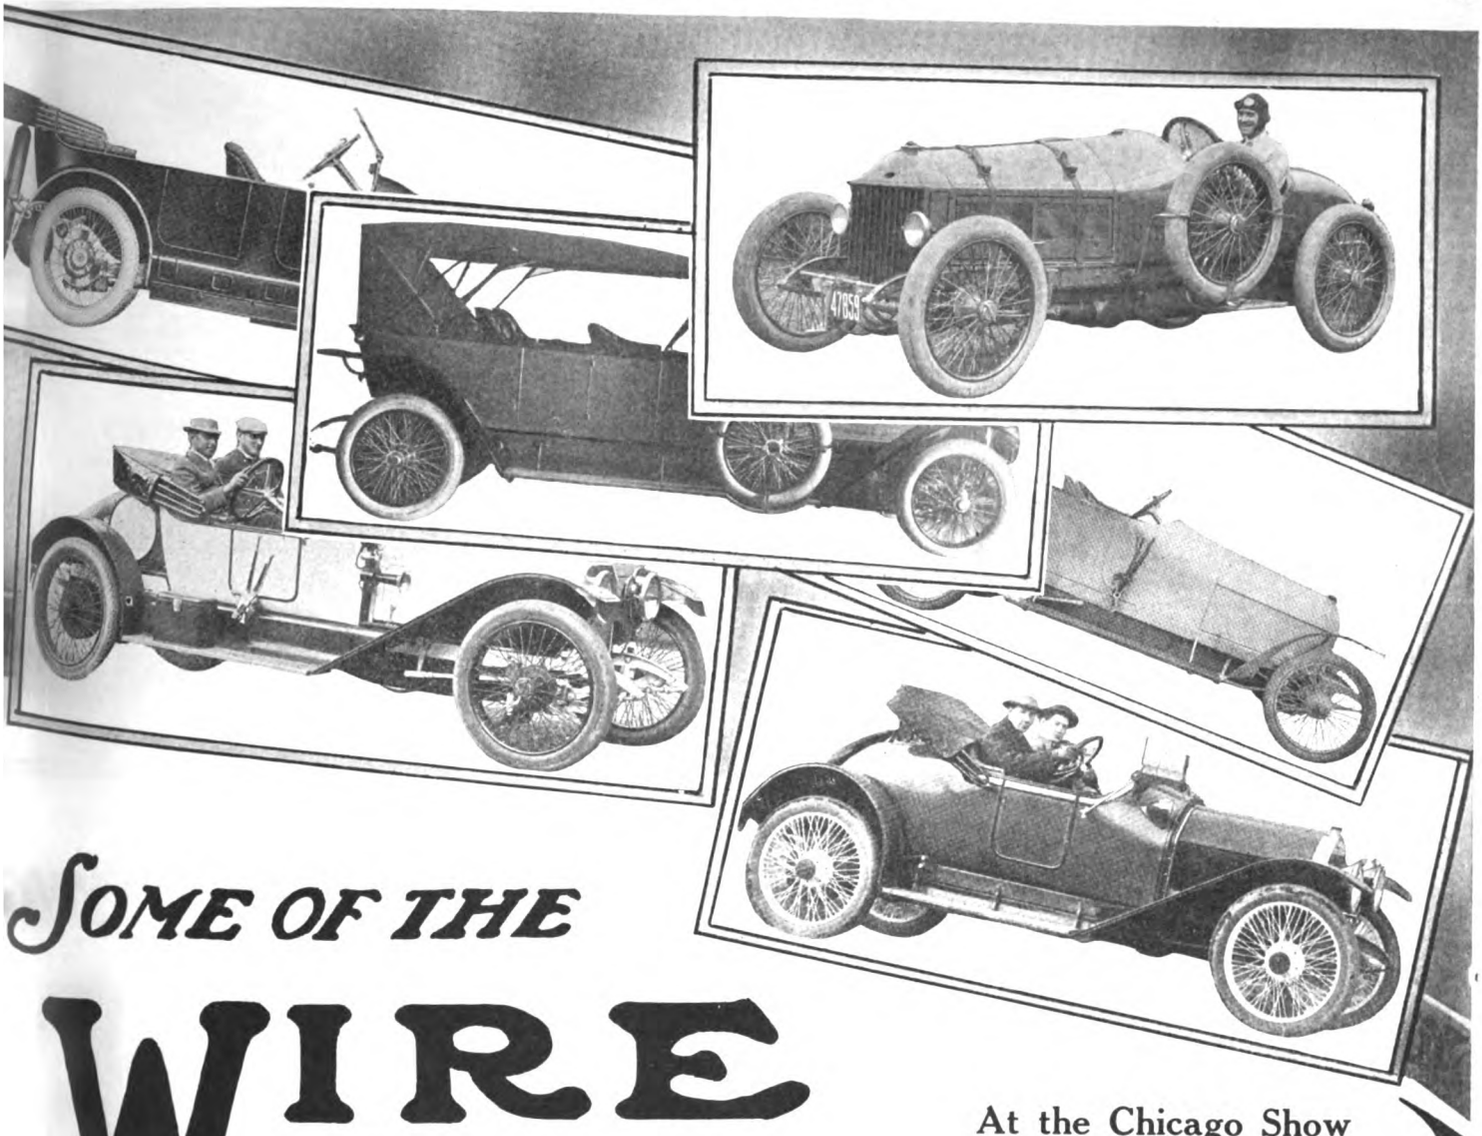
SHOWING

McCUE EQUIPPED

The above cars were centers of attraction at the New York Show —the public is becoming "wire wheel wise."

Here is the evidence—you can't discount it. **Wire wheels have come to stay.** Most notably, the McCue product is fast becoming a dominant factor in the field.

Your prospective buyers want wire wheels—particularly McCue wheels—there isn't an argument they or you can raise discounting their practical worth. There **are** enough arguments **against** wooden wheels.



McCue Wire Wheels, aside from their tremendous resistance to radial and thrust shock, offer one great factor of safety—"**pocket book safety.**"

These wheels save tires—as high as fifty per cent.

Because they are light at the periphery and heavy at the hub—and so the road pound on tires at point of contact is negligible. Wooden wheels deliver a heavy blow on every inch of the tire at each revolution.

THE McCUE COMPANY

Digitized by Google

SOME OF THE WIRE WHEEL AUTOMOBILES

At the Chicago Show these cars are again attracting the buying attention of the Middle West. Wire wheels are counted as big refinements.

Here's the illustration:

Take a hammer with a ten pound head—strike a piece of rubber continuously and see how soon it disintegrates. Then hold the hammer by the head and strike the rubber with the end of the handle—and you will wear your arm out—but not the rubber.

Remember, McCue wheels are detachable. We discard demountable rims as impractical. They add weight at the pounding point.

You specify wire wheels on the cars you sell and you will find yourself a leader in competition—that is, if competition don't catch the drift of this argument **first.**

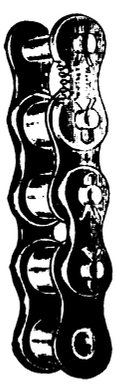
WHITNEY



The Most Practical Chain for Motor Trucks

Because the "Whitney" Cotter Detachable Chain can be easily separated at any link and lengthened, shortened, or repaired without the use of any special tool. This is of great advantage to truck builders, owners and drivers.

"Whitney" Chains are used by the leaders because they are strong, accurate, dependable and above all long lived. They are made right and they're made from the right kind of material, thus giving highest efficiency. When making replacements insist on a "Whitney."

"Whitney" Chains Are Built for Strains

THE WHITNEY MFG. CO., Hartford, Conn.

Continental

The motor that gives a car a good name

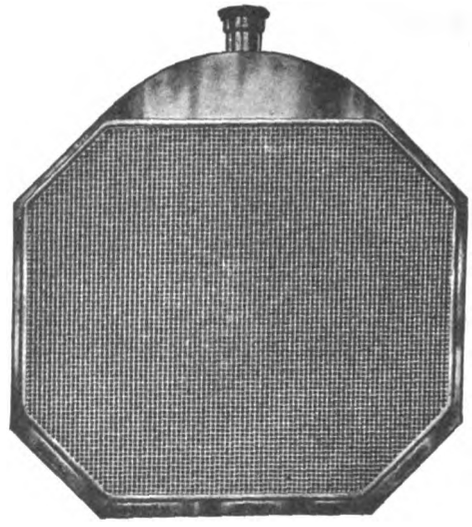
The six-cylinder Continental unit power plant. Bore, 4⅛ inches; stroke, 5¼ inches. Built to accommodate any type of self-starter now made. Suitable for right or left drive.

Four-cylinders—20 to 70 H. P.

The Continental is responsible for more good motor car reputations than any other single product.

A common expression is this: "It must be a good car: The motor is a Continental."

The good name of the motor lends itself to the car. It is a guarantee of quality.



On the other hand, the manufacturer using the Continental does so because he realizes, more keenly perhaps, than his trade, the worth of this motor.

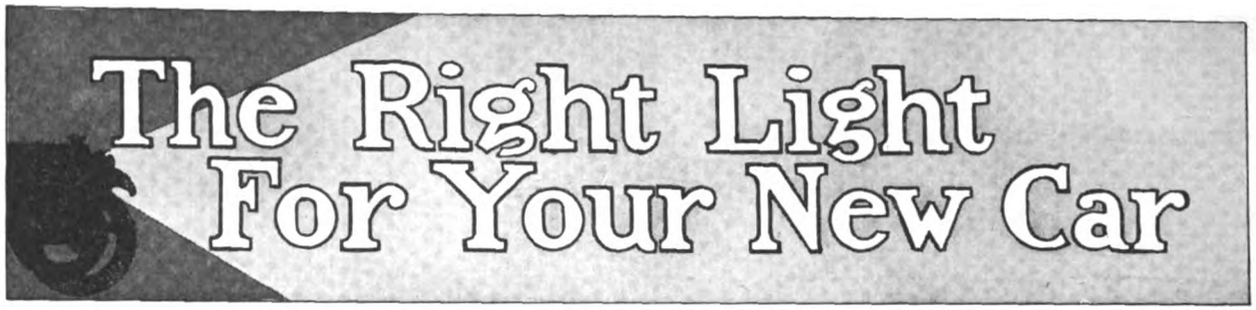
He uses it because he has a product worthy of it and he has enough pride in both to maintain the Continental standard throughout his own product.

Chicago Show Exhibit — February 1 - 15
Space 56, Coliseum Gallery

Continental Motor Mfg. Co.
DETROIT, MICHIGAN

Factory Representative.
K. F. PETERSON, 122 S. Michigan Blvd., Chicago.

Our departments of engineering and design co-operate with the men who build the car—combining their weight of experience in radiator making with the particular requirements of the designer of the automobile.



We will not, however, endanger the reputation we have made by making radical changes from established design. In standing by this resolve, we have, on rare occasions been obliged to lose business—something to be regretted, but none the less necessary.

Mayo Radiators are built to hold the engine at an even temperature—not too hot to endanger its usefulness, nor too cool to lose its efficiency. "Tolerance" in change of design is therefore liberal—but it has its limits.

If you, as the man who has sold the car, find yourself in "hot water" so to speak, with a leaky, inefficient radiator and a "superheated" customer, then be sure this car was not equipped with a Mayo Radiator. Dealers who sell cars Mayo equipped know that the radiators will stand up under any unfavorable condition short of a blow with a hammer or a bad collision.

Mayo Radiator Co.
NEW HAVEN, CONNECTICUT

Digitized by Google

Why does gas lighting with an automatic lighter give you just as much convenience and more efficiency, reliability, and economy than any other lighting system? Here are the facts. Keep them in mind in deciding upon any system of automobile lighting.

Convenience

First of all, you say you want convenience in your lighting system.

Prest-O-Lite, when used in connection with an automatic gas lighter, offers you perfect convenience.

You can use gas in all your lamps, and you can light or extinguish all or any of the lights from the driver's seat, whether your car be moving or standing still. The flow of gas is automatically regulated to produce exactly the proper height of flame at all times. There are several good automatic gas lighters on the market. We make one—the Prest-O-Liter. It is about as simple as an electric doorbell. Any of our Service Stations will gladly demonstrate it to you. See it and judge for yourself whether any other system is any more convenient.

Then remember this **distinct advantage,** that should it ever be temporarily disabled, you are not left in the dark. You can light your **gas** lamps with matches, and YOU STILL HAVE LIGHT.

Reliability

Any lighting system on a motor car is subject to the heaviest jolts and shocks. Because of this, and because one must either carry or make his own light, automobile and house lighting are entirely different propositions.

Prest-O-Lite's absolute reliability is unquestioned. There are no delicate adjustments, connections, or complicated attachments to get out of order. Prest-O-Lite is so absolutely simple, it is trouble-proof. If, through carelessness, you allow your Prest-O-Lite to run dry, a Prest-O-Lite agency is close by, wherever you may be. Every city and town, and nearly every cross-road village, has its Prest-O-Lite exchange agency.

Here, then, is a system that every dealer understands; that never need leave you stranded on a country road; that never keeps you waiting for a factory expert to come and restore its usefulness; that is not affected by the heaviest downpour of rain.

In short, you have in Prest-O-Lite a system you can absolutely depend upon all of the time.

Efficiency

Exhaustive experiments have proven that the naked light of a ¾-foot acetylene burner gives 30 candle power without a reflector. The average **naked** light in other systems is 20 candle power or less. Weaker lights than Prest-O-Lite can give a blinding effect by the use of parabolic reflectors.

This principle was first employed in gas lamps, but was discarded as unsatisfactory because, while this type of reflector threw brilliant, concentrated rays far ahead it did not give the light **down on the ground** 10 to 50 feet ahead of the car, where you need it most, to give a perfect view of the road itself. Every experienced driver will tell you that Prest-O-Lite, with the reflectors now used in the gas lamps, gives all the light needed far ahead, and **in addition** gives a light immediately in front of the car which affords the driver a better idea of the ruts and bumps than he can get **even in broad sunlight.** This effect cannot be had from any lamps using parabolic reflectors.

Prest-O-Lite, as a practical road light for the driver, has no equal.

Economy

There is no other efficient lighting system that costs less to operate and maintain than Prest-O-Lite. The average cost of Prest-O-Lite operation, among over five hundred thousand actual users, is less than $10 per year. The user has no expense for repairs, for renewal of worn-out parts, or for adjustments, and its operation consumes no power and in no way interferes with the full efficiency of your engine.

Just one repair bill on any complicated, delicate lighting system might easily cost more than years of Prest-O-Lite service.

But even if Prest-O-Lite operation costs more than other lighting systems—instead of less—its reliability, its efficiency, its freedom from annoying troubles, should make it twice as valuable to any experienced driver.

No matter what self-starter is on your car, your lights should be gas lights. A self-starter is, after all, a highly desirable convenience, but not an actual necessity. Reliable lighting on your car is almost as essential as fuel. The disabling of a self-starter might mean, at the worst, your having to use the starting crank, but an accident to your lighting system may leave you helpless in the dark. But so long as you have Prest-O-Lite and matches you have light.

Almost any manufacturer will equip your new car with Prest-O-Lite and an automatic gas lighter, if you insist. If your car is now equipped with Prest-O-Lite, any of our Service Stations or any dealer can install an automatic lighter at small expense.

Before you decide on any gas lighting system, post yourself thoroughly by sending for a free booklet, "Light on the Lighting Problem," reprinted by permission, which gives all the facts of lighting prepared by one of the foremost authorities. By sending coupon below, it will reach you without charge by return mail.

THE PREST-O-LITE COMPANY
287 E. South Street, Indianapolis, Ind.

Please send free booklet, "Light on the Lighting Problem," to

Insist on Gas Lighting

Digitized by Google

You Can Cash In On This Campaign

More than 10,000,000 readers will see Prest-O-Lite advertisements along the lines of the one on the opposite page. Among these readers are **your** patrons and **prospects.**

You'll want to read these advertisements carefully. Be prepared to reap what we are sowing.

How To Do It

You are familiar with the Prest-O-Lite Gas Tank Proposition—what it means to you as a dealer, and what it means to the hundreds of thousands users of Prest-O-Lite.

You should be equally familiar with the Prest-O-Liter. It is the final touch that adds unexcelled convenience to an efficiency and reliability that has never been questioned.

Consider the field open to you, the number of cars equipped with gas, to say nothing of the new cars every day. All these are your prospects.

The Prest-O-Liter

is a simple, efficient, automatic lighter for gas lamps that you ought to know about. It consists of the car's ignition battery or a few dry cells, a coil, wires to the lamps, an automatic reducing valve and a control valve and a push button on the dash. Turn the valve, push the button and the lamps are lit.

The Prest-O-Liter is easily and quickly installed and gives the user every convenience of the most complicated and expensive system, with greater reliability and economy in upkeep.

Send for Details

Every dealer should know about the Prest-O-Lite Campaign for **reliable automatic lighting.**

You'll want to be able to demonstrate and install the Prest-O-Liter, when the calls come.

We're ready to help you in every way and furnish literature for you to distribute. Use the coupon below, get in touch with the movement and be prepared to get your share when this business comes your way.

Penn Springs

Penn Spring Works

BALDWINSVILLE
NEW YORK

PENN SPRINGS are tested for resiliency and tensile strength far beyond any point that could be reached in every day service. They are guaranteed against fatigue and through the special grades of steel and methods of construction they will give service "plus."

Car manufacturers can make our engineering force part of their organization in the work of producing springs that are true in even load carrying, resilient and engineered to fit the particular car for which they are designed.

Add $10 to $25 Profit to Each Automobile Sale

Here's an easy way to pick up an extra Ten or Twenty Dollar Bill whenever you sell an automobile.
Just send us the name of the purchaser and we will endeavor to sell him an Edwards Private Portable Steel Garage.
That's all we want you to do—merely furnish us the name.

You Invest No Money or Time

It means $9.25 to $20 profit **FOR YOU** on each sale. And you've no money or time invested. Send us a list of all automobile owners in your locality, and on this plan you'll make a nice, clean profit—perhaps several hundred dollars.
The Edwards is far and away the most popular and widely advertised Private Garage. Our prices are much lower than others. And we've an excellent system of following up all names received. We won't miss any opportunities to close sales.

Write Us Now Send us your list of local auto owners at once, or we will be glad to answer any questions

Edwards Fire-Proof Garage

An artistic, fire-proof steel structure for private use. Gives absolute protection from sneak thieves, joy riders, fire, lightning, accidents, carelessness, etc. Saves time, work, worry and trouble. Comes ready to set up. All parts cut and fitted. Simple, complete directions furnished. Absolutely rust-proof. Joints and seams permanently tight. Practically indestructible. Locks securely. Ample room for largest car and all equipment. Made by one of the largest makers of portable fire-proof buildings. Prompt, safe delivery and satisfaction guaranteed.

The SPARTON

Dimensions:
Length, 12 inches
Flare, 7½ inches
6 Volts
Runson Dry Cells or Storage
Black enamel and brass or nickel bell

The First Electric Horn of Quality and Efficiency—At a Quantity Price

Big in Size—Big in Tone—Big in Value

To establish Sparton Value in your mind, compare it in tone, compare it in mechanical quality and efficiency; compare it from the standpoint of current consumption, appearance, size and finish, with the highest priced motor-driven horns. Then **compare prices.** The "Sparton" equals the best in quality, excels them all in durability and **its price is just about one-third.**

Quantity production alone makes possible "Sparton" Quality at "Sparton" prices. We have a capacity for producing 700 to 1,000 horns a day.

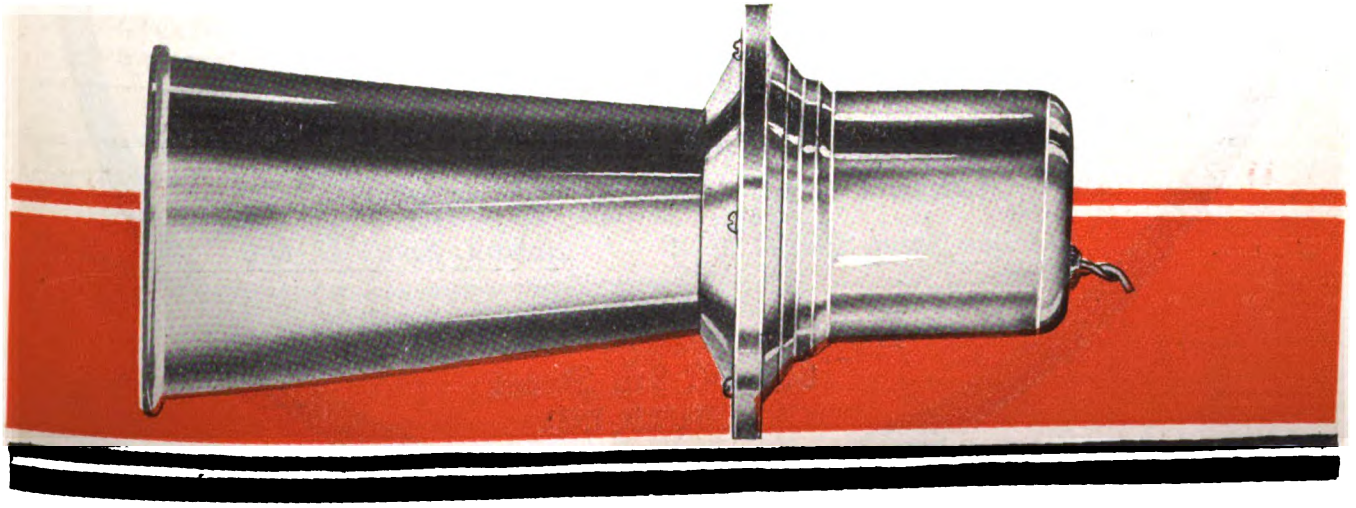
Two Styles Ready

Dash Type—In Black Enamel and Nickel or in Black Enamel and Brass.

Under-the-hood Type—In Black Enamel.

To Car Manufacturers

We are after "standard equipment" orders and can give immediate deliveries. We are setting a new pace for electric horn values. Write at once for sample horn and prices.



At Every Turn We Save You Profits That Every Other Manufacturer Must Pay.

We build our motors complete, manufacturing shafts and high speed bearings on high speed automatic machines; we stamp the laminations; wind both armatures and field coils; build a specially designed commutator; do all our own electrical work.

We stamp the bell diaphragm holders, front and rear, diaphragms, diaphragm actuators, motor covers, push button springs and castings.

For all these operations other horn makers pay a profit to someone else.

The Sparks-Withington Co., Jackson, Mich.

The Only Tire Reinforcement That Prevents Rim Cutting or That Will Hold Rim Cut Tires

Tire experts concede that inside fabric breaks and rim cuts ruin 90% of the automobile tires before the rubber tread is half worn out.

Interlocks reinforce the sides of the tires as well as the tread, because they completely enclose the tube, and the interlocking flaps lock to the rim under pressure, giving ample excess fabric strength both to the sides and the tread.

Interlocks prevent blow-outs, rim-cuts and fabric breaks—protect the tube against punctures and free you from the dread and annoyance of tire trouble.

There is nothing experimental about ***Interlocks.*** They have proved their efficiency by the hardest kind of long, fast road tests under the official inspection of tire experts of the leading tire manufacturers.

The ***Interlock*** Inner Tire is a high grade, full round ***Endless Inner Tire*** (not an inner shoe or reliner) and is made like a tire—of rubber and fabric. It is easily placed in any pneumatic tire—between the outer casing and the inner tube—to strengthen the casing and protect the tube against puncture.

Write For Our Booklet

that gives complete description of ***Interlocks*** and valuable tire information about the care of tires, that will save you a lot of unnecessary tire trouble and expense.

To Dealers: You will find ***Interlocks*** in all sizes, in stock at Beckley-Ralston Co., Chicago; Motor & Machinists Co., Kansas City; Bi-Motor Equipment Co., Boston; Fry & McGill Co., Denver; Western Auto Specialty Co., Iowa City, Iowa; and all leading jobbers of automobile supplies. Please give us the name of ***your*** supply jobber when you write. ***We want good dealers everywhere.***

TIMKEN
AXLES & BEARINGS

Read Your Answer in the Cars

DO Timken principles of axle and bearing construction work out in practise? Are their merits acknowledged by the leading motor-car builders?

These questions are natural and just. You have read the Timken stories of axle and bearing importance in previous advertisements.

You have felt, as you read, that Timken principles were right, that they must have proved right on many a steep hill and stony road.

Nor did you err, for hundreds of thousands of Timken-equipped motor-cars, pleasure and commercial, are daily demonstrating the worth of Timken principles and Timken construction.

At the points of severest service—there you are most likely to find Timken Equipment

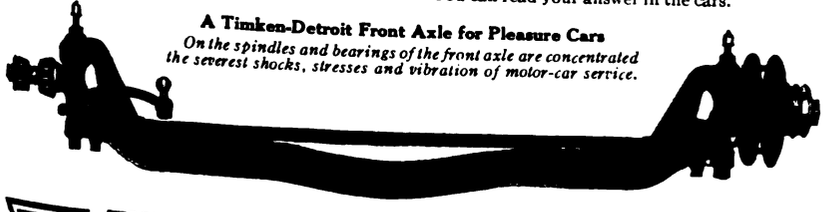
Because front axles and the bearings on their spindles *must* stand up to the tests of every day travel and meet the emergencies, builders of good cars dare not take chances at these vital points.

On the right are listed nearly all of the cars using Timken Tapered Roller Bearings and Timken-Detroit Axles. Among them, you will agree, are most of the best known and highest grade cars made in the country.

All of the makes of cars listed here use Timken Bearings or Axles on one or more models, throughout or in part.

To be specific, 97¼% of all these cars have Timken Bearings at the points of severest service—on the spindles of the front axle.

In addition to that, 93⅛% of the entire list have Timken Axles or Bearings at all or some of the following points: rear axle, rear wheel bearings, differential and pinion-shaft bearings, transmission bearings, commercial rear axle and jackshaft, and their hubs and bearings.



Also 61⅛% of the pleasure cars and 72⅛% of the commercial cars listed at the right have Timken-Detroit Axles, front or rear or both.

Coming back, then, to the questions, "Do Timken principles of axle and bearing construction work out in practise? Are their merits acknowledged by the leading car builders?"

You can read your answer in the cars.

A Timken-Detroit Front Axle for Pleasure Cars

On the spindles and bearings of the front axle are concentrated the severest shocks, stresses and vibration of motor-car service.

PENNSYLVANIA *Oilproof* VACUUM CUP TIRES

THE only tires on the market that embody the "Big Three" of tire service: Anti-Skid, Oilproof, Long Wearing—all guaranteed.

First—to introduce the suction principle of positive skid prevention. *First*—to guarantee definitely, in print, full wearing capacity (4000 miles, under liberal conditions of car weights). *First*—to tackle and defeat the "oil disease" bogey.

The addition of the new feature—resistance to oil—to the already famous qualities of skid prevention and longer service, has elected these tires to the highest place in the opinion of experts and exacting motorists.

The intense interest aroused by Oilproof Vacuum Cup Tires is becoming more and more materially apparent. Our factory at full blast is working overtime to catch up with our orders before Spring.

Dealers: Now is the time to file your order. Early deliveries are not for those who delay. Our national publicity is rapidly diverting the tire demand into the Vacuum Cup channel.

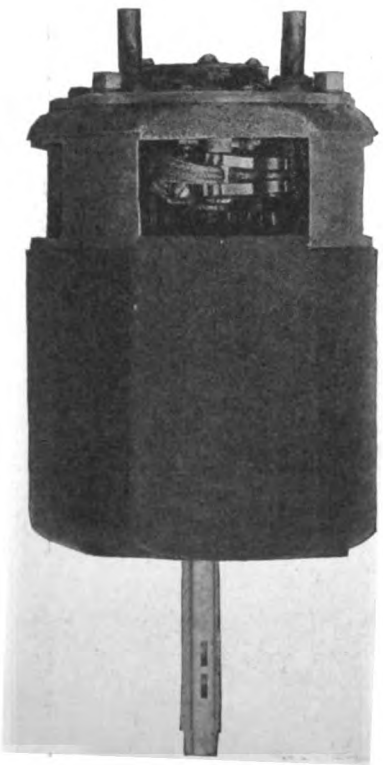
"AUTO-LITER"



The Positive Electric Starter and Lighter

There is no longer any question as to starting and lighting motor cars. We have overcome every difficulty and completely mastered the project. The Electric "Auto-Lite" is positive in its action at all times and under every known weather condition.

The simplicity of the "Auto-Lite" system is largely responsible for its success. There is nothing to get out of order. The two mechanically independent units are sturdy of construction and absolutely dependable in action.

Our starting motor turns the engine until an explosion occurs in the cylinders. It has proved as successful as the "Auto-Liter" outfit which has never failed in many seasons of service. It automatically disengages itself when the explosions do occur. Both are operated by a six-volt current, which eliminates excessive battery weight and other objectionable complications.

To manufacturers, dealers and prospective car owners our catalogue and descriptive literature are interesting and highly important. They treat the subjects of starting and lighting automobiles intelligently and exhaustively.

Our dealers' self-starter proposition is especially attractive. Write today.

Your Motor Car!

Electric Starter
Electric Lights
Center Control
Complete Equipment

Nyberg

Six $2,000
Four $1,650

YOUR MOTOR CAR is a stylish, comfortable car---one which any man may well be proud to own. A valuable addition to any dealer's line.

YOUR MOTOR CAR
Represents Real Value

It is not another sensation of the automobile world; it is not the car for which thousands have been waiting; it is not better than any car selling for twice as much.

Your Motor Car is just a beautiful, powerful car, designed by an engineer who has been identified with the automobile industry in America for fifteen years; built under his direction by an organization which has been trained to do things right at the lowest cost.

This engineer is Henry Nyberg, a graduate of the famous technical school at Malmo, Sweden; a practical mechanic who has worked out a plan by which you can buy Your Motor Car for at least 10 per cent. less than any other car of equal value.

This plan is based on conditions as they exist today. The automobile business has changed radically during the past few years. Certain features have been adopted as standard, so that it is no longer a difficult problem to determine the value of a motor car. Your Motor Car measures up to these standards in every way.

REAL MOTOR CAR VALUE
Is Determined by Many Factors

There are many good motor cars on the market now, but some of them offer you much greater real value, proportionate to the selling price, than others. A car may be right in every particular—design, material and workmanship; it may be manufactured in a modern factory; it may be sold at a reasonable profit —and still not be good value for the money.

The one big factor entering into the question of real value in a motor car—a point which many people overlook—is the conditions under which the car is built.

A car manufactured in a million dollar factory located on valuable land must have included in its selling price a share of this big investment. A car manufactured where living and labor are high must stand its share of that expense.

Your Motor Car is built in a town where labor conditions are unusually good; in a plain, substantial factory, designed for producing automobiles economically. The overhead expense on Your Motor Car is much less than that which most motor cars have to stand, and we are giving you the benefit.

YOUR MOTOR CAR
Itself Is the Proof

You have read many glowing statements regarding cars of all kinds, ranging in price form $500 to $5000. We could use a lot of superlatives in describing Your Motor Car, but it is not necessary. The car itself is the best proof we can offer of its unusual value.

Satisfy yourself on this point before you put up any money. Compare our car with others, selling at about the same price, bearing in mind that "Your Motor Car" is listed with complete equipment, including electric starter, electric lights, electric generator and storage battery, electric horn, top, windshield, speedometer, five demountable rims, nickel trimmings throughout, etc.

You should also bear in mind that the Nyberg SIX is a proven SIX, now in its third successful season. This is a point you should consider carefully when looking over the SIXES being offered for 1913. To be in line you want a SIX, but you cannot afford to take a chance on an experiment, and you will find that most of the medium priced SIXES are experiments.

You will NOT find "YOUR MOTOR CAR" at the Chicago Show. We have selected a better place to exhibit it---where you can sit in it---ride in it---or what not— "YOUR MOTOR CAR" is at our Chicago Branch, 2437-2439 MICHIGAN AVENUE

Nyberg Automobile Works

JONES
Speedometer

Based On A Principle

Centrifugal Force

Always Declares the Truth

THE truth is the wheel speed. The hand on the dial and the wheel on the road are one. They have a continuous line of metallic connection without gap or opening, branch or break. The hand of the meter is geared direct to the truth.

The wheel speed is recorded by centrifugal force---stable, fixed, unvarying for each speed. There is nothing to balance, nothing to counterpoise, nothing to compensate. Centrifugal force and speed are inseparably related.

The JONES SPEEDOMETER is not actuated or controlled, excited or impelled, induced or swayed by magnetic or temperature disturbances. Centrifugal force always tells the speed truth.

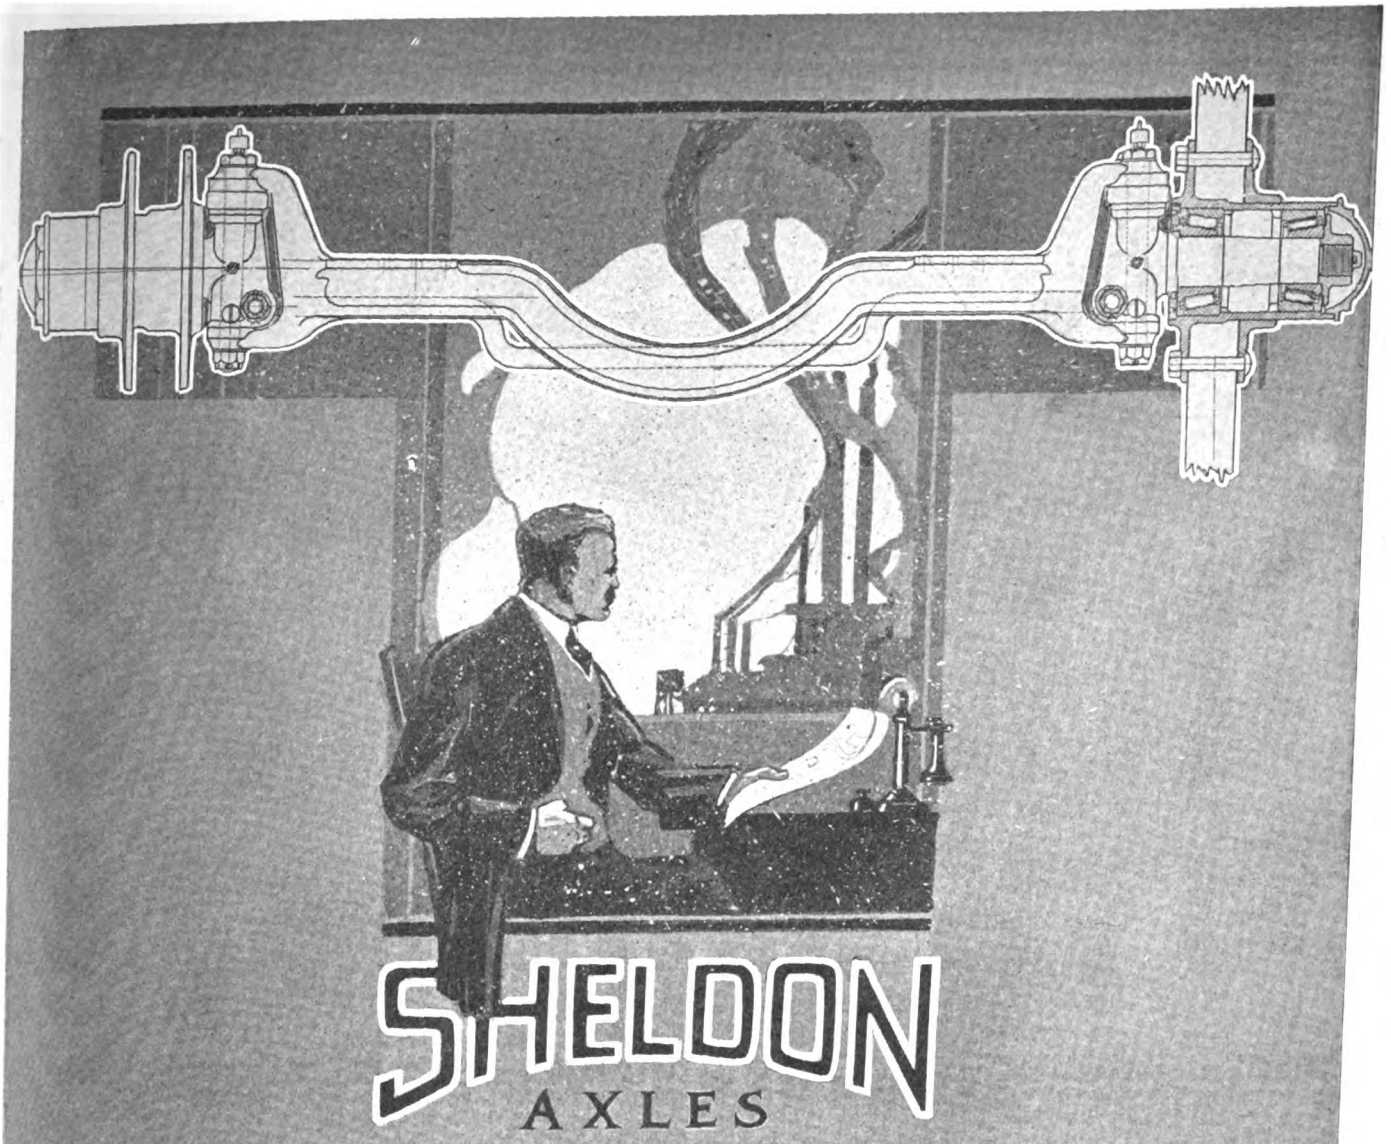
Stewart Speedometer

MAGNETIC PRINCIPLE

Model B
$50

The Stewart Speedometer is built on the *magnetic* principle.



Two hundred and one out of two hundred and seven automobile manufacturers equip their cars with the *magnetic* speedometer.

Which is absolute evidence that the magnetic principle is the only practical one and proof that the Stewart is giving absolute satisfaction to users of motor cars.

Permanent service stations in all principal cities

SHELDON AXLES

We couldn't improve on the construction of the Sheldon Axle so we are offering new features in design and equipment in order to maintain the position of Sheldon dominance.

Our new heavy service axle has the yoke arms bushed with Tobin bronze because it is at these two points that the greatest wear takes place.

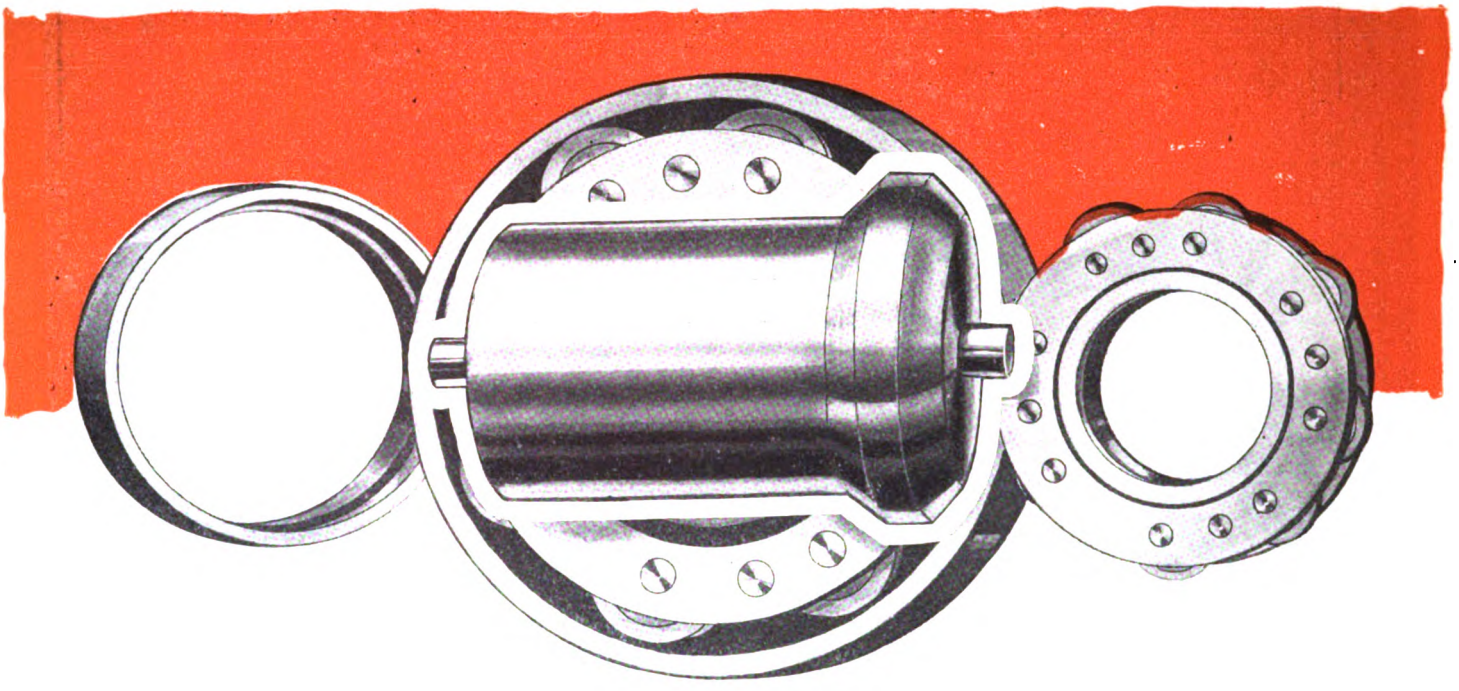
Friction is reduced to a minimum by the presence of wide openings on the yoke.

Perfect lubrication and the minimizing of wear are brought about by numerous well-placed oil cups.

All these features are combined with Sheldon design and construction to make the greatest truck axle ever put on the market.

But not content with our product in itself, we are going one step further and we offer with our 1913 axles the following bearing equipment:

Standard Tapered Roller Bearings.
Bower Straight Roller Bearings.
New Departure, Rhineland, F & S, Hess-Bright, or any standard Double Row Annular Bearings.
Single Row Annular Bearings can be supplied without difficulty by using spacers.



This combination of the Sheldon Heavy Service Axle with a choice of any of the world's best bearings should not be overlooked by the truck manufacturer who wants the best.

Bower Roller Bearings

Right in Design Right in Quality Right in Service

A BEARING is only a small thing and yet it has a vital and important relation to the whole car. It affects service, affects fuel consumption, affects tire economy, affects power, affects ease of repair and adjustment.

As automobiles become more refined, as engineers pay closer and more scrutinizing attention to details the sale and use of Bower Roller Bearings increases.

For engineers, and all who deal with the public, realize that the less you leave for the public to do in the caring for a mechanical device of any kind the greater is the certainty of giving complete satisfaction.

And the use of Bower Roller Bearings entirely eliminates the necessity of one kind of adjustment that must be made when other types of roller bearings are used.

Bower Roller Bearings are non-adjustable radially. End play can easily and quickly be regulated without changing the RADIAL alignment; the RADIAL alignment never requires adjustment.

The body of the roller carries the RADIAL load; one end of the roller carries the end thrust, independent of the RADIAL load. Thus increasing the RADIAL load does not increase the end thrust; nor does increasing the end thrust increase the radial load.

To accomplish this in a single bearing unit without combining the radial and end thrust in a single element, is to achieve the highest type of roller bearing efficiency—and that is exactly what we claim for the Bower.

Every Bower claim is susceptible to proof—and the increasing use of Bower Roller Bearings—now in their fourth successful year—points unmistakably to the fact that we are "delivering the bacon."

Made in all regular standard sizes. Interchangeable with all the prominent makes of ball or roller bearings.

Get in touch with our engineering department, or write for full details.

We will exhibit at the Coliseum Annex, Chicago—glad to see you

KELLY MOTOR TRUCKS

EXPERIENCE has taught THE KELLY-SPRINGFIELD MOTOR TRUCK COMPANY how to design and build the best high-efficiency motor transports. Experience has taught us that to build a big and permanent success in our chosen field of endeavor we must: first, build honestly and well; and second, equip with service facilities at factory, at our branch houses and at our agencies throughout the country so that Kelly motor truck users may be assured, as nearly as possible, 100 per cent service satisfaction for years after our product becomes their property.

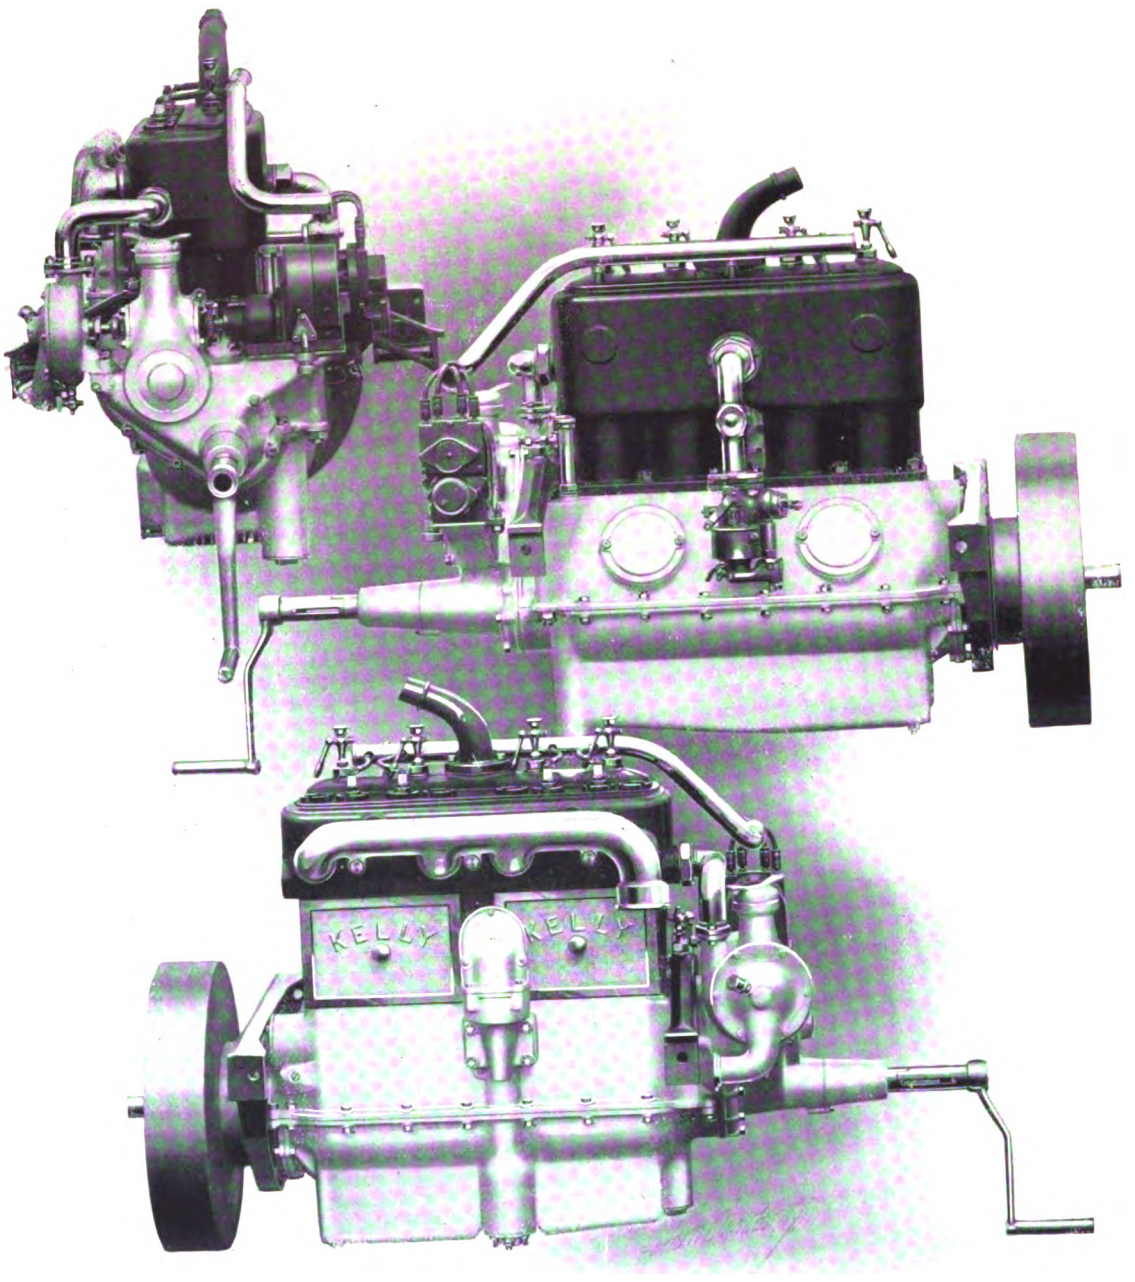
The prospective buyer of motor truck equipment, in this era of enlightenment—be the installation one or a half-hundred chasses—realizes that when he has found the best designed and best built equipment, his responsibility to himself, or the corporation he represents, is but half discharged. In reality it is less than half discharged.

The buyer must go under the surface of things. He must go deeper than the mere chassis.

Is it the product of a thoroughly responsible manufacturing corporation—responsible both financially and morally?

Are the men who designed and who manufacture the product masters in their respective departments?

Are they able and always willing to back up their product to the limit?



What are the manufacturer's facilities in the territory throughout which the truck, or trucks, are to be operated, with respect to giving service—not merely for a month, or a year after purchase, but five or ten years thereafter?

We buy a pleasure car and, after one or two seasons' use, sell or trade it for a new car—a later model in which we take increased personal pride in the driving. The staying qualities, the lasting responsibility of the manufacturer is not so serious. But with motor trucks—our commercial servants—it is quite a different matter.

The motor trucks you buy to-day are expected to stand up and deliver high transportation efficiency for years to come. And why not?

The right selection now, as regards design, quality of materials, carefulness of scientific manufacture, the ability and willingness of the builders to stand with you

Digitized by Google

Intake and Exhaust sides and front views of the K-30 Motor. Note that valve springs and stems are completely housed and protected

Digitized by Google

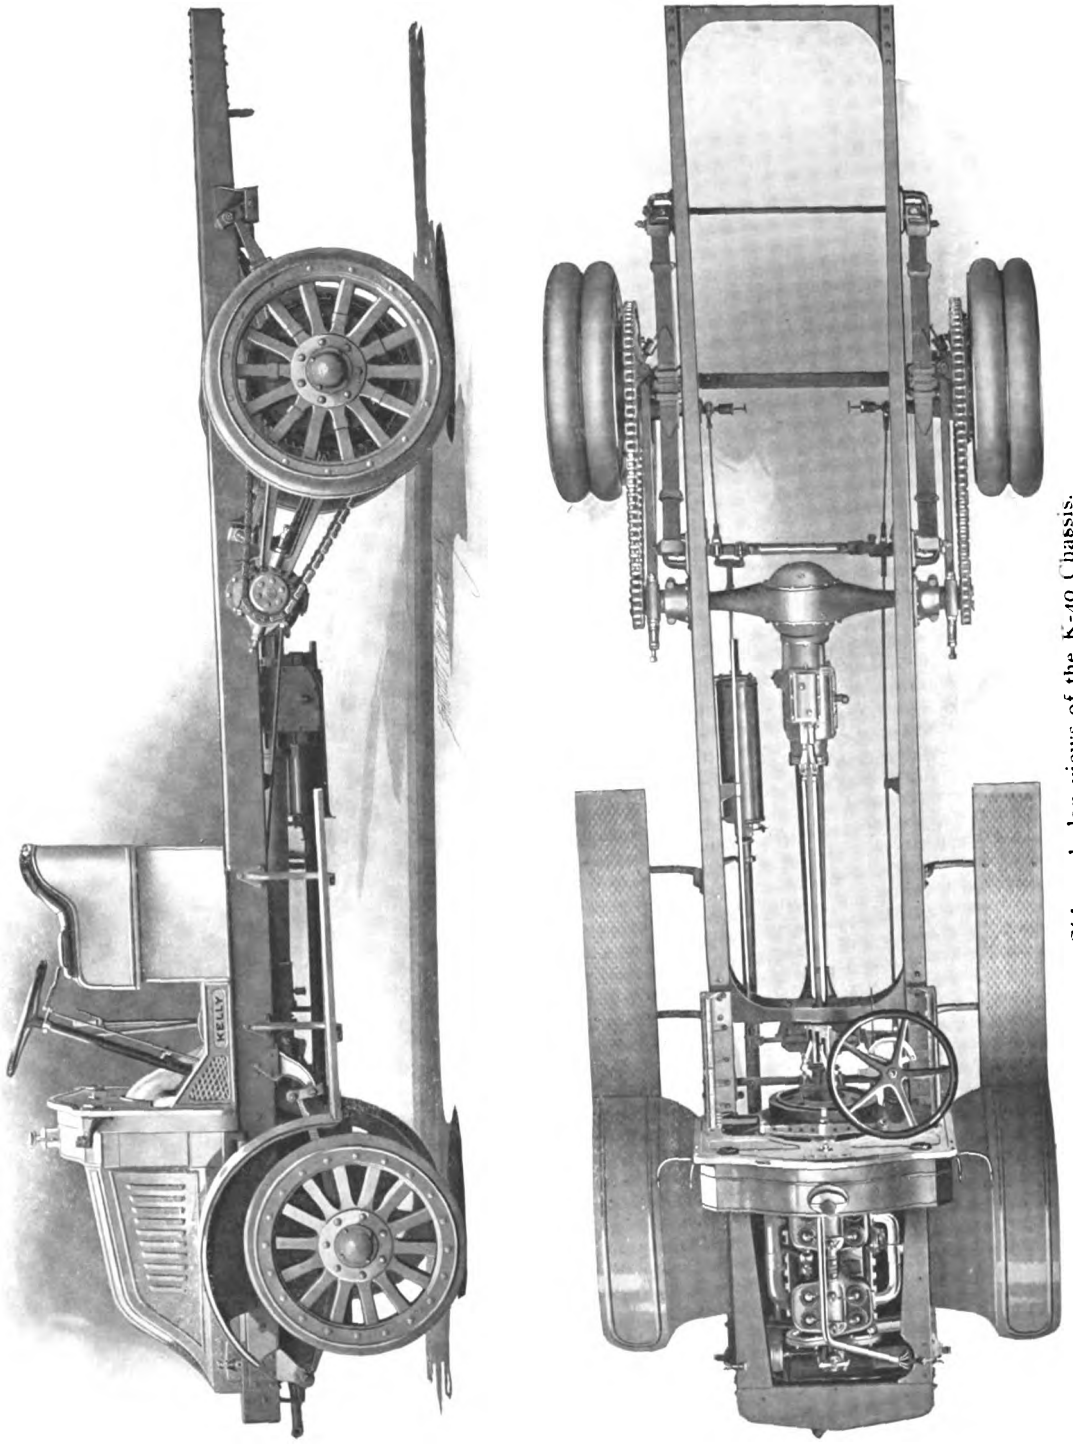
and for you during the years following your purchase, mean that you have made the great big step in the direction of satisfactorily mastering your problems of transportation.

You at once promote the advantage of your patrons by insuring quicker delivery than possible by older methods. And that advantage to your patrons is your advantage—your advantage multiplied.

Your radius of action trebles. You reach out and are able to conquer in avenues of new business where your earlier limited delivery radius meant impossibility.

Simultaneously with the adoption of motor trucks in your delivery system you reduce the costs per ton mile to such a degree that the economy of motor trucks presents such a decided item of advantage that you regret not having adopted them long ago.

Did you delay earlier purchase in order that someone else might blaze the trail? Perhaps. In passing, however, we wish to thank many hundreds of those "trail blazers" whose patronage we have appreciated during the years since we, as pioneers in the industry, began the manufacture and marketing of motor trucks in America.



During these years we have learned many valuable lessons. We have learned much along lines of what *not* to do. We have been, and are, exclusive motor truck manufacturers. We do not build touring cars with motor trucks as a "side line." The manufacturing and marketing of high-efficiency motor transports is our business.

KELLY PRINCIPLES OF CONSTRUCTION

IT is a fundamental principle of mechanics that a structure designed to give under stress is much more durable than one which must resist pounding and vibration by its rigidity alone. There are, accordingly, two methods open to the truck designer: he may either attempt to make everything so hard and fast that it will resist, by its strength alone, the severe pounding to which a truck is always subject in daily service, or he may so design the machine that every part gives to the blow and cushions its effect by *not* resisting it. The Kelly design embodies the common-sense method represented by the *flexible* form of construction. This not only increases durability but permits the building of a lighter truck with higher load efficiency.

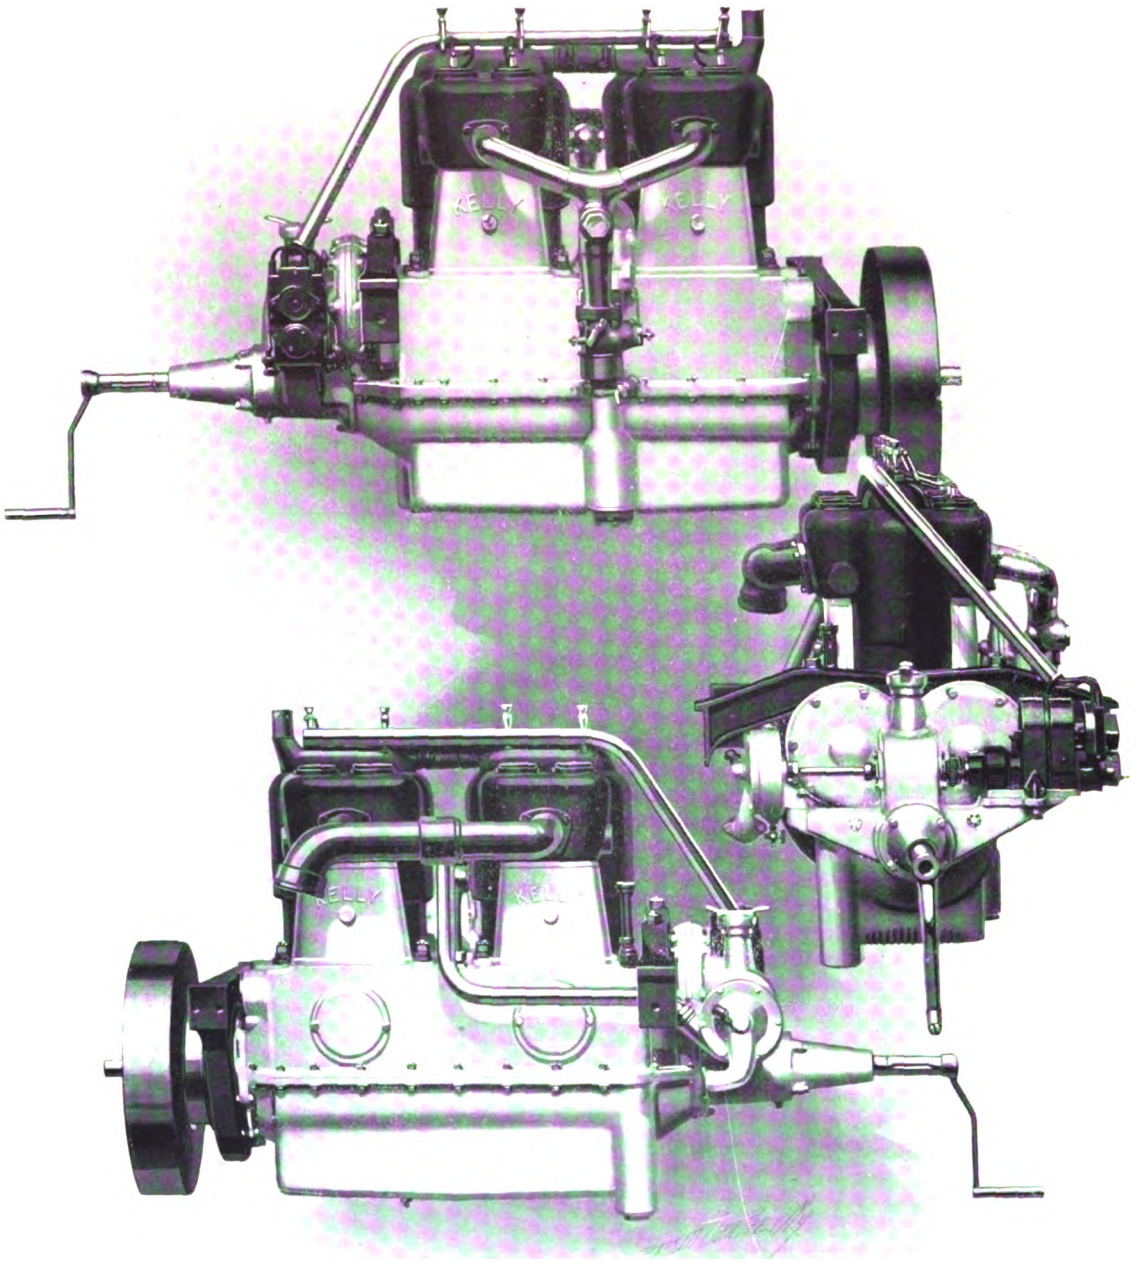
The Kelly motor is mounted on a three-point flexible suspension, the forward support consisting of a steel drop forging, the ends of which are bolted directly to the frame side members so that the crank case is relieved of the stresses usually imposed upon it. The third-point support at the rear is a large swivel joint which allows the frame to adjust itself to the inequalities of the road without imposing any strain on the motor bearings. The alignment of the latter accordingly is never disturbed, and there is no loss of power or wear on the bearings due to the twisting of the frame. The motor and clutch form one unit, while the countershaft, carrying the differential and transmission, form a second unit. The driving shaft is enclosed in a torque tube, and all relative movement is taken care of by a

Digitized by Google

Side and plan views of the K-40 Chassis.

Digitized by Google

double universal joint between the clutch and the driving shaft. The forward end of the torque tube is attached to the central cross member of the frame by a double swivel joint, while the front ends of the radius rods are mounted on the countershaft on large ball and socket joints, and the rear ends of these rods at the rear axle are carried on double swivels. The three-point suspension of the motor, combined with this effective use of universal joints, provides for relative movement right from the crank shaft back to the wheels, so that the entire construction is flexible, and tends to *give* rather than to *resist* heavy shocks. On both the one and three-ton Kelly trucks pressed steel frames of liberal dimensions are employed, the one-ton frame being 4½ inches deep, while on the three-ton the channel section is 7 inches deep and ¼ inch thick. Only one cross brace is necessary in addition to the usual front and rear ends. There is, accordingly, a minimum necessity for drilling and riveting to the side members of these frames, and they will successfully withstand the continuous twisting to which a truck is subjected under heavy loads, without the tendency to "loosen-up" that is unavoidable in a rigid, stiffly trussed frame. This flexible construction of Kelly trucks permits the motor to deliver the maximum percentage of its power at the rear wheels. There is no waste through mis-alignment or binding of the crank shaft or other bearings, inevitable when they must resist the twisting of the frame.



MATERIAL AND WORKMANSHIP

Correct principles are the very foundation upon which the successful motor truck must be built, but principles alone will not make an enduring and serviceable machine. They must be embodied in good material machined to the closest degree of precision. The high standards we have always maintained in the construction of every part of Kelly trucks have been responsible for their success quite as much as the fact that their design is based upon the correct principles. Parts that move together, or upon one another, must be finished in a manner ordinarily associated with the work of the jeweller if wear is to be avoided. As a matter of fact, jewellers' measurements have become crude by comparison with the fine standards adhered to in the making of many parts of Kelly trucks.

Machinery is ordinarily finished to what is termed commercial limits of precision, *i. e.*, as fine as they may be made by the usual methods, but in the manufacture of a machine that must endure the hardest class of service, such as Kelly trucks are subjected to in a great many different lines of business, the ordinary commercial standards are far from being fine enough. There are two hundred operations in the construction of a Kelly motor truck in which the limit of error is held to one-thousandth of an inch; twenty operations in which the limit of error is between one-thousandth and one two-thousandth of an inch, and thirty operations in which the permissible inaccuracy does not exceed one four-thousandth of an inch.

These differences are practically microscopic—they cannot be detected except by the finest precision measuring instruments. Such exceptional precision requires the use of expensive duplicating jigs and fixtures, and also the highest grade of skilled labor. That the maintenance of such a high standard is worth while is best

Digitized by Google

Clean-cut simplicity of the K-40 Kelly Motor. The Power Plant of the Kelly Three-ton Truck

Digitized by Google

evidenced by the success of Kelly motor trucks in service; wear is reduced to a minimum and when replacement of parts is necessary, the new ones fit absolutely.

The flexible unit principle of Kelly motor trucks is supplemented by an interchangeable unit construction which eliminates guesswork and rule-of-thumb methods in assembly.

LOAD DISTRIBUTION

The power-plant of the Kelly motor truck is placed under a hood, where both engineering principles and the needs of daily service indicate it should be. The value of a motor truck lies in its ability to carry the largest paying load, but to keep its efficiency up to the maximum, that load and the weight of the truck itself must be properly distributed. In the Kelly one and three-ton trucks eighty per cent of the total weight is on the rear wheels, twenty per cent on the front wheels. Placing more than eighty per cent of the load on the rear wheels increases the wear on tires without corresponding advantage. It is often claimed that placing ninety per cent, or more, of the total weight on the driving wheels will increase the traction, but experience has proven the contrary. In addition to the advantages of better load distribution and less wear on the tire equipment, the location of the motor under the hood makes every part instantly accessible.

KELLY WATER-COOLED MOTORS

With the experience of many years of truck building and the knowledge gained from hundreds of trucks in daily service, Kelly water-cooled motors have been designed to give the maximum efficiency and dependability under the most severe working conditions. Both the one-ton and the three-ton motors are of the slow-speed, long-stroke type, designed to work continuously under full load. The number of parts has been reduced to the minimum, and the design of the motor is extremely simple. High-grade materials make it possible to keep the weight down to the minimum. With the exception of the magneto driving shaft, all moving parts are enclosed. The oiling, ignition and cooling systems are all self-contained, while the motor is effectually governed not to exceed a speed of 1200 revolutions per minute on the one ton and 900 on the three ton. There is, accordingly, no opportunity for an unskilled driver to tamper with the motor, or abuse it by "racing," as this is prevented by the positive acting governor.

KELLY K-30 WATER-COOLED MOTOR

The dimensions of the one-ton, K-30 motor are 3¾ inches bore by 5¼ inches stroke. The four cylinders are of the L-head type in a single casting, which makes the motor compact. At 1200 revolutions per minute, to which the motor speed is controlled by the governor, the K-30 develops 25 horse-power.

The most important features of a gasoline motor designed for commercial use are the oiling, cooling and ignition systems, and these have been given particular attention. The lubricating system is entirely self-contained, consisting of an oil reservoir forming part of the lower half of the crank case. At the bottom of this reservoir is placed a high pressure pump driven through spiral gears at half the

Digitized by Google

engine speed from the cam shaft. This pump forces oil at the rate of several gallons per minute through the hollow crank shaft to the main bearings, crank pins, connecting-rod bearings and pistons. It is commonly known as the dry-base system, as no lubricant is allowed to splash around in the crank case, all excess immediately finding its way back to the pump, which again circulates it. This gives a constant circulation of a large quantity of oil over all bearings while the motor is running.

Ignition is provided by an Eisemann automatic advance type magneto so that this important feature of the control is taken out of the driver's hands. A careless or unskilled hand cannot abuse the motor. Both the magneto and the centrifugal water pump are accessibly located at the forward end of the motor, where they are driven by a short transverse shaft and spiral gears. The oil sight-feed is also located at the front end of the motor, and is visible upon lifting the hood. With hood lifted, every part of the motor is made as accessible as if it were on a bench. This location of the magneto takes it away from the heat and the dirt, as well as the risk of being wet by either gasoline or water.

The radiator is of the tubular type which affords the most durable construction, and is built as part of the dash. It is carried on a flexible suspension which prevents damage consequent upon twisting of the frame or similar stresses. The centrifugal pump circulates the water around the exhaust valves and out at the tops of the cylinder heads and through large diameter tubing to the radiator. An aluminum fan, mounted directly in the center of radiator and driven by a belt from the fly wheel, provides a strong and efficient circulation of air, insuring proper cooling under all conditions of road, load and temperature.

KELLY K-40 WATER-COOLED MOTOR

The same principles of design and the same refinements of construction are followed throughout in the Kelly three-ton motor as in the K-30 model, practically the only difference being in the dimensions. The K-40 motor differs slightly in having T-head cylinders cast in pairs instead of the *monobloc* of the smaller motor. These dimensions are 4½ inches bore by 6½ inches stroke, and, at its normal speed of 900 revolutions per minute, to which the governor restricts it, it produces 38½ horse-power. Apart from the slight difference mentioned, all of its features of design, construction and control are identical with those of the smaller motor, and this also holds good for every other feature of the truck, the clutch, transmission and drive, all being built on the flexible unit principle. The dimensions throughout have been made extremely liberal for the load rating of the truck. It is a common practice to abuse motor trucks by greatly overloading them, and we have accordingly rated Kelly trucks at moderate capacities as compared with their actual carrying ability.

This does not mean that the Kelly one-ton truck is designed to carry two or three tons, nor that the Kelly three-ton truck is meant for five or six-ton loads, but both are designed to give reliable service day in and day out under the most severe conditions, and ample allowance has been made for the occasional excess loading which is unavoidable.

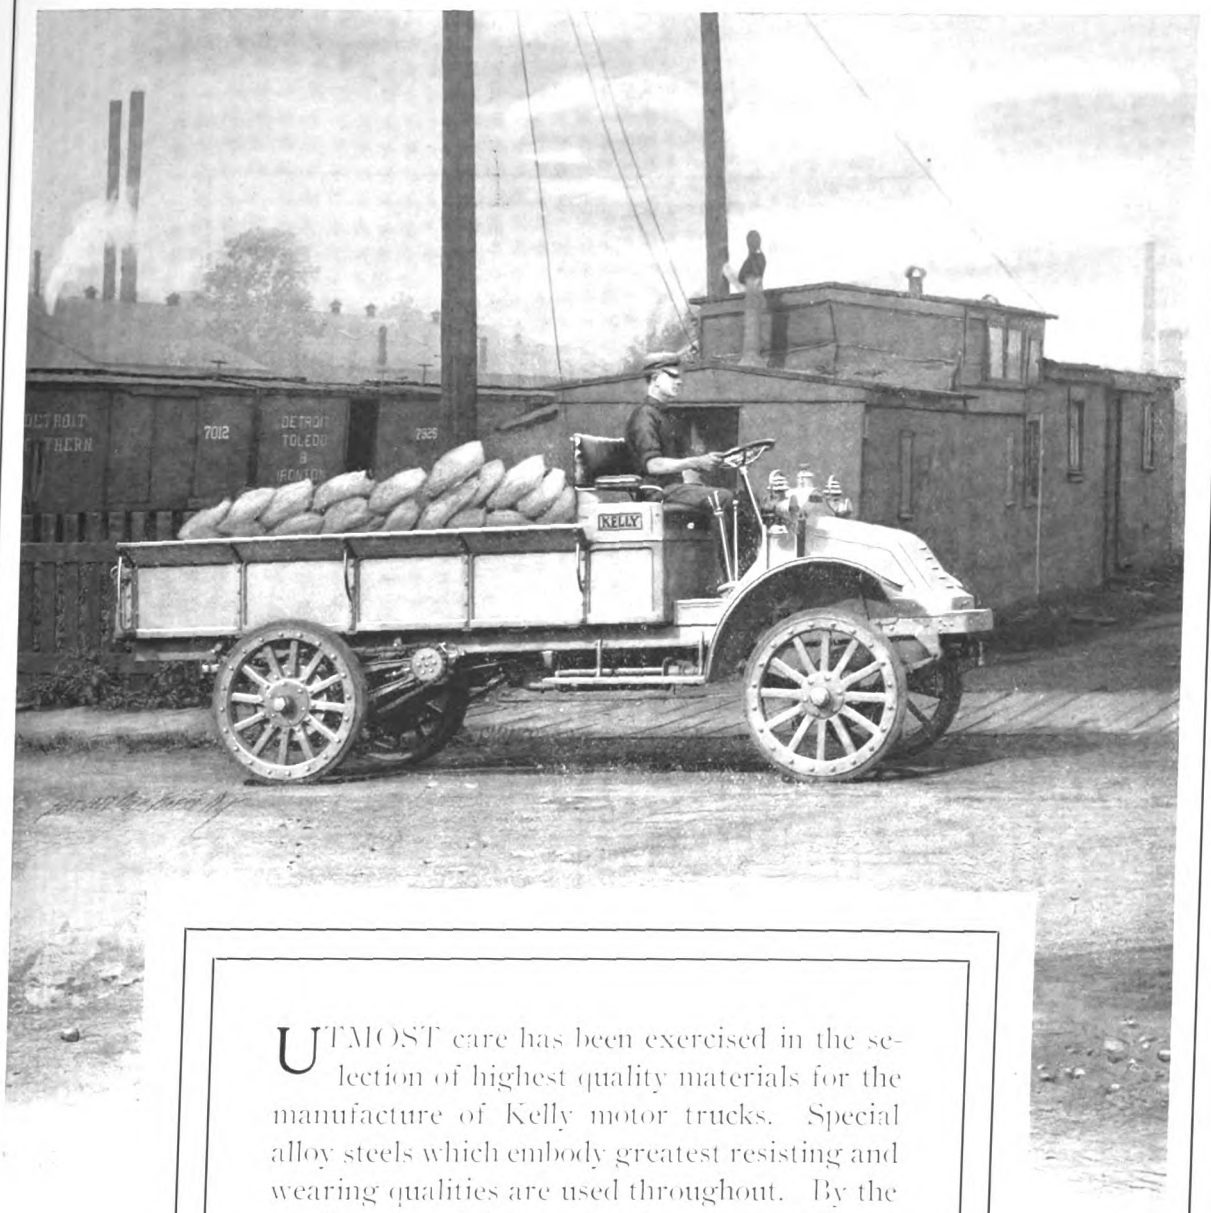
SPECIFICATIONS K-30 (1-TON) KELLY MOTOR TRUCK

NORMAL LOAD CAPACITY 2000 POUNDS

Motor	Four-cylinder, water-cooled, on three-point support.
Cylinders	3¾ inches bore by 5¼ inches stroke, L-head type in *monobloc* casting.
Horse-power	25 horse-power at 1200 revolutions per minute.
Lubrication	Self-contained automatic system, circulating oil constantly by gear-driven pump.
Ignition	Eisemann automatic spark advance high-tension magneto. A self-contained ignition system with which it is impossible to tamper.
Cooling	Tubular radiator, built in dash and mounted on flexible support. Gear-driven centrifugal pump at forward end of motor. Belt-driven aluminum fan back of radiator.
Governor	Vertical ball type direct connected with throttle.
Motor Control	By throttle only, magneto automatically taking care of spark advance.
Clutch	Aluminum cone faced with chrome-tanned leather, directly engaging fly wheel.
Transmission	Three-speed and reverse, selective type, built as unit with differential on jack shaft. Transmission shafts in vertical plane, giving access to gears without removing load or body.
Control	Left hand, with levers in center at driver's right.
Drive	Double side chains, heavy roller type.
Final Gear Ratio	6⅔ to 1.
Axles	Front: I-beam one-piece drop forging with nickel-steel steering knuckles and spindles. Rear: I-beam chrome-nickel steel forging 3 x 2-inch section.
Bearings	Hyatt high duty, and Standard roller bearings.
Springs	Semi-elliptic, 40 inches front; 42 inches rear.
Brakes	Both sets internal expanding type in drums on rear wheels. Dimensions, 16 x 2 inches.
Wheels	Artillery type, square spokes of 2-inch section, S. A. E. detachable rims.
Tires	36 x 3½ inches solid, front; 36 x 4 inches solid, rear.
Wheel Base	Standard, 120 inches; option, 144 inches.
Chassis Length	Standard, 15 feet 6 inches over all; optional, 18 feet 6 inches.
Tread	Front wheels, 56 inches; rear wheels, 60 inches.
Frame	Pressed steel channel section $^{7}/_{32}$ inch thick, by 4½ inches deep. Length of standard frame, 9 feet; special frame, 12 feet, back of driver's seat.
Percentage Chassis Weight on Rear Axle	50 per cent.
Percentage of Full Load on Rear Axle	80 per cent.
Fuel Tank Capacity	15 gallons. Located under driver's seat.
Water Capacity	9 gallons.
Oil Tank Capacity	2¼ gallons.
Normal Road Speed	Standard, 15; option, 18 miles per hour—controlled by governor.
Price of Chassis	Complete with driver's seat, oil side and tail lamps, full set of tools and jack—$2000, f. o. b. factory.



Digitized by Google

SPECIFICATIONS K-40 (3-TON) KELLY MOTOR TRUCK

NORMAL LOAD CAPACITY 6000 POUNDS

Motor	Four-cylinder, water-cooled, three-point suspension.
Cylinders	4½ inches bore by 6½ inches stroke, T-head, cast in pairs.
Horse-power	38½ horse-power at 900 revolutions per minute.
Lubrication	Self-contained automatic system, circulating oil constantly by gear-driven pump.
Ignition	Eisemann automatic spark advance high tension magneto. A self-contained ignition system with which it is impossible to tamper.
Cooling	Tubular radiator built in dash, and mounted on flexible support. Gear-driven centrifugal pump at forward end of motor. Belt-driven aluminum fan supported back of radiator.
Governor	Vertical, loose ball type, direct connected with throttle.
Motor Control	By throttle only, magneto automatically taking care of spark advance.
Clutch	Aluminum cone, faced with chrome-tanned leather, directly engaging fly wheel.
Transmission	Three forward speeds and reverse, selective type, built as unit with differential on jack shaft. Transmission shafts in vertical plane, giving access to gears without removing load or body.
Control	Left hand, with levers in center at driver's right.
Drive	Double side chains, heavy roller type.
Chains	1¼-inch pitch.
Driving Gear Ratio	11½ to 1.
Axles	Front: I-beam one-piece drop forging with nickel-steel steering knuckles and spindles. Rear: I-beam, drop forged, special Kelly design.
Bearings	Hyatt high duty, and Standard roller bearings.
Springs	Semi-elliptic, 48 x 3 inches front; 56 x 3 inches rear.
Brakes	Both sets internal expanding type in drums on rear wheels. Dimensions: service brake, 20 x 3 inches; emergency brake, 20 x 2½ inches.
Wheels	Artillery type, 2½x3 inches rectangular section, S.A.E. detachable rims.
Tires	38 x 5 inches single in front, 42 x 5 inches dual in rear.
Wheel Base	Standard 150 inches; options, 120 and 172 inches, or any intermediate length.
Standard Chassis Length	19½ feet over all.
Tread	Front wheels, 68 inches; rear wheels, 72 inches.
Frame	Pressed steel channel section ¼ inch by 7 inches deep, 3 inches top and bottom. Length of standard frame back of driver's seat, 12 feet, 3 inches; special frames, 9 feet, 10 inches; 15 feet, and 17 feet.
Percentage Chassis Weight on Rear Axle	50 per cent.
Percentage of Full Load on Rear Axle	80 per cent.
Fuel Tank Capacity	20 gallons.
Water Capacity	15 gallons.
Oil Tank Capacity	2¾ gallons.
Normal Road Speed	11½ miles per hour—controlled by governor.
Price of Chassis	Complete with driver's seat, oil side and tail lamps, full set of tools and jack—$3400, f. o. b. factory.

UTMOST care has been exercised in the selection of highest quality materials for the manufacture of Kelly motor trucks. Special alloy steels which embody greatest resisting and wearing qualities are used throughout. By the employment of these expensive alloys minimum weight with maximum strength is the result attained. This big and important advantage is decidedly favorable to Kelly motor trucks.

Digitized by Google

KELLY SERVICE

THE final test of the efficiency of a motor truck is service. The sale of a truck is only the beginning of the manufacturer's responsibility.

Do you realize what real factory service means to the man who sells a truck?

Kelly service is legitimate service in every sense of the word.

We can give real service because we have built up the Kelly organization with that idea in view.

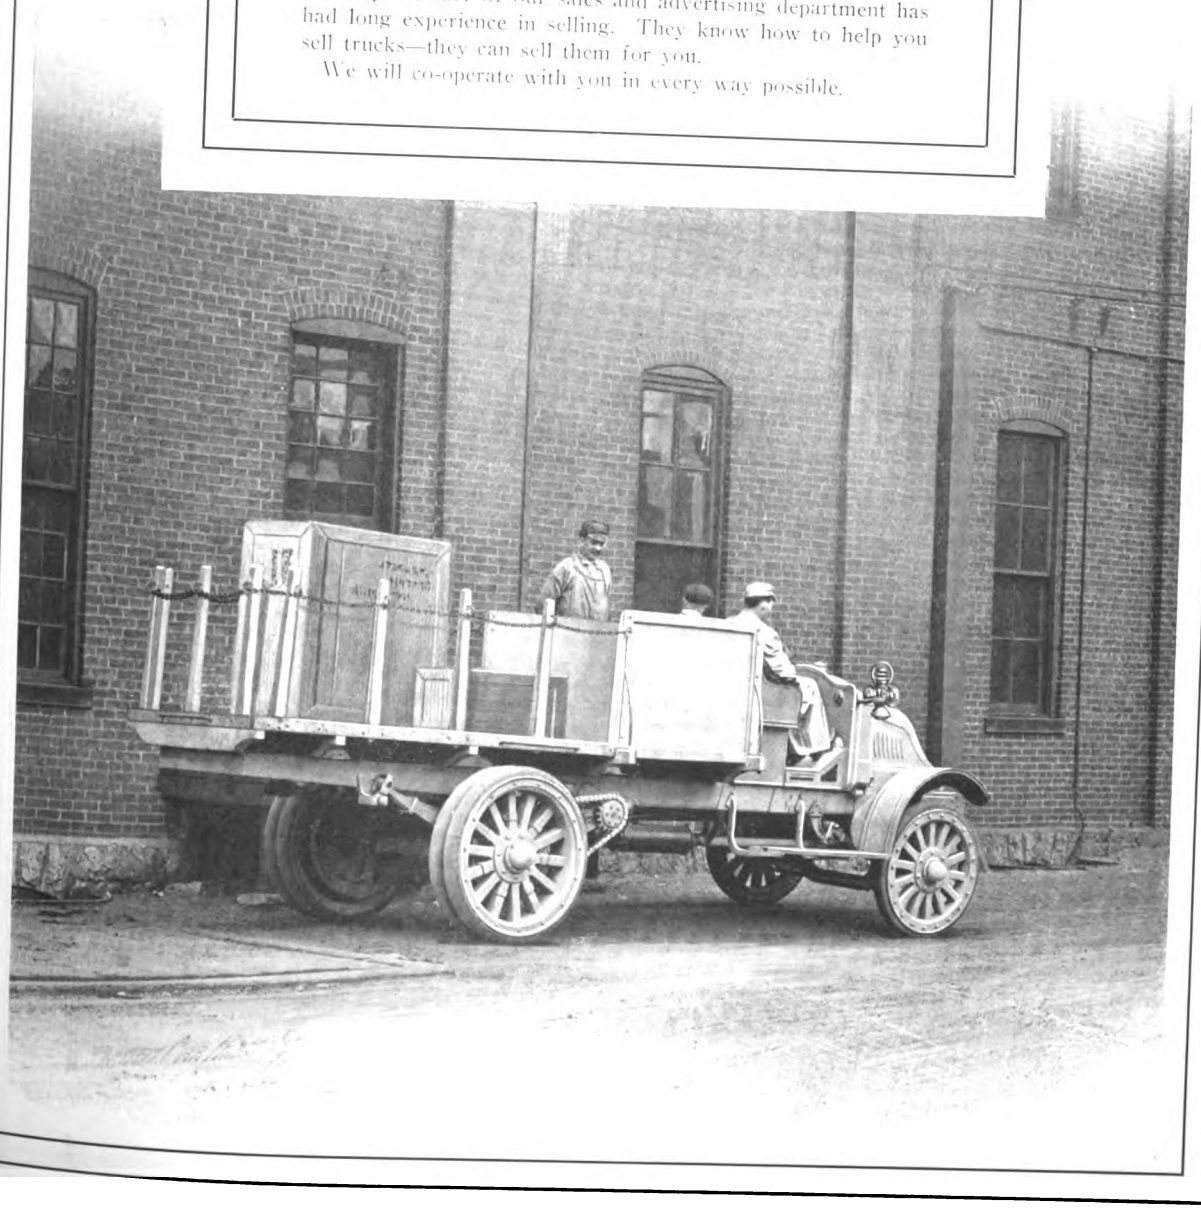
We operate well-equipped factory branches and service stations in the following cities:

Boston	Dallas	Chicago
Providence	San Francisco	Kansas City
Worcester	New York	Seattle
New Haven	Philadelphia	Los Angeles
Cleveland	Birmingham	

Every city and town in the country is within a few hours of one of these service stations. The necessary equipment for

Digitized by Google

any repairs can be dispatched to any dealer without an instant's delay, and delivered within a few hours. The advantage of this arrangement can be seen readily by those who have often been compelled to wait many days for the arrival of repair parts from a distant factory.



KELLY SALES HELPS

OUR sales and advertising department is designed primarily to sell Kelly trucks for you. We will help you in every way possible.

A large sum of money will be spent in advertising and sales promotion work in 1913. We will employ every legitimate means to promote your sales.

Every member of our sales and advertising department has had long experience in selling. They know how to help you sell trucks—they can sell them for you.

We will co-operate with you in every way possible.

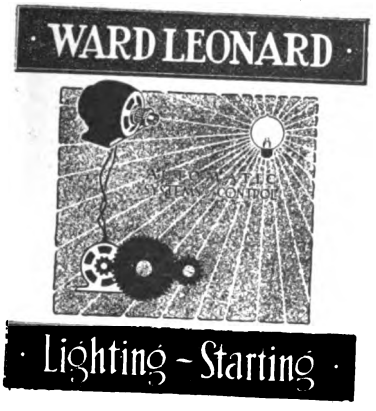
Digitized by Google

THE LAST WORD

IN conclusion we urge upon you the importance of telegraphing at our expense if you, as THE live Dealer, want the best motor truck account in America.

We are prepared to go the limit with you to get the cream of the motor truck business in your territory.

Don't wait to see us for the Chicago or any other motor truck show.



Telegraph immediately at our expense and arrange to have territory assigned you.

The Ward Leonard System

With Real Automatic Control

The perfection of the Ward Leonard System is due to the fact that Ward Leonard is electrical and mechanical experience combined.

The latest and best forms of heavy electric hoisting machinery are operated under Ward Leonard Systems of control. Hoists which employ as high as 1500 H.P. and which are driven vertically at the rate of 40 miles an hour are perfectly controlled by Ward Leonard Systems.

This control results in a marked increase of the output, greater economy and absolute safety.

Steel rolling mills in Germany alone save millions of dollars because their immense rolls, a single set of which frequently requires 12,000 H.P. to operate, are electrically controlled by Ward Leonard Systems.

It is apparant then, that all problems of electrical control in the case of mills, heavy machinery, and the like, have been satisfactorily met by the Ward Leonard Systems of Control.

The application of this specific knowledge of electrical and mechanical control to the automobile industry has made it possible for the Ward Leonard Company to offer motorists and manufacturers a starting and lighting system that is efficient, simple and reliable because it is based on scientifically correct principles of control.

Time and test have proved our claims. Our system is the result of a quarter of a century of evolution and our experience is your guarantee.

FEDDERS

Square Tube

Radiators

Water All Around

Repaired At Home

The water channels in Fedders Square Tube Radiators are vertical and horizontal, open on all four sides, guaranteed to give maximum cooling surface.

This form of construction is right and logical—a fact admitted and acted upon by engineers of many of America's best known cars—and in these days the wise manufacturer takes no chances of endangering the popularity of his car by gambling on parts of problematical value—more especially radiators.

Dealers who sell cars equipped with Fedders Radiators can repair broken tubes with a pair of tinner's irons. No expensive delays in returning to the factory.

Highest cooling efficiency, long life, easy repairs—this is the whole story of Fedders supremacy.

Note that while we specialize on Square Tube Radiators, we are also equipped to produce radiators of any type and in any quantity over specifications furnished. Get in touch with our engineering department.

Schafer Ball Bearings Insure

Smooth and Silent Operation

THE CAR THAT RUNS SMOOTHEST lasts longest—the noiseless car conserves its power and efficiency indefinitely. Smoothness and silence are the indications of frictionless operation—a prime necessity in motor car endurance. Friction means rapid and costly depreciation. No mechanism can long endure when the bearing points are centers of discord and grinding wear.

SCHAFER BALL BEARINGS offer the best solution of the friction problem. They are the anti-friction bearings par excellence. Although in theory friction always will develop where steel moves over steel, Schafer Bearings reduce the coefficient to so low a degree as to be practically negligible. They are the highest grade and finest quality of ball bearings made in the world today.

THE CHROME STEEL used is of special analysis, close in grain and fine in texture. The balls are accurate in dimensions and sphericity, uniform in size to within one ten-thousandth of an inch. We were first to employ 95 per cent. of balls in the raceway. Our cage design has not changed in years, for it was correct in principle from the first. Schafer Ball Bearings are standard equipment on the best cars of Europe and America. Of course, there's a reason.

Two questions a Dealer should ask himself when considering the representation of a Motor Truck Manufacturer :

Which Truck will give the most satisfaction to my customer ?

The truck which is built to perform the service expected of it, and which possesses exclusive points of economy and superiority.

The A&R Motor truck represents accumulated results of eight years careful study and scientific development with the most severe road tests. Through these tests, it has been demonstrated that the A&R truck is more than capable of meeting every possible condition.

A&R CONSTRUCTION

"Study the lines" : —They represent power and efficiency — far in excess of their rated load capacities, combined with minimum weight and great strength. Many features of the A&R truck are exclusive—collectively they represent the highest type of motor vehicle construction.

CAPACITY

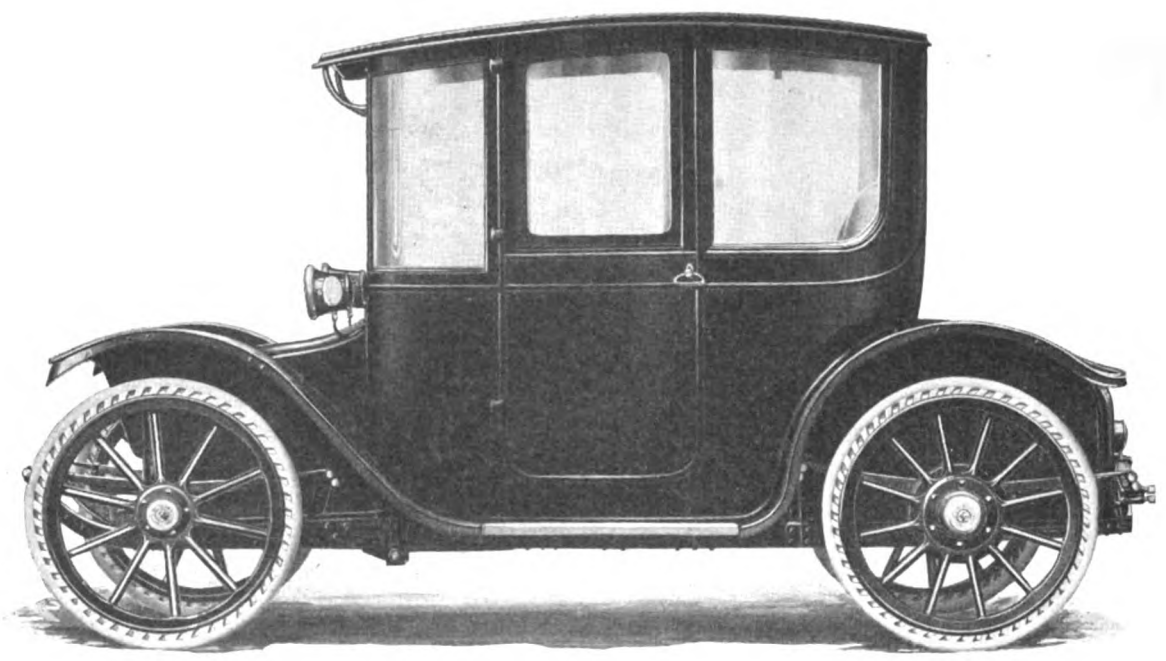
Heavy service—three, four and five tons.

Which Company will give me the best co-operation, not only in the sale, but in rendering service to my customer ?

The Company which is firmly and substantially established; thereby assuring permanence, situated to render service to owner and dealer, and willing to co-operate with him in compelling attention and consideration for the truck through publicity.

The Abendroth & Root Manufacturing Company, is an engineering corporation, whose products have been recognized standards throughout the engineering world for over forty-five years, thereby insuring sterling quality and dependable service for every A&R truck.

A&R SERVICE



A thoroughly equipped factory at Newburgh, N.Y., in close proximity to New York City, has a factory service department, where the most efficient co-operation is available to every dealer and purchaser of an A&R truck.

WE have an interesting proposition, with a generous margin of profit, for a live dealer in your territory. The demand for high grade motor trucks, already exists, and will be further stimulated by our advertising assistance, and co-operation with the dealer. Write or telegraph us now for more complete information.

Some of the most desirable territory in the Middle West and West has not yet been closed.

That means several big opportunities for dealers of standing and ability. You'll find full details—and the car itself—at Space 8, Basement of the Annex, Chicago Show.

Century ELECTRIC

is a car of distinguished personality. A car of superb proportions and simple elegance.

The low, underslung body, scientifically suspended on long, flexible springs, makes it peculiarly an easy riding car and one that sticks close to the ground. It almost can't overturn, or skid.

There isn't anything finer in the Electric field.

Don't fail to see it and get the dealer proposition.

MATHER

Scientifically Heat-Treated Springs

THERE is no better example of the advancing strides being made in the Automobile and Motor Truck Industry, than is shown by the demand of the Manufacturer that all vital steel parts be **Scientifically Heat-Treated.**

It is an obvious fact that little or no effort has been made by the Old Line Spring Shops to enhance their product by intelligent Heat-Treatment—due partly for want of proper equipment and partly to indifference. This fact, more than all others, is accountable for the large percentage of broken and soft springs, of which the Motor Car Manufacturer now complains.

Our plant has been designed and equipped expressly with a view of **Heat-Treating Springs Scientifically.**

The Electrical equipment used throughout our entire plant, controlling the necessary heats, is considered by far the most efficient obtainable; and is the type most generally used for laboratory work.

We guarantee every spring turned out by us to be Scientifically Heat-Treated.

A visit to our plant will convince you that we can materially reduce your spring troubles.

To the DEALER

These instruments embody quality that insures integrity of speed and time measurements year in and year out. This quality then means right design, accuracy in machining and assembling and metals that must conform to the high laboratory standards set for them.

In these days of strenuous business competition, quality is sometimes sacrificed to increase publicity and to lessen sales resistance. Advertising overhead charges when carried to excess, must be taken from quality of product.

Hoffecker and Waltham products are conservatively, but effectively, advertised in that this publicity goes direct to, and exclusively to car owners and prospective owners.

RIMS  RIMS

THE RIM BASE OF
STANWELD
RIM No. 30

Will Fit the Felloe Band of Either the Continental or Standard Universal No. 3 Rim

SEE OPPOSITE PAGE

Digitized by Google

Rim Base of STANWELD Rim No. 30 With Tire Applied

IF your car is equipped with Continental or Standard Universal No. 3 Demountable rims, you can completely re-equip with No. 30 STANWELD Rims in less than one hour and with very little expense.

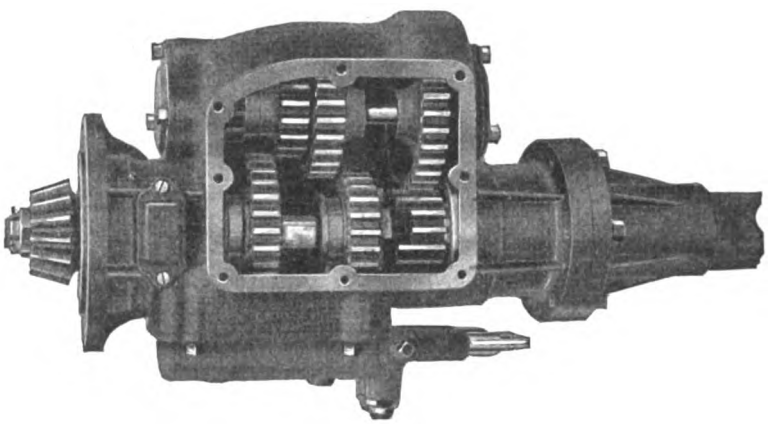
All that you need are the No. 30 rim bases. They fit perfectly the felloe band of either of the above mentioned types and can be applied without the necessity of any special wheel work or the addition of any bolts, wedges or special tools.

Merely remove your old tire rims from the wheels, apply your tires to the new rims, replace the rim with tire on the wheel, screw up your wedges and you have a complete set of new rims.

STANWELD Rim No. 30 is a vast improvement over all former similar types. It is operated without a special tool. Rust and freezing cannot interfere with its operation. Circumferential movement of either section is not necessary to detach a tire.

Merely open a small swinging latch with a screw driver, pry loose the ends of the two flat semi-circular spring rings which fit over corresponding lugs of both sections. The two sections of the rim base can then be separated for removal of the casing or tire. The locking rings can be replaced with the fingers in a very short time.

All the old difficulties experienced with the other types are completely eliminated. The rim itself is light, strong, extremely simple and easy to operate. The expense involved is so low that the oldest car can economically be re-equipped with the No. 30 STANWELD rim, provided its former equipment was either Continental or Standard Universal No. 3 rims.



Write to us, giving the present size of your rims and we shall furnish you with a descriptive folder giving prices. This is absolutely the best rim offer that has been made to the motoring public for many years.

COVERT

Covert Recognized Because Specialized

This year many more leading models show Covert Rear Axle Transmissions and Covert Jackshaft Transmissions, than ever before. There must be merit to warrant this growing popularity.

Fourteen years ago we exhibited the first Rear Axle Transmission. Our confidence in the advantages of this construction, at that time, has been justified by its converts, including many of the leading engineers in this country and abroad. These advantages apply with equal force to the manufacturer, and the man who operates the car.

We maintain a staff of able engineers, who will gladly go over your transmission problems with you.

We specialize on Transmissions designed for direct attachment to rear axle or jackshaft, and practically all the leading manufacturers of those parts carry a complete line especially designed to take Covert Transmissions.

Your 1914 plans are now before you. Let us show you the advantages of Covert Construction.

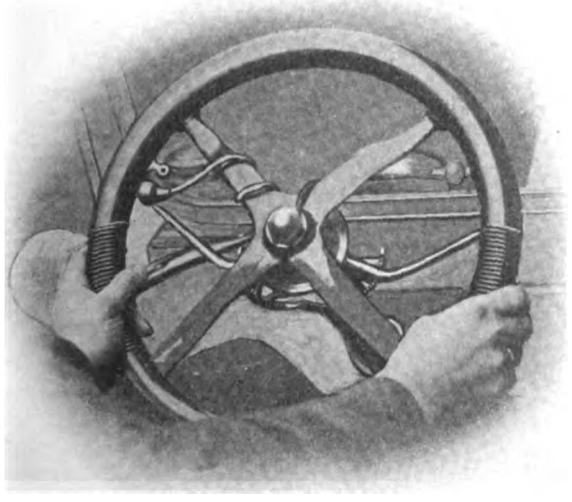
Be a Warm Hand Wheel Dealer

If you are a Warm Hand dealer this season you will be one next season, and every new car you sell or that appears in your territory will mean practically another Warm Hand Wheel sale for you.



The Warm Hand Wheel is as necessary to winter driving as is any other convenience on the car It is not a luxury but a real comfort-giving device useful seven months of the year, and in some sections, even longer.

The Warm Hand Wheel is electrically heated, operating from either storage battery or lighting system, or from the in-built fly wheel magneto on the Ford car.

It consumes a negligible amount of current—can be installed in a remarkably short time—and once on, need never be removed either summer or winter. The reason for this lies in the fact that the current may be turned on or off in an instant by a simple movement of the hand.

Circuit Open

Circuit Closed

No matter how cold the weather, how icy the wind, the Warm Hand Wheel will impart a grateful warmth to the hands, even in cases where gloves are not worn.

This is a simple story. We want you to consider and act upon it—for out of the retail price charged—$15—your commission is most liberal and one well worthy of your consideration.

Write and get your territory before it is invaded.

Warm Hand Steering Wheel Co.

THE LARGEST AUTO SUPPLY HOUSE IN AMERICA

Our Name Is Your Guarantee

WHATEVER you buy from the house of CHAS. E. MILLER you may expect the fullest degree of satisfaction in every detail. Quality, quantity, material, workmanship, durability will be just right or we will make it right. Our name is your guarantee.

To buy from a house the size and standing of this one is the safest way to insure complete satisfaction in all your dealings. We handle goods of **standard quality only** and of course stand back of everything we sell.

No matter what you want in the line of automobile accessories or supplies, remember our slogan, "We Either CARRY IT IN STOCK, WILL GET IT—OR IT ISN'T MADE." One of the prize winners in MOTOR'S recent advertising contest selected this as the slogan out of the many shown. His reason was as follows: "This saying is the clearest possible statement of the Miller business policy which I have found to be a fact through several years of satisfactory relations with them."

Our Annual Catalog is the largest, most complete, up-to-date and authoritative dictionary of the auto supply market of any book published. It has come to be recognized as one of the standard reference works of the industry.

The total distribution of one hundred thousand copies of this catalog practically covers the world, at least wherever automobiles are used. Nearly all foreign as well as domestic automobile manufacturers and dealers, the offices of American Consuls, Public Libraries, Universities, Y. M. C. A. Schools, Publishers, Automobile Clubs, Engineers' Offices, Purchasing Departments—in all these places you will find a copy of the Miller catalog on file.

Fifteen branches spread over the United States, located in the principal motoring centers, bring Miller service within the reach of practically every motorist in the United States. Prompt delivery, perfect quality, honest prices—these are the things that distinguish Miller service and explain the marvelous growth of this pioneer establishment since its inception in 1896.

NINE YEARS' GROWTH

How and Why the Hayes Manufacturing Company Within a Decade Became the Largest Users of Sheet Metal in the World.

FORESEEING the inevitable rise of the automobile industry and the tremendous field offered to the manufacturer of sheet metal parts for motor cars, Mr. J. H. Hayes organized the Hayes Manufacturing Company in Cleveland in 1903.

With 2,000 feet of factory space and a small force of men the first year's business totaled $17,000. Then the small plant was moved to Detroit, reorganized and headed by Mr. Hayes as president, with H. H. Sanger, vice-president, and H. P. Carrow, secretary and treasurer.

Each year the business doubled its sales, expanded its plant and added to its line of products. "Everything in sheet metal for the automobile" became the slogan, and motor car factories all over the country were using Hayes parts.

The factory now has four and one-half acres of floor space, a monthly payroll of $60,000, and did a million and a half business last year. A branch factory has been recently established in Indianapolis to take care of the large trade with that center.

There are more than 20 metal parts used in modern cars, the most important of which is the body. Half of the total volume of business of the Hayes Company consists in building bodies to suit the different requirements of the various makers.

Naturally this highly specialized plant has reduced the working of sheet metal to a science. A long experience has taught efficiency, and economy, and has enabled the Hayes organization to underbid the motor car factories themselves in the making of these parts.

The purchasing power of the Hayes Company, the largest users of sheet metal in the world, is a natural aid in cutting cost.

In connection with this mammoth enterprise is an engineering department of experts who devote nearly all their time to solving the sheet metal problems of the manufacturer. They point out the short cuts and money saving ideas which their long experience dictates, a service many motor car makers have appreciated.

The Hayes Manufacturing Co. deliver their various products in any degree of completion desired. Bodies completely assembled, with fenders, running boards, shrouds, etc., or in separate lots with anti-rust baked on. The tremendous volume of their output guarantees prompt deliveries.

Ask the Hayes organization about your sheet metal problems.

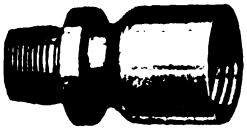
BOSCH PLUGS

As Good as Bosch Magnetos

WHEN a motor car is purchased the source of ignition is generally a Bosch Magneto, but other important units of the system are seldom of equal quality unless the owner insists upon Bosch throughout. This should be done.

The spark plug is one of the most important efficiency factors—it should be carefully selected. In other words, specify Bosch Plugs always. They have been successfully used by the most prominent race drivers of the past season and during that service have proven themselves worthy of your consideration and equipment.

Ask your dealer **$1.00 Each** *or write direct.*



"Locating the Spark Plugs" Tells You More About Them; It's Free.

Complicated work completed without rehandling

The Product
Oil Cup

The Machine
The "Acme Automatic"

Rehandling for extra operations consumes time, increases the cost and ordinarily requires additional machinery.

The Acme Automatic Multiple Spindle Screw Machine works eight or more tools at one time and completes the part in the time of the longest operation or less. On the piece shown forming was the longest operation. All of the other six operations were done at the same time. When the part is cut from the bar it is finished and ready for assembling.

The Acme Way is the most rapid method of producing accurate pieces on one machine. It will simplify the making of your duplicate parts.

Our booklet the "Acme Method" will tell you how. It's yours for the asking.

"Absolutely the Best for the Money"

Is the consensus of opinion as expressed at the New York Commercial Vehicle Show, regarding the

Selden Truck

$2000

The sturdy powerful construction of the Selden Truck, its extreme simplicity and its marvelous value instantly won the admiration of discriminating buyers, and made it the most talked of car at the show.

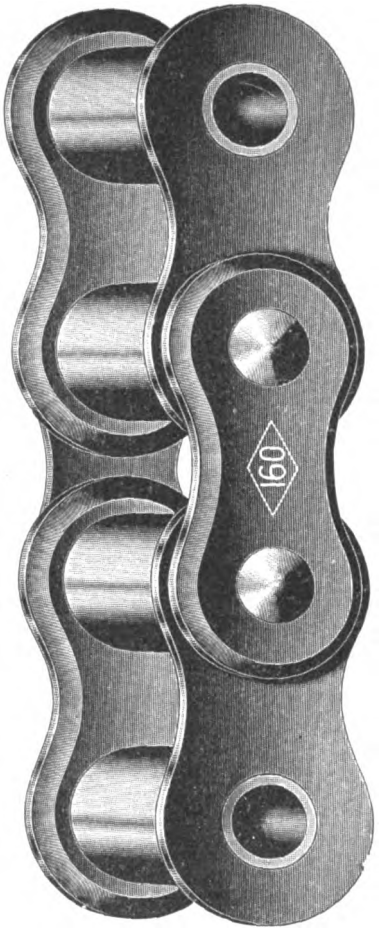
The Selden was compared with trucks of greater capacity and higher price, and was conspicuously ahead of anything in its class.

Sold on Time-Payment Plan

We offer the Selden Truck, direct or through our agents for $500 down and the balance in 12 monthly payments of $125 each.

This plan makes possible five sales to one on a cash basis.

AGENTS, THINK OF THAT



Territory is being rapidly assigned. We want only live, responsible dealers anywhere. From two to five dealers have applied for some of the territory now under contract, so great has been the demand for the Selden. Better write today, giving sales and service facilities.

We will Exhibit at the Chicago Show Feb. 10-15, Coliseum, Section A

SELDEN TRUCK SALES CO.

182 East Avenue, ROCHESTER, N. Y.

A prominent automobile manufacturer says:

"We have used Diamond Chains for years. We are pioneers of solid tired vehicles and Diamond Chains have pleased our customers. I do not hesitate to tell you that they are our sole stand-bys."

This is what the sales manager of a large automobile manufacturer wrote an interested engineer on the above subject.

Twenty-two years of progressive development and constant supremacy in the manufacture of machined chains enable us to offer to Diamond Chain users a chain of long life and absolute reliability.

Diamond Chains must test up to a fixed high standard before leaving our factory, and this test invariably involves a duty greater than that for which the chains are designed and sold. Our engineering department will advise freely on design problems. Write for our treatise "Power Chains and Sprockets."

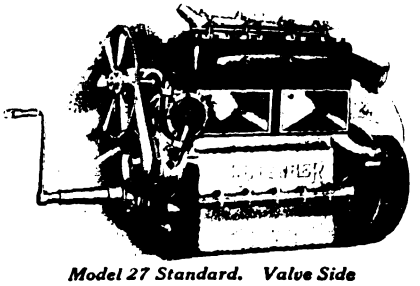
To Catch the "Limited"

Speed regulations have little weight with the driver of the mail wagon or with the expressman. Yet horses still serve in these important branches because dependability is even more essential than speed.

Few cars are so perfect that they can be counted on to give uniform and unfailing service at the critical moment. But the car that carries

THE RUTENBER MOTOR



is always in commission. It goes when and where it is needed. It catches the train and delivers the goods. There are less chances of delay with a Rutenber-driven truck than with a horse-drawn wagon. There is no noise, no confusion, no uncertainty. No time is lost because of uneven streets or steep hills. And there are no big bills for upkeep and repairs.

If you are interested in motor service of this character it will pay you to investigate the Rutenber Motor.

Write for catalog.

Sell This King of Electric-Car Tires

Approximately **one-half** of all the Pleasure Electrics in America are **Motz-equipped.** The other half is divided among a score of tire makers.

Thus has the public plainly shown preference for Motz Cushion Tires, a fact which alert dealers are taking advantage of.

If you, Mr. Dealer, have **Electric** tire customers, by all means write us for prices and terms.

A—Double, notched treads.
B—Undercut Sides.
C—Slantwise Bridges.
D—Shows how tire absorbs shocks.

The Motz Cushion Tire

is as easy riding as a pneumatic, except under excessive speed. It never punctures. No blowouts. No dangerous skidding. No repair expense. Ten thousand miles guaranty (2 years on electric cars).

Its amazing resiliency is due (1) to its double, notched treads, undercut sides and slant-wise bridges, (2) to a quality of rubber costing 50% more than the ordinary, (3) to 50% more pounds of rubber than in tires of equal carrying capacity.

Send today for Booklet 58 and Agent's prices.

STUTZ

The Stutz Is Quality Built

Every STUTZ car is built with as much care and pains as the costliest watch. Every ounce of material—every detail of workmanship that goes into the STUTZ is absolutely the best.

There are so many satisfied STUTZ owners throughout the country that we are not spending a nickel for national magazine advertising—we have demands for more cars than we can produce under our careful, painstaking system without it. We are putting that cost into STUTZ QUALITY.

We are building less than 1,000 cars—we have demands for three times that many.

If we built more cars we could not give the attention to the many details—such as are easily slighted in a great organization burdened with quantity production.

We could not build in quantities without sacrificing the QUALITY—and we would not sacrifice the QUALITY of one STUTZ car for the greatest quantity production in the industry. We would far rather be known as QUALITY producers.

STUTZ MODELS

STUTZ cars are made in five models.
Six-cylinder, six-passenger touring car, $2300.
Six-cylinder roadster, $2250.
Four-cylinder, six-passenger touring car, $2050.
Four-cylinder, four-passenger touring car, $2000.

The Motor Lamps with Distinctive Features

There are no other motor lamps on the market with the advantages of Solar Lamps. Solars are always exclusive in style and in quality. They are the strongest lamps as well as the most effective.

In no other lamps can you obtain the Solar Special Short Focus Lead Glass Lens Mirror Reflector—the patented system of double ray light projection which gives two distinct fields of light for town and country use—or the new and exclusive black finish with a metallic lustre which is unaffected by heat or moisture. All of these features are exclusively "Solar."

Do not equip your car or specify equipment to the maker until you have seen all of the Solar advantages. See Solars at any live dealer's or write for the catalog.

Solars are made in all styles for oil, electricity, gas and in combinations.

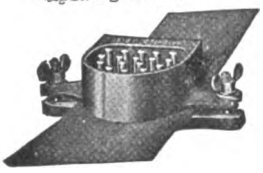
We also make Duplex and Raymond Brakes and Gyrex the Mixer.

Repairing Casing

TIRE CUTS ruin casings. They admit moisture to the carcass, cause the fabric to rot and weaken, grow larger—end in blowouts.



You can repair **CASINGS** and **INNER TUBES** anywhere in 15 minutes, better than a Repair Shop can do—and for *one cent*.

Universal Auto-Vulcanizer

Patented

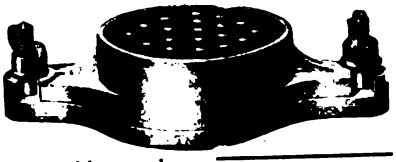
A practical vulcanizing outfit complete, with enough repair gum to make 40 patches. It weighs 3 pounds and can be carried in the tool box. **Simplest and most satisfactory device for eliminating tire troubles that has ever been devised.**

Absolutely automatic. Place the patch—attach the Vulcanizer—put in the gasoline light it. No further attention required. In 15 minutes the job is done.

It *can't burn, scorch* or *injure* tube or casing. It *can't* get out of order. It *can't* fail to do its work. So simple, anyone can operate it. The Universal Auto-Vulcanizer saves its cost a *hundred times* over in trouble and expense.

Price Complete, **$4.00** Ready for Instant Use

Guaranteed Satisfactory or Money Refunded



ADAMSON MFG. COMPANY, East Palestine, Ohio

Repair That Inner Tube Yourself

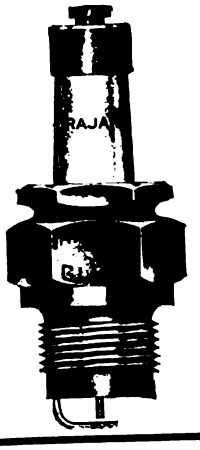
No electricity, no steam, no trouble, no delay. A little gasoline, a little rubber, the

Imperial Vulcanizer Repair Kit

and a few simple directions, and you have repaired the puncture perfectly in 15 minutes. Time and money saved.

GUARANTEED TO SATISFY OR MONEY REFUNDED

PRICE, $3.50



NICKEL PLATED

Patent Pending

Complete with enough rubber for 40 punctures. Pays for itself in a short time.

Weed Chains

The Great Anti-Skid DEVICE

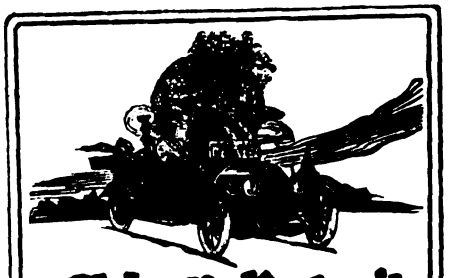
Nine-tenths of all accidents to automobiles are caused by skidding or slipping.

Either you skid into the "other fellow" or the "other fellow" skids into you.

No matter how careful a driver you may be, you cannot prevent skidding or slipping on wet, muddy snow-covered roads or on icy, slippery greasy pavements unless you equip your car with Weed Chains.

Cannot Injure Tires

Because They Creep



An absolute necessity on both rear wheels and if you want to know what real steering steadiness means put them on the front wheels too.

For your own safety—for the safety of the public, fully equip your car with Weed Chains. Make it your business to get a set today.

The Name "Weed" on Every Hook

Recommended and sold by all reputable dealers

Complete Vulcanizing Plant $45

A great money maker for the garage or repair shop. Handles every practicable kind of tire repairing, from a tube puncture to largest casing blow-out.

No experience necessary for its successful operation as the steam pressure is automatically controlled and held at the vulcanizing point. Steam generated in a copper coil boiler that heats the machine as quickly as you can get a tire ready.

Place your order at once and insure delivery of your vulcanizer when you want it. Be prepared to handle the most profitable part of the repair business.

SHALER

Vulcanizers for Every Requirement of Motorist or Repairman

Electric DISCO Starter

Astounds New York Show Visitors

Interest at the New York Show was largely centered around **Electric Starters** and, naturally, motorists expected to see some good demonstrations, but imagine the exclamations of surprise and astonishment created by the following exhibition:

Every ten seconds, night and day, the Electric Disco by pressing a button was made to S-P-I-N a great big 60 H.P. Six Cylinder Engine, under 65 pounds compression, ONE HUNDRED AND TWENTY Revolutions Per Minute!

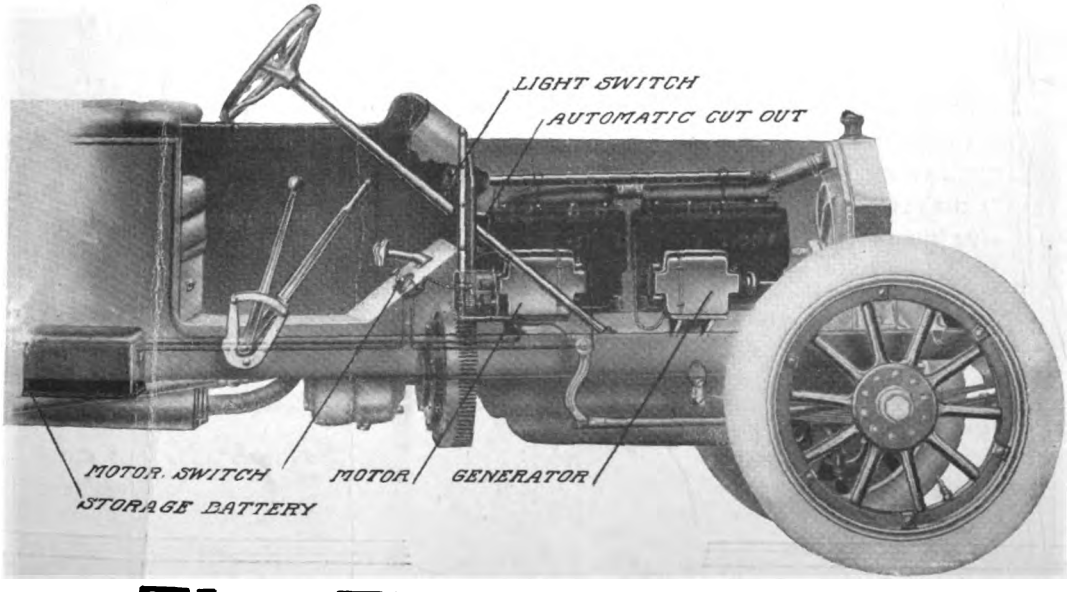
Think how **fast** that is!

Think how **large** a 60 H.P. Continental Engine is!

Think what **65 pounds** compression means!

It just means that here is an Electric Starter that takes the **biggest engine** under **full compression**, and makes it fairly **hum**. Doesn't merely **turn** over the engine or **crank** it but SPINS it—almost like a toy top.

What more could men ask of a Starter?



* * * * *

Don't make the mistake of buying a car with "any old" electric starter. **Investigate.** Write for literature on all the Electric Starters you know. Learn all the facts. **See for yourself. Then** judge.

And remember **this**, the **best** Electric Starter, even though it may cost more than others, **is none too good for YOUR CAR.**

Don't you want our new Book, our Story on Starters, just off the press? It's a handsome little 5 x 7 Brochure that portrays in type and picture the latest developments in **Electric Starting** and **Lighting.** You may have a copy sent to your home or office. Just drop us a line and we'll forward it by return mail.

Flexible springs and deep upholstery do not give you the maximum motoring comfort. It is these things in combination with the

Truffault-Hartford SHOCK ABSORBER

that realize easy riding on all roads, rough or smooth. TRUFFAULT-HARTFORDS assimilate all jolts and jars—and by eliminating vibration, reduce the danger of crystallization of axles and steering knuckles. Their value as tire savers makes them an economy. In a season they will save many times their cost in increased tire mileage obtained. Most efficient and least conspicuous of all shock absorbers. The choice of discriminating motorists and of 23 leading car manufacturers for regular equipment. Five models, the New Automatic $60, Standard $50, Intermediate $40, Junior $25, Juniorette $15 per set of four. See your dealer and write for our catalog.

Bearings of Recognized Worth are Ear Marks of Car Quality

DEALERS

Are the Cars You Represent R.I.V. Equipped?

The reason for the adoption of R. I. V. Ball Bearings is that car builders know they are right for the service they have to perform.

In speedway races, in road work, in touring, in commercial car work, the R. I. V. have made records never before equaled.

They have the greatest resistance to wear under weight and load, end thrust which comes when rounding corners, and shocks from bumps and ruts.

The prominent manufacturers are equipping their 1913 cars with R. I. V.

The Atwater Kent Ignition System

Time was when automobile engineers and the general motoring public thought they must equip their cars with a magneto. Today this idea is fast waning—in fact, it has been discarded by many of the foremost automobile engineers and discriminating motorists who are now demanding a more dependable source of current on their cars.

The increasing use of electric lighting and starting equipment necessitates an ignition system better than the magneto—a system producing a uniformly hot spark at low speeds as well as high—a system giving a hot starting spark with the motor at a standstill—a system that is simple in principle and mechanism as well as in operation, and reasonable in initial and maintenance cost—in brief, a system of ignition that will measure up to the highest requirements of the most modern automobile practice.

Such is the Atwater Kent Ignition System—embodying the best features of both magneto and battery, without the weaknesses of either.

Remember the Atwater Kent System can be easily and quickly installed on any standard make of motor, new or old, without the price of a magneto.

If you have an unsatisfactory magneto, or if your motor is not equipped with a half time shaft, you can use the Atwater Kent System by means of our magneto gear mounting, the cost of which is nominal.

In addition to our standard Type F System, we are marketing a new model —Silent Type K with automatic spark control and insulated primary circuit.

Whether you are interested in motor cars as manufacturer, dealer, owner, or prospective buyer, you should have a copy of our booklet "D." It covers the subject authoritatively and thoroughly and even the most experienced will find it interesting reading.

MONOGRAM OIL

¶ In the production of our automobile oil — MONOGRAM—only 4½ gallons of it, or 4½ per cent, is obtained from every lot of 100 gallons of Pennsylvania crude.

¶ This 4½ gallons or 4½ per cent, is the very marrow of the crude with all its remarkable wearing and lubricating qualities and the other 95½ gallons or 95½ per cent, can only be used for such by-products as gasolene, kerosene, ordinary engine and machine oils, and black oils.

¶ This is one reason why MONOGRAM OIL has been continually successful under that one brand name from the very start of the automobile industry.

The FEPS CARBURETOR

"A GIANT IN POWER — A MISER IN FUEL"

and our splendid Dealers' Proposition

THE carburetor has been the one weak link in the chain of motor car efficiency. As a thoroughly experienced dealer, you cannot deny this fact. Now comes the FEPS to complete and perfect that chain beyond even your most cherished hopes.

The FEPS involves an entirely new principle of auxiliary air supply, producing a marvelous increase in flexibility; an absolutely perfect mixture at all speeds with an increase of 25 to 50 per cent in miles per gallon of fuel on *any* car.

It contains no springs, no balls, no cams, no reeds, and all adjustments once made are permanent. It gives a perfect mixture with any grade of gasoline and is unaffected by altitude, weather conditions or change of temperature. It also embodies a never failing quick starting device.

Line up with the FEPS now. Be in a position to really perfect the efficiency of any car that comes to you. Our proposition is very attractive for increased business and profits for *you*.

Vol. XXXIV New York, U. S. A., Thursday, February 13, 1913 No. 8

N.A.A.M. TAKES COGNIZANCE OF GASOLENE SITUATION

Appoints Committee Which Seeks to Discover "What's What"—Engineers' Society Also to Discuss Kerosene Carburetters.

Although no announcement of the fact was made, it transpires that the National Association of Automobile Manufacturers has interested itself in what has come to be known as the "gasolene situation." Its interest has taken the form of the appointment of a committee of three to probe the subject, the committee consisting of Alfred Reeves, chairman, A. L. Pope, of the Pope Mfg. Co., and R. D. Chapin, of the Hudson Motor Car Co. The committee is clothed with general authority to go as far as possible in its investigations, the result of which, of course, will be reported to the association.

It is known that the committee has interviewed at least two of the influential directors of the Standard Oil Co., and before it completes its labors it expects to confer with others and also with representatives of the several independent companies, and, in fact, to seek information wherever it is likely to be found.

The chief idea of the N. A. A. M. inquiry is not so much to discover the causes that have led to the 90 per cent. advance in the price of the fuel within about a twelvemonth, but to find out what is the prospective supply for not merely the forthcoming year but for a period of at least five years and, of equal importance, what is likely to be the quality or specific gravity of the fuel; also what suggestions or recommendations the oil producers themselves have to make which point to at least a measure of relief.

When the information is obtained, and if it is learned that the supply of gasolene is likely to diminish and increase in price, and that kerosene or some other fuel is necessary to save the situation, it is the intention of the N. A. A. M. to call the engineers of various automobile companies in conference and have them redesign their motors or carburetters, or both, to meet the new conditions.

Less directly, the Society of Automobile Engineers also is interested in the subject of gasolene. At the next meeting of the Metropolitan Section of the society, which is scheduled for Feb. 27th, and will be held in the society's rooms at 1784 Broadway, New York City, a paper on kerosene carburetters for motor car use will be presented, and invitation has been extended to all carburetter manufacturers to be present and take part in the discussion, which is expected to prove unusually fruitful.

Goodyear Buys Control of Fabric Mill.

Interests representing the Goodyear Tire & Rubber Co., of Akron, Ohio, have purchased the controlling interest in the Killingly Mfg. Co. of Williamsville, Conn., which manufactures tire fabrics among other cotton goods. Following the acquirement, new offices for the Killingly company were elected, as follows: President, Benjamin F. Smith, of the B. F. Smith Construction Co. of Pawtucket, R. I.; treasurer, W. E. Palmer of Akron, Ohio; vice-president and assistant treasurer, W. Irving Bullard of Danielson. These gentlemen and W. T. Teegan of Boston and A. M. Bannister of Providence make up the new board of directors.

Million Dollar Tire Company on Coast.

W. D. Newerf, who for many years was prominently engaged in the tire jobbing business on the Pacific Coast and who latterly has been occupied in organizing a company actually to manufacture tires in that territory, has matured his plans to the point of incorporating the Panama Rubber Co., capitalized at $1,000,000. It is stated that he has interested a number of Los Angeles and San Francisco men in the enterprise and that a factory site near San Francisco is being considered.

CONSOLIDATED SEEKS TO SEIZE GOODRICH STOCK

Near-Expiration of Grant Solid Tire Patent Creates Remarkable Situation—Goodrich Accused of Holding Back Tires.

Although the famous and much-litigated Grant imbedded-wire, solid-tire patent, No. 554,675, owned by the Consolidated Rubber Tire Co., expires next Tuesday, 18th inst., a flood of tires of that construction upon the market will not immediately follow if the United States District Court for the Southern District of New York grants a motion which has been made by the Consolidated company and which is due for argument on Friday of next week, 21st inst.; the motion, among other things, will ask that some 300,000 pounds of tires, alleged to be held in stock by the new B. F. Goodrich Co. at its factories, be seized and held for an accounting on the grounds that the tires were manufactured prior to the expiration of the patent, which has been held valid by the courts. These tires are said to be worth about $120,000, and if the makers contemplated placing them upon the market as soon as the patent dies the granting of the motion will cause them some inconvenience.

This motion is a part of the Consolidated's suit against the Diamond Rubber Co. of New York which was filed in 1907 and is a part of litigation that has filled the volumes in the United States District, Circuit and Supreme courts for nearly fifteen years. The immediate status of affairs may be briefly explained by the statement that the Consolidated's suit against the New York Diamond company resulted in a victory for the former in every court and the action now has been in the accounting stage for about a year, which is to say that the machinery of the courts is being used to determine how much the Diamond owes the Consolidated because of manufacture and

Digitized by Google

sale of infringing tires prior to the injunction which stopped sales.

Since the Goodrich company bought the Diamond company, and with it the New York Diamond company, the motion will also ask that the new and larger Goodrich company, B. G. Work, its president; Arthur H. Marks, president of the old Diamond company; William B. Miller, former Diamond secretary, and Andrew H. Noah, vice-president of the old Diamond company, be made parties in the defense. The motion was to have been made last Friday, 7th inst., but was adjourned for a period of two weeks.

The Consolidated, which is now known as the Kelly-Springfield Tire Co., won its infringement suits all along the line, and of the defendants the Hartford, Morgan & Wright and Firestone companies have made settlement. In the accounting stage are judgments against the Pennsylvania Rubber Co., the Thermoid Rubber Co. and the Rutherford Rubber Co.

An additional new feature in the litigation consists of two decisions in favor of the Consolidated interests rendered in the United States Circuit Court of Appeals in Chicago last Friday, 7th inst. Despite the many previous decisions in favor of the Grant patent, Judge Kohlsaat, of the District Court, had thrown both cases out of court as devoid of equity and the Appellate Court as promptly overthrew these decisions from the bench, ordering a mandate down to the lower court immediately, whereas the usual order is to permit thirty days to elapse, granted an injunction and ordered an accounting for the Consolidated. The defendants in these two actions were the B. F. Goodrich Co., of Akron, Ohio, and the Republic Rubber Co. of Youngstown, Ohio.

Engine Starters Cause of $3,100 Suit.

When the Pullman Motor Car Co., of York, Pa., files its answer to the suit which was instituted this week in the Supreme Court for New York County by the American Ever Ready Co., it may tell why it refused to pay for Ever Ready starters to the value of $3,103.24, but this far only the Ever Ready side of the argument is public property. The complaint states that the Pullman company contracted for engine starters and was to pay $50 each for No. 2's and $55 for No. 3's, and that between April 25 and December 19, 1912, goods to the amount of the judgment asked were purchased. The contract specified that the starters were to be regular equipment on all Pullman models except the 4-30, 4-35 and 4-50, these latter being excepted because, it states, they are to be discontinued as soon as the material on hand for their manufacture is exhausted.

1912 IS 48% BETTER THAN 1911 IN EXPORTS OF CARS

Automobiles Valued at Close to $24,000,000 Shipped in Twelvemonth Just Ended—Gains Recorded in Other Years.

Keeping pace with the records of preceding years, 1912 in the matter of automobile exports marked a substantial gain over 1911, the shipments for the calendar year just closed totaling $23,703,989, which is $7,779,628, or 48 per cent., in advance of the 1911 figure. The statistics do not include tires, parts or engines and the values of cars shipped to the non-contiguous American possessions, Hawaii, Porto Rico, the Philippines and Alaska are omitted, those compilations not yet having been completed. In 1911 the car exports were supplemented by the addition of $3,254,123 for parts, not including tires.

The gain of December, 1912, over the same month of the preceding year was slight, being but $127,382, or .66 per cent. The comparative values were, respectively, $2,060,812 and $1,933,430.

While the gain of 1912 over 1911 exceeds that of 1911 over 1910, neither is as great as the advance made by 1910 over 1909. The 1910 exports of cars totaled $11,210,295, which 1911 surpassed by $4,713,066, a gain of 42 per cent. The advance of exports in 1910 over the twelvemonth which went before was 62 per cent. The 1910 figures, as stated, were $11,210,295, which, in comparison with $6,889,031, the 1909 valuation, is a monetary increase of $4,321,264. The parts exported prior to 1911 were: 1910, $1,980,001; 1909, $897,586.

Prest-O-Lite Presses Refilling Suits.

When the Municipal Court of New York City held last week that the Prest-O-Lite Co. could not legally sue the 35% Automobile Supply Co., of New York City, for a penalty of $100 for refilling trademarked Prest-O-Lite tanks because of a defect in the filing of the trademark in New York State, that case was abandoned by the complainant, but the trademark was immediately refiled so that it accorded with the law as amended in 1907 and other suits are to be pressed. The decision in the "35%" case was more or less technical. Those who are still to be prosecuted are Smith-Haines, Inc., the Automobile Supply Co. and the Economical Tire & Supply Co., all of New York City. The cases probably will be heard February 21.

While the Searchlight Gas Co., just prior to going into the hands of a receiver, succeeded in overturning the patent under which the Prest-O-Lite Co. operated, litigation between the two is not ended, for there yet remains an action against the Searchlight in the United States District Court in Indianapolis in which the Searchlight is charged with unfair competition in refilling Prest-O-Lite tanks. This is under a Federal trademark law.

Mason Sues its General Manager.

H. W. Hayden, vice-president and general manager of the Mason Motor Co. of Waterloo, Ia., has been made the defendant in an action instituted by the company, which charges conversion and misappropriation of funds to the amount of $18,000. The complaint asks judgment for that sum and prays that a lien be placed upon certain stock of the company held by Hayden.

According to the papers in the case, Hayden became a Mason stockholder in September, 1911, when he acquired 1,888 5/6 shares, each of $100 par value. In January of the following year he was made a director of the company and assumed the vice-presidency and general management. Between September, 1911, and January 25, 1913, according to the complaint, Hayden had charge of the financial affairs of the company, making collections, receiving moneys, drawing checks, etc., and it was during this period that it is alleged he converted to his own use, or otherwise misappropriated, funds to the amount of $18,000.

Miller Sells Out to His Partners.

A. R. Miller has disposed of his interest in the firm Barthel, Daly & Miller, of New York, to his partners, the firm name becoming Barthel & Daly. They will continue to act as sole American importers of Schafer ball bearings. Miller, however, will not wholly discontinue his association with his former partners, as he will continue to represent the firm in the West. For some time he has been stationed in Detroit, which will remain his headquarters.

Packard Markets Remaining Note Issue.

Wm. A. Read & Co., the New York bankers, have purchased from the Packard Motor Car Co. the $1,000,000 five per cent. debenture five-year notes which constitute the unsold balance of the $3,000,000 issue which was authorized in December, 1911. The bankers at once resold the entire block. The notes are redeemable at 101 on any interest day.

Batcheller Would Become "Akron."

The Batcheller Rubber Mfg. Co., of New York City, has applied to the supreme court for permission to change its name to the Akron Tire Co., Inc. In the proceedings Margaret M. Burnet, of 2 Rector street, figures as the Batcheller attorney.

FORD ASKS COURT TO HOLD UP EXPORTER'S SHIPMENT

Declares Bowring Company Would Invade Territory of Ford's New Zealand Dealer—Cars Were Intended for Chili.

New Zealand, Chili, thirteen Ford Model Ts and the steamship "Minnehaha" figure in an action which was instituted this week in the Supreme Court for New York county by the Ford Motor Co. against Bowring & Co., New York exporters, and the Atlantic Transport Co., which owns the ship in question. The Ford company asks that the steamship company and Bowring be restrained from shipping the cars outside of New York while the case is pending in court, and the urgency of action at the present time is indicated by the statement that the thirteen Model Ts in question are aboard ship all ready to start for New Zealand.

The Ford claim is that it is making a strenuous effort to protect its New Zealand dealer, its policy being not to permit anyone else to ship Fords into a dealer's territory. Despite the fact, it claims that Bowring & Co., apparently having found Ford customers of their own in New Zealand, sought for cars to fill the orders and, not being able to secure them from the Ford company, managed to get them from the Ford company's Chili dealer, so that instead of the cars being on their way to Chili, as the Ford company supposed, it learned at the last minute that the original "L. A. C. Valparaiso" shipping mark had been rubbed off the cases and "S. I. A. Dunedin" substituted. Dunedin is a New Zealand port.

The injunction is asked especially against the captain of the Minnehaha, who is the man at present in charge of the cars in their place aboard ship at the docks in New York City. The request also is that Bowring & Co. be restrained from delivering the cars to any of their agents or representatives in New Zealand or anywhere else.

Taft-Pierce Sues Mitchell-Lewis.

Just why the Mitchell-Lewis Motor Car Co., of Racine, Wis., broke a contract it made February 29, 1912, with the Taft-Pierce Mfg. Co., of Woonsocket, R. I., whereby the latter was to build jigs, tools and other equipment for the production of 1913 Mitchell cars, is not stated in the complaint which the Woonsocket company has filed in the New York City Court against the automobile manufacturing company, but the tool producers claim the breach was unwarranted and demand damages of $434.79.

The Taft-Pierce company claims the contract was cancelled March 8, 1912, and that up to that time it had expended $198.38 in materials and labor; $236.41 is asked for the expenses and services of two men who were engaged to go to the factory in Racine to prescribe and make rough drafts of tools and jigs but who were held in Collingswood, Ohio, by the wreck of the 20th Century Limited the night of March 6, 1912. When the Woonsocket company offered to rush two other men to Racine, it claims, the offer was refused. An attachment, which was secured when the claim was filed, was vacated last week, when the Mitchell company filed a bond.

Knox Formally Declared a Bankrupt.

Growing out of the petition filed on January 20th last by three minor creditors, the Knox Automobile Co. of Springfield, Mass., was formally adjudicated a bankrupt on Monday, 10th inst. A meeting of the creditors will be held on either February 21st or 28th, at which trustees will be chosen and at which time it is believed arrangements will be effected that will permit of the projected reorganization, of which the bankruptcy proceedings constitute but the first step.

Nyberg Denies Report from Tennessee.

Despite press reports from Chattanooga, Tenn., that he had disposed of his interests in the branch factory which he established in that city last year, Henry Nyberg, of the Nyberg Automobile Works of Anderson, Ind., denies that he has done anything of the sort. The newspaper reports had it that Nyberg had sold his Chattanooga holdings to local capitalists whose purpose it was to enlarge the plant and devote it entirely to the production of six-cylinder cars.

French Tire Seeks American Favor.

The Etablissements Bergouguan of Clermont-Ferrand, France, which manufactures the Gaulois tire and which claims to be the second largest tire manufacturing company in the world, is preparing to make a bid for the American trade, having established a branch in New York City. It is in charge of Jean Grenier, who was in charge of the Montreal branch which the Gaulois people maintained for several years.

Saunders Forms a British Company.

Leslie R. Saunders, the American inventor of the gasolene saving device which bears his name, has registered the Leslie R. Saunders & Co., Ltd., under the laws of Great Britain. Its authorized capital is $20,000 in $5 shares. No. 106 Charing Cross Road, London, is named as its principal office. Its directors are Saunders himself, E. D. Stead and S. A. Cairns.

COURT DECLARES INVENTION LACKING IN SAGER BUMPER

Rochester Company Loses Suit When Grossman and Auto Bumper Appeal—Lower Court Favored Sager, But Unwillingly.

Hopes which were raised for the United States Auto Bumper Co., of Chicago, and the Emil Grossman Co. of New York City, when Judge Hough in the United States District Court for the Southern District of New York, on May 3, 1912, declared himself compelled by precedent but nevertheless unwilling to decide against the Grossman company and its backer, the Auto Bumper company, in a patent infringement action brought by the J. H. Sager Co., of Rochester, N. Y., were realized Tuesday, 11th inst., when the United States Circuit Court of Appeals for the Second Circuit, sitting in New York City, reversed the judgment and decided against the Sager company.

The action was brought by the Sager company for alleged infringement of patent No. 885,181, granted to James H. Sager, April 21, 1908, and covering what is known as the Sager bumper; the Grossman company was marketing a bumper manufactured by the United States Auto Bumper Co. under the McGregor patent, No. 958,420, and therefore this latter concern assumed the expense of the litigation. Judge Hough in his decision last May, upholding the Sager patent, said that ascribing the dignity of invention to the device was repugnant to him but that he felt called upon to rule as he did because of precedent, part of which was based upon a decision by Judge Kohlsaat of Chicago.

The Appellate Court in commenting upon the device, whose object is to provide a spring shock deadener at the front of the car, stated that "generally speaking, this idea was old as mechanics and it was also old as applied to motor cars." The decision follows:

"Prior to Sager's application, a patent was issued to R. W. Harroun, December 10, 1907, for an 'automobile bumper' designed to accomplish the identical purpose which Sager had in view, viz., 'to protect the automobile parts thereon from damage by collision.' The Harroun bumper is mounted on the car 'by means of spring connection so as to absorb any shocks caused by a collision' and acts 'as a cushion when it is bumped against an object.' The only difference between the Harroun device and that of the patent in suit is that in the former the spring is compressed by direct action and in the latter the interposition of a lever causes the bumper to rise slightly and com-

Digitized by Google

press the spring in a downward direction.

"A patent was granted to Edgar Thomas July 31, 1894, for a car fender designed especially for electric and cable street railway cars. The specification says: 'When the object is struck by the movable member of the fender, the force of the blow is greatly diminished by the fact that the said member is movable and also by reason of the cushioning effect of the springs or like yielding medium, so that the liability of serious injury to a person by being struck by the fender is reduced to a minimum.' It cannot be denied that if the Thomas device were inverted and applied to the front of a motor car it would produce the same result, including the rising of the buffer, as is produced by the Sager device.

"The record contains other patents having the same general purpose in view, but it is unnecessary to refer to them, as they add nothing of importance to the art as disclosed by the two patents above mentioned. We have, then, in the prior art a spring buffer bar designed to protect the lamps and front portion of the automobile and to accomplish precisely the same result as Sager. The only difference being that in Sager there is a lever arm which causes the bar to rise when it meets with an obstacle, while in the Harroun structure there is simply a spring which is pushed back on a horizontal plane, the buffer bar not rising.

"We also have in the prior art a street car fender which, if inverted and applied to an automobile, will accomplish the same result pointed out in the Sager patent. We cannot think that it involved invention, in view of the prior art as thus disclosed, to produce the buffer bar of the patent. The only change which differentiates the Sager buffer from the Harroun buffer is the introduction of the lever which causes the bar to rise slightly when it strikes an obstacle instead of being forced directly back. As this principle was well known in mechanics and is shown specifically in the Thomas patent, we think its application to an automobile, assuming it to be an improvement, was the work of a mechanic and not of an inventor.

"The District Judge relied largely, in reaching his conclusion, upon the decision in the case of Turner Brass Works vs. Appliance Manufacturing Co. in the Northern District of Illinois, the patent in issue being the patent to Harroun above referred to. We do not know what the record disclosed in that case. The only patent mentioned in the opinion is the patent to Simmns, which was held to be unavailable. We are not at all satisfied that the decision would have been as it was if the patents before this court had been in evidence. However this may be, the question here is, Did it involve invention to make the Sager buffer, in view of the prior art in the Illinois case, plus the Thomas street car fender patent and the Harroun patent itself? For the reasons already stated we think it did not.

"The decree is reversed with costs."

Peerless Issues Five-Year Statement.

Following its recent increase of capital to $10,000,000 and its semi-reorganization, the Peerless Motor Car Co. of Cleveland, Ohio, has made public a financial statement covering the five years from December 1, 1907, to December 1, 1912. It shows total sales of $22,817,295, on which the net earnings amounted to $4,070,026, which, after deducting $637,328 for depreciation and $271,211 for other purposes, leaves a net profit of $3,161,486.

The balance sheet as of November 30, 1912, shows assets as follows: Cash, $447,671; accounts and notes receivable, $298,869; prepaid interest and insurance, $35,476; plant accounts and invested, $3,664,273; inventory, etc., $2,323,435.

Liabilities — Accounts payable, $189,436; accrued interest, taxes, etc., $129,220; capital stock, $4,200,000; bonds, $1,100,000; reserve fund, $126,500; surplus, $1,024,561.

May Cut White Judgment in Half.

Because the Court of Appeals of New York State has ruled that the New York City Court acted beyond its rights in handling cases wherein the amount involved was in excess of $2,000, the Appellate Term of the Supreme Court for New York county ruled this week that a judgment for $4,422.70 secured by the White Co., of Cleveland, Ohio, against its former Brooklyn dealer, the White Motor Car Co., and Philip S. Saitta, a New York City attorney, cannot stand. The decision was to the effect that the defendant would be granted a new trial unless the complainant consented that the judgment be reduced to $2,000, the City Court's limit. The matter has not finally been settled. The suit was on notes which the Brooklyn White company gave when it contracted as dealer, the paper being endorsed by Saitta.

U. S. Motor Completes Reorganization.

As the formal successor of the United States Motor Co., the Maxwell Motor Co. has completed its organization by the election of the following directors: James C Brady, Harry Bronner, Eugene Meyer, Jr., Henry Sanderson, William E. Potter, Geo. H. Burr, W. Catchings, Wm. J. Maloney, Walter E. Flanders and W. F. McGuire. The directors, in turn, elected Flanders president, McGuire vice-president, W. B. Anthony comptroller and Carl Tucker treasurer, in accordance with previous announcements. Brady and Eugene Meyer, Jr., were members of the United States Motor Co.'s directorate and were insistently active in its affairs. The appearance of Henry Sanderson, one-time president of the Automobile Club of America, as one of the directors contains the only element of even mild surprise in connection with the formal organization.

Canadian Company in Masonic Temple.

The Royal Motor Car Co., which recently was organized in London, Ont., with an authorized capital of $500,000, has established temporary offices in the Masonic Temple building in that city. The factory site has not yet been chosen, but it is the intention to manufacture a five-passenger touring car, styled the "Royal 30," which will sell for about $1,600. The officers of the company are: D. J. Cowan, president; C. C. Wright, vice-president; D. W. Henry, secretary; R. C. Eckert, treasurer; F. G. Mitchell, managing director.

Superior Absorbs Knickerbocker Brass.

The Superior Lamp Mfg. Co., which manufactures Superior lamps and electric horns, has taken over the business of the Knickerbocker Brass Goods Co. at 124th street and First avenue, New York. Henry Futterman is president of the Superior company. He also is interested in the New York Coast and Auto Lamp Co. A. L. Futterman, previously identified with the Knickerbocker Brass Goods Co., is vice-president of the Superior company.

Fire Destroys Double Fabric Plant.

Fire on Saturday night last, 8th inst., destroyed the W. H. McIntyre building in Auburn, Ind., which was occupied by the Double Fabric Tire Co. and the W. H. McIntyre Co.'s retail salesroom. The tire company's equipment was completely ruined and 10 McIntyre automobiles and a large number of buggies were destroyed.

Hermes Acquires Cincinnati Factory.

The Hermes Motor Co., which was organized in Cincinnati, Ohio, several months since, and of which Albert Kleyboldt is president, has acquired a factory on Bluerock street, near Hamilton avenue, in which the first Hermes car is nearing completion. It is a six-cylinder, 50-horsepower model, having a wheelbase of 124 inches.

Cole Denies Contemplating Removal.

Reports, printed in Detroit, that the Cole Motor Car Co. contemplated removal to that city from Indianapolis are emphatically denied by the Cole officials; they say there is absolutely no truth in the story.

The Hill-Standard Mfg. Co. of Anderson, Ind., is about to engage in the manufacture of wire wheels.

The Week's Incorporations

Los Angeles, Cal.—Acme Electric Auto Works, under California laws; authorized capital, $10,000; to operate a garage for electric cars.

Melrose, Mass.—Auto Adjunct Co., under Massachusetts laws; authorized capital, $50,000; to deal in motor cars and supplies. Corporators—J. E. Knapp and others.

Chicago, Ill.—Feldt Motor Co., under Illinois laws; authorized capital, $1,000; to deal in motor cars. Corporators—Theodore Rohn, August F. Feldt, Louis G. Isaacs.

San Francisco, Cal.—Panama Rubber Co., of California, under California laws; authorized capital, $1,000,000; to manufacture tires. Corporators—W. D. Newerf and others.

Mercedes, Tex.—Sterling Automobile Co., under Texas laws; authorized capital, $10,000; to deal in motor cars. Corporators—A. G. Crawford, W. D. Chadwick, G. E. Simpson.

Elyria, Ohio—Garford Engineering Co., under Ohio laws; authorized capital, $100,000; to manufacture motor parts. Corporators—Sigmund Sanger, Walter F. Brown, E. C. Froelich.

Seattle, Wash.—Hugh A. Baird Motor Supply Co., under Washington laws; authorized capital, $10,000; to deal in motor car supplies. Corporators—Hugh A. Baird, George Emms.

Detroit, Mich.—Read Motor Car Co., under Michigan laws; authorized capital, $1,000; to manufacture and deal in motor cars. Corporators—Ray J. Read, Ray Herald and others.

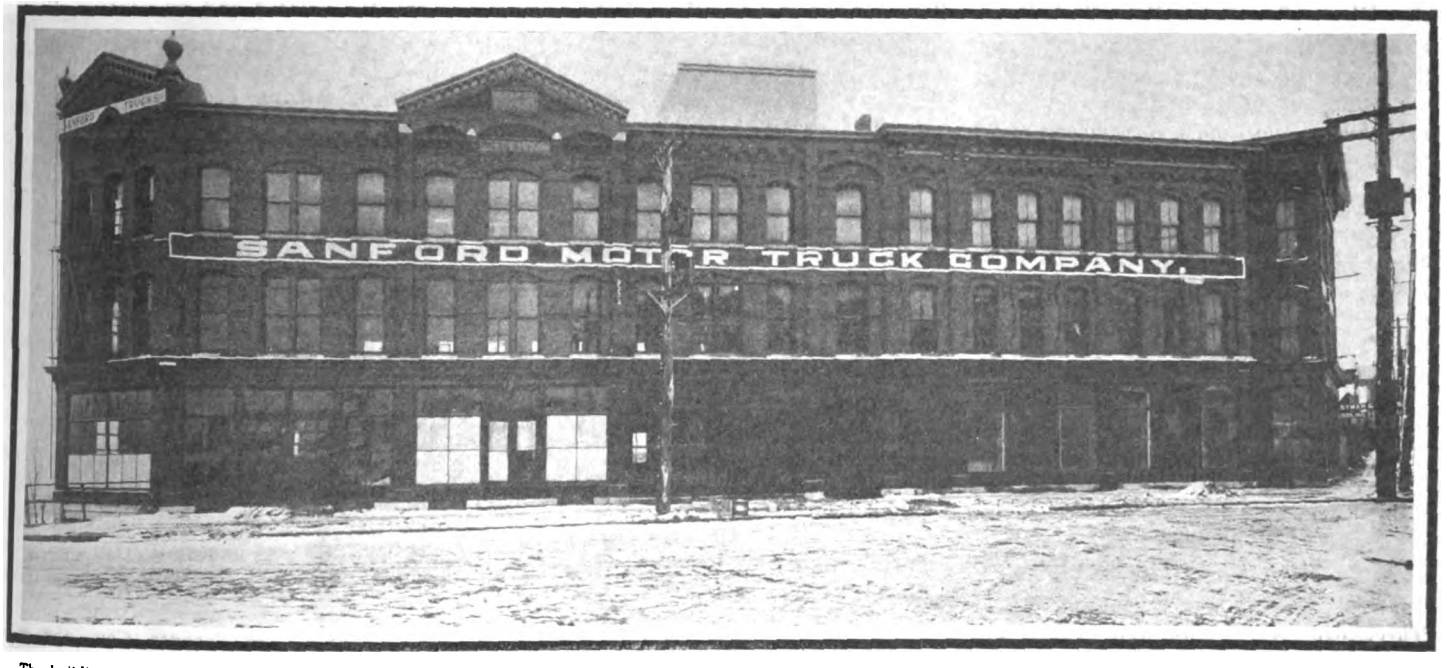
Terre Haute, Ind.—Johnson Bros. Motor Co., under Indiana laws; authorized capital, $70,000; to deal in motor cars. Corporators—Louis J. Johnson, J. W. Sackrider, Julius Johnson.

Cleveland, Ohio—Chandler Motor Car Co., under Ohio laws; authorized capital, $1,000; to deal in motor cars. Corporators—Isador Grossman, Claude W. Shimmon, Harry C. Gahn.

Detroit, Mich.—Detroit Coil Co., under Michigan laws; authorized capital, $10,000; to manufacture motor car devices. Corporators—C. C. Cleverdon, Joseph R. Cleverdon, John F. Stobb.

Oneida, N. Y.—Federation Supply Co., under New York laws; authorized capital, $150,000; to deal in motor car supplies. Corporators—Howell D. Crim, Timothy Curtain, Albert J. Seaton.

New York, N. Y.—Owners Purchasing Assn., under New York laws; authorized capital, $5,000; to deal in motor cars—Corporators—Leonard J. Field, Irving P. Regensburger, both of 1733 Broadway, Charles Olsen, 74 Broadway.



New York, N. Y.—Club Garage, Inc., under New York laws; authorized capital, $5,000; to operate a garage. Corporators—Jerome A. Davis, 605 West 11th street; Thomas A. Kilfoil, 251 West 109th street; Samuel I. Goldberg, 37 Liberty street.

Brooklyn, N. Y.—Williamsburg Plaza Garage, Inc., under New York laws; authorized capital, $1,000; to operate a garage. Corporators—Louis Cantoni, 17 Hillsdale avenue, Jamaica; Frank Furnell, 312 Keep street; Adolph Furnell, 197 No. 6th street.

New York, N. Y.—Eureka Machine Co., under New York laws; authorized capital, $5,000; to manufacture motor car accessories. Corporators—Joseph Prosky, 920 Tiffany street; Phillip Frankel, 28 Burling Slip; Frank A. Dillingham, Millburn, N. J.

New York, N. Y.—Manhattan Automobile

SANFORD MOTOR TRUCK CO.'S RECENTLY ACQUIRED FACTORY BUILDING IN SYRACUSE, N. Y.

The building is located on St. Mark's place between the Erie Canal and West Fayette street and measures 160 x 138 x 44 feet. It will permit the output of Sanford trucks to be doubled.

Digitized by Google

Club, Inc., under New York laws; authorized capital, $100,000; to conduct a social organization. Corporators—F. D. Dorman, Belleclair Hotel; A. B. Cordner, Riviera Hotel; E. E. Schwarzkopf, 233 West 83d street.

New York, N. Y.—Cortelyou Starter Co., Inc., under New York laws; authorized capital, $25,000; to manufacture motor starters. Corporators—John H. Miller, 61 West 108th street; Isaac B. Parker, 1261 Broadway; Otto F. Ochs, 141 West 16th street.

New York, N. Y.—Western Vehicle Co., Inc., under New York laws; authorized capital, $1,000; to manufacture motor vehicles. Corporators—Harry Davis, 76 West Tremont avenue; William E. Williams, 1948 Bathgate avenue; Charles M. Frost, 1966 Valentine avenue.

Brooklyn, N. Y.—Royal Garage & Machine Works Co., under New York laws; authorized capital, $3,000; to operate a garage and repair shop. Corporators—Frederick Kongeter, 2656 Pitkin avenue; William Schwenn and Louisa A. Schwenn, both of 779 Monroe street.

New York, N. Y.—Albert E. Eldredge Corp., under New York laws; authorized capital, $7,000; to deal in motors. Corporators—Albert E. Eldredge, 75 Echo avenue, New Rochelle; John J. H. Peillon, 532 West 143rd street; Julia M. Wilkinson, 60 Pearl street, Paterson, N. J.

Tarrytown, N. Y.—J. D. Maxwell Motor Corp., under New York laws; authorized capital, $10,000; to manufacture motor cars. Corporators—J. D. Maxwell, Tarrytown, N. Y.; James P. McManus, 361 50th street, Brooklyn; Leander F. Sniffen, 3411 Fort Independence street, New York City.

Tarrytown, N. Y.—Maxwell Motor Co., Inc., under New York laws; authorized capital, $10,000; to manufacture motor cars. Corporators—Jonathan D. Maxwell, 121 North Broadway; James P. McManus, 361 50th street, Brooklyn; Leander F. Sniffen, 3411 Fort Independence avenue, New York.

Recent Losses by Fire.

St. Paul, Minn.—S. L. Rader, 2844 12th avenue, garage damaged. Loss, $2,500.

Buchanan, Mich.—Lee & Porter Mfg. Co., factory partially destroyed. Loss, $75,000.

Syracuse, N. Y.—New Process Rawhide Co., factory offices damaged. Loss, $8,000.

Peoria, Ill.—Avery Mfg. Co., wheel house, grinding house, steel room and blacksmith shop destroyed. Loss, $225,000.

New York, N. Y.—Louis Burkhardt, 136 West 105th street, garage and seventeen cars destroyed. Loss, $100,000.

"PROS" AND "ANTIS" LINING UP ON NO-SHOW PROPOSAL

N. A. A. M. Executive Committee Votes to Continue Chicago Show —Suggestion of Summer Show in Detroit Advanced.

Despite the preponderance of favorable views received by Albert L. Pope, of the Pope Mfg. Co., in response to his suggestion that the national automobile shows be discontinued, it already has become evident that he and those who share his beliefs must overcome strenuous opposition before they can carry their point.

The executive committee of the National Association of Automobile Manufacturers, at its meeting in Chicago last week, practically ranged itself against the Pope idea. Pope himself is a member of the committee, although he was not present at the meeting, but the eight members who were in attendance voted unanimously to repeat the Chicago show, at least, in February, 1914. The N. A. A. M. has nothing to do with the New York show. The members who so voted were: S. T. Davis (Locomobile), Charles Clifton (Pierce-Arrow), Hugh Chalmers (Chalmers), L. H. Kittredge (Peerless), W. C. Leland (Cadillac), H. O. Smith (Premier), H. H. Rice (Waverley). W. E. Metzger, president of the association, was in the chair and, of course, did not vote.

There were also present at the Chicago meeting Samuel A. Miles, general manager of the N. A. A. M., and J. S. Marvin, traffic manager. Miles himself holds exclusive rights to stage automobile shows in the Chicago Coliseum, and since last week's meeting his office has supplemented the action of the N. A. A. M. executive committee by press matter designed to indicate that the continuation of the Chicago show, at least, is highly desirable. This publicity matter states that, far from desiring the show to be abandoned, a number of the car manufacturers have asked that the 1914 pleasure car section cover a period of 10 days instead of seven days, as heretofore.

It also is stated that 3,400 dealers attended the Chicago show and that some manufacturers who originally expressed themselves as favorable to Pope's idea since have explained that their attitude has to do with local shows and not the national exhibitions in New York and Chicago.

On the other hand, there are those who have rallied even more firmly to the Pope standard and who emphasized their position that the shows have outlived their usefulness, and that the great expense and far-reaching disorganization of factory and sales operations which they cause each year more than offsets any possible good they may serve.

One prominent manufacturer, who is not of the number that engages in spread-eagle show advertising, declares that the New York show alone entailed an expense of $30,000. Another, M. J. Hammer, general manager of the Abbott Motor Car Co., asserts that the industry owes a debt to Colonel Pope for taking the lead in the movement. He does not believe abandonment of the shows will cause the trade to suffer any reduction of business, and holds that if a national automobile show must be held it should occur during the summer, at about the time the manufacturers introduce their new models, and should be held at a midway point, preferably Detroit.

All of which makes evident that when the N. A. A. M. executive committee convenes in regular session next month there will be scope for pointed and momentous discussion.

Changes Among Prominent Tradesmen.

W. H. Williams has been promoted to the post of advertising manager of the Franklin Automobile Co. of Syracuse, N. Y. Previously he was assistant to George H. Bryant, who recently resigned to join the Locomobile staff.

C. A. Forster has been appointed commercial manager of the Maxwell Motor Co.—the old United States Motor Co.—and will make his headquarters in Detroit. Previously Forster was assistant general manager of the Burroughs Adding Machine Co., of Detroit.

Edwin Irving has been appointed manager of the Peerless branch in New York City, succeeding A. N. Dutton. Previously, Irving was manager of the National Electric Light Co. of Toronto, Can., and, it is stated, long has been identified with the Terry interests which recently acquired control of the Peerless Motor Car Co.

Arthur J. Interrieden has been appointed sales manager for the Jones Speedometer Co., of New York. For many years he was the manager of the Warner Instrument Co.'s branch in the big city, and when the Warner interests were merged into the new Stewart-Warner Speedometer Corporation he became the latter's Eastern sales manager.

W. W. Wuchter, former president and general manager of the Swinehart Tire & Rubber Co. of Akron, Ohio, has become connected with the Gibney Tire & Rubber Co. of Philadelphia, Pa. Previous to his connection with the Swinehart establishment, Wuchter had enjoyed many years' experience with the Goodrich and Firestone companies.

In the RETAIL WORLD

Rosenhauer & Echerman have opened a garage in Early, Ia.

George W. Hoch, Jr., is having a garage erected in Canonsburg, Pa.

The Modern Garage Co., of Titusville, Pa., is building a new garage.

H. S. Titus & Son have opened a garage and supply store in Penns Grove, N. J.

W. C. Radley of San Diego, Cal., has sold the Grant Hotel Garage to George F. Barner.

H. S. Pulliam, of Lawton, Okla., is remodeling a building in which he will open a garage.

Hart & Starry have opened a garage in Olin, Ia. They also have secured the Krit agency.

Walter S. Vanderbilt has embarked in business in Tarrytown, N. Y. He has the Studebaker agency.

Emil Hulstrom has purchased a bowling alley building in Woodhull, Ill., and will convert it into a garage.

Leslie Tuthill is erecting an $8,000 garage in Visalia, Cal. He will operate under the style Main Street Garage.

The Red Wing Auto Co. and the Remshandt & Oliva Auto Co., both of Red Wing, Wis., have consolidated.

J. H. Benjamin, Jr., and A. C. Benjamin have purchased the Ford Garage in Red Bluff, Cal. They will operate it.

S. A. Collins & Co., of 2124 Cummings street, Omaha, Neb., plan to erect a new garage; the estimated cost is $20,000.

John Paire, of Baxter & Paire, garagemen in Hillsboro, has bought out his partner; he will continue the business alone.

Stephen Gyrfas, of Newark, N. J., has had plans prepared for a two-story brick garage and machine shop; it will cost $5,000.

W. S. Arbogast has purchased the interests of A. D. Stocker in the Economical Tire Co., of 415 East 3d street, Dayton, O.

Charles Sands has opened an automobile supply store in White Plains, N. Y. He is trading as the New York Auto Supply Shop.

A. N. Black has given up his agency in Peoria, Ill., and will devote all his time to the real estate business; he handled the Ford.

H. L. Kemp and G. H. Larned have opened salesrooms in Boston at 1070 Boylston street; they represent the Westcott line in New England.

O. F. Embertson and H. J. Ilson of Litchville, N. D., are about to open a garage in Valley City, in the same State; Ford cars will be stocked.

B. S. Bryant and E. J. Bigue have opened a garage in Claremont avenue, in the residential section of Oakland, Cal. The name adopted is Service Garage.

Thomas Hay, former Chicago Ford manager, has taken over the Staver agency for Northern Illinois, Eastern Iowa, Southern Michigan and all of Indiana.

The Colonial Motor Co., of Baltimore, Md., has opened a new garage on North avenue, east of Charles street; chauffeurs' recreation rooms are a feature.

Knox & McCauley, of Abilene, Tex., have sold their supply business to the Fulwiler Electric Co. The former will devote themselves to their garage buisness.

Robert Kilgour & Sons have purchased the Ontario Motor Car Co. of 18 Bloor street, East, Toronto, Ont. The deal carries with it the Packard agency.

The Faissole Auto Co., Inc., of 131 West 42d street, New York City, is about to change its name to Cosmo Auto & Touring Co. Charles A. Faissole is president.

C. D. Miller has disposed of his interest in the Grand Rapids (Mich.) Auto Co. His offices of president and treasurer have been filled by the election of A. B. Olmstead.

J. I. McFarland has inaugurated a two-story garage, 40 x 100 feet, adjoining the Kimball Hotel in Lodi, Wis. It cost $12,000. He will handle the Ford and Studebaker lines.

City Automobile Co. is the name which has been chosen by P. J. Albers and H. H. Hagedorn, who recently entered the trade in Luverne, Minn. They have the Overland agency.

The Reading (Pa.) Motor Vehicle Co. has been formed with Harry E. Eisenbise as manager; it will distribute Rowe trucks and a line of fire apparatus which incorporates patents held by Eisenbise.

Fred Offenhaeuser and Frank W. Dotsch are about to establish a garage business in White Plains, N. Y. They formerly were employes of the Maxwell-Briscoe Motor Co., of Tarrytown, in the same state.

Harry F. and W. G. Bailey, who have conducted a garage and supply store in Hartford, Conn., on George street, have dissolved partnership; the former will continue the business under the style Harry F. Bailey & Co.

The Franklin Automobile Co.'s branch in Rochester, N. Y., at 86 North Adams street, has been taken over by G. R. MacCollum and T. J. Stevens, who will operate it on a dealership basis; the style will be Franklin Motor Car Co.

The Rubber Tire Repair Co., of Kansas City, Mo., has taken over the Shawmut agency; Henry A. Winter, manager of the company, has been made factory representative of this brand of tire in the territory in and about Kansas City.

The Peerless Motor Transfer Co., of Washington, D. C., has changed its style to C. B, B. Motor Co. The concern retains its location at 511 I street, Northwest, and will continue to handle Peerless cars and trucks and Kelly and Modern trucks.

The Martin-Matteson Garage Co., formerly located on North Seminary street, in Galesburg, Ill., has completed a new garage at Cherry and Waters streets; there is storage room for 30 cars. The company has the Apperson and Paige agencies.

The King Motor Sales Co. has entered the selling field in Kansas City, Mo., at 1625-27 Grand avenue, selling King cars. C. E. Hathaway, who has been in the trade in and about Kansas City for eight years, is at the head of the new business.

Charles Colton has sold his interest in the Milbank (S. D.) Auto & Supply Co. to Arthur Partridge, who, with Albert Partridge, constitutes the remainder of the firm; they will continue the business as heretofore, retaining the Ford, Chalmers and Studebaker agencies.

E. L. Kaufman of Keota, Ia., has purchased a half interest in the Lawler Garage in Wellman, in the same State; the name of the business has been changed to Kaufman-Lawler Auto Co. Kaufman will act as manager and the building will be remodeled and enlarged.

Henry L. Wedemeyer, for the last two years superintendent of the Foster Gear

Digitized by Google

Co., of Columbus, Ohio, has taken over the garage business of the Adamson Auto Co. in that city, located at 35-39 West Mound street; the new style is Adamson-Wedemeyer Auto Co.

Frank V. P. Ellsworth, who toured from Hot Springs, Ark., to San Antonio, Tex., in November in the interests of a tire company, has located permanently in the latter city, where he has launched the Jackson Auto Co. Jackson cars are stocked. Ellsworth is president of the company.

J. J. Schuur has entered the trade in Jackson, Mich. He has opened a garage and salesrooms at 115 Eleanor street and has secured the agencies for the products of the Maxwell Motor Co., which was the United States Motor Co. Schuur is the owner of a basket factory at Paw Paw, Mich., and also is a large celery shipper.

Edward Williams and George Medlam, copartners, trading as the Medlam Automobile Co., in Columbus, Ind., have dissolved partnership; Williams will continue to operate the garage, which is located on South Franklin street. The Overland agency, which was conducted by the partners, has been taken over by A. T. Griffith.

To deal in used cars the United Automobile Clearing House Co. has been formed in Cincinnati, Ohio, with quarters at 324-26 West Court street. The officers are: President, Thomas A. Reilly; vice-president, S. D. Bromley; secretary, Edwin P. Bernardi; treasurer, A. M. Hirsch. Private owners will be charged a selling commission of 10 per cent.

W. W. Denis has purchased the interest of Robert Wynn in the Standard Auto Garage of Sault Ste. Marie, Mich., and the business has been renamed Lock City Auto Co. The officers of the new company are: President, A. H. Passmore; secretary and treasurer, W. W. Dennis; manager, Percy Elves; the transfer of interests carried with it the Oakland and Buick agencies.

W. M. Whitney & Co., of North Pearl street, Albany, N. Y., have purchased the building of the Buick Motor Car Co., at Washington avenue and South Swan street and will remove to that location April 1. The Buick building is of four stories, and a fifth may be added later. The Whitney company recently took over the United Motor Albany Co. and the Albany Motor Car Co., which gives it the agencies for the Maxwell, Cadillac and Mercer, in addition to the Fiat, which it formerly held. Westcott Burlingame, the company's manager, formerly was with the Buick agency, but was assistant manager of the United Motor branch when it was taken over. The Whitney company does not acquire the Buick agency.

COHEN SUES FOR BLIGHTED HOPES AS O.N.L.Y. DEALER

Claims Demonstrating Car for Which He Paid $1,000 Has Yet to Make Its Appearance—Demands Profits He Didn't Make.

According to the attorney for Dudley H. Cohen, of New York City, the O. N. L. Y. Motor Car Co., of Port Jefferson, L. I., whose claim to fame rests on a motor having a 7⅞-inch stroke, has been working diligently since last September in an effort to turn out a demonstrating car for Cohen, who claims he paid $1,000 for such a vehicle in the expectation that he was going to sell 200 O. N. L. Y.s in the State of New Jersey in the year beginning September 3, 1912, which venture, he says, came to naught. His whole tale of grievances, which takes the form of the complaint in a suit in the Supreme Court for New York county, is summarized in a request for $14,244, and on the strength of his story the court on Friday, 8th inst., granted him an attachment for that amount.

Cohen's plaint is that he signed up as New Jersey distributer, first paying $1,000 for one of the 7⅞-inch-stroke cars, and contracted for 200 cars, to be delivered in twelve equal monthly instalments. He also was permitted by the contract to sell 40 cars to sub-dealers in his territory, and states that he executed these sub-contracts and was all ready to put the cars into the field but that the Port Jefferson company failed to get even so far along as to deliver the demonstrating car.

His claim of $14,244 is arrived at through the combination of several items, the first of which is the $1,000 he paid for the demonstrating car and for which he got no car and has not been able to get his money back. Claim No. 2 is a profit of $2,500 which he would have received on the 40 cars had he delivered them to his sub-dealers, the profit for him on each car being $62.50. The third claim consists of the profits which the sub-dealers would have made, buying at $1,062.50 and selling at $1,250 had Cohen been able to deliver the cars to them, and since he was not he includes this item as being a claim for which the O. N. L. Y. company has made him liable. It is $7,500. Also he expected to make a profit of $70 on the equipment for each car, which item is $2,800, and besides this he claims to have spent $444 in various ways.

Notes Involve Dealer in Trouble.

Elmer E. Rhodes, a dealer in Joliet, Ill., and who also has earned some fame as a racing driver, has become involved with the authorities in that city and has been held to await the action of the Will county grand jury because of alleged irregularities in a check deal following the sale of a car to Mart Shire, a retired Joliet farmer. According to the charges, Rhodes sold the car to Shire and in part payment took two notes aggregating $1,000, which he turned over to the Manhattan bank as collateral security on a loan. Later, it is said, he induced Shire to make payments of $400 and $300 on the notes, the later being in ignorance of the bank's equity in the paper. The specific charge is that Rhodes held out $400 which should have been turned over to the Manhattan bank.

Minor Business Troubles.

The Glide Automobile Co., of 517 Second avenue, South, Minneapolis, Minn., has filed a voluntary petition in bankruptcy; its debts amount to $3,016.88 and its assets to $4,572.90.

Judgment for about $6,000 was taken this week by the Benz Auto Import Co., of New York City, against the Hearne Motor Co., of Chicago, the claim being for cars and parts supplied to the Hearne company as Benz dealer. The Hearne company is now involved in bankruptcy proceedings.

Upon a claim of $19,263 made by the Dayton Auto Truck Co., nine trucks, the property of the Motor Renting Co., of 145 West 110th street, New York City, are to be sold at auction by the sheriff Monday, 17th inst. The trucks have been taken on a writ of seizure and the sale will be held at 524 West 36th street.

Gere Goes Into Electric Vehicles.

Theodore D. Gere, who has been acting as one of the receivers of the Champion Wagon Co., of Owego, N. Y., since January 9, 1911, has asked to be relieved of his duties. He, with several other men, has organized the Empire Electric Vehicle Co., in Owego, and it is his desire to devote his entire time to that enterprise.

Rubber Company Beats Garage Firm.

Weingarten & Durst, garage and supplymen in New York City, were unsuccessful in defending a suit this week, brought in the New York City Court by the National India Rubber Co., the rubber company asking the face value of a note and interest; the amount awarded the plaintiff was $1,059.

Michelin Sues an Ohio Customer.

The Michelin Tire Co., of Milltown, N. J., is the complainant in an action which was filed last week in the Common Pleas Court in Canton, Ohio, against the Auto Service Co., for $585; the sum is claimed to be the balance due on an account.

Subscription, Per Annum (Postage Paid) $2.00
Single Copies (Postage Paid) . . . . . 10 Cents
Foreign and Canadian Subscriptions $3.00
Invariably in Advance

Postage Stamps will be accepted in payment for subscriptions. Checks, Drafts and Money Orders should be made payable to The Motor World Publishing Co.

Change of advertisements is not guaranteed unless copy therefor is in hand on SATURDAY preceding the date of publication.

Contributions concerning any subject of automobile interest are invited and, if adequate, will be paid for; or, if unavailable, will be returned provided they are accompanied by return postage.

Cable Address, "MOTORWORLD," NEW YORK

Entered as second-class matter at the New York Post Office, November, 1900

NEW YORK, FEBRUARY 13, 1913

PARCEL POST AND ACCESSORY DEALERS.

What will be the effect of the parcel post on the retail dealers in all lines of trade is one of the questions growing out of the government's new service which is not yet capable of answer. In some measure designed to strike at the so-called express monopoly, there at all times have been forebodings that once inaugurated the service would make things unduly uncomfortable for the retailer, particularly the small ones in small towns, if it did not result in forcing many of them out of business.

It had been thought probable that the gigantic mail order houses would so greatly benefit by the new rates that the small dealer would be unable to cope with them, but regardless of such possible effects it already has become clear that the almost immediate effect of the parcel post has been to give the local retailer more scope than ever to meet the competition of mail order establishments.

Whereas, under the old order of things, the latter could send their smaller packages through the mails for any distance at a flat fourth class rate, the zone system created by the new regulations eliminates that advantage and requires that the amount of postage shall be governed by the distance the package is to be transported. Thus, the cost of mailing, say, a ten-pound package 1,500 miles is $1.01, but a local dealer can send the same package 50 miles for 32 cents. The difference in many cases will be sufficient to more than offset the difference between the catalog prices of mail order goods and the retailer's prices.

Whether the savings on "short distance goods" will equalize things for the mail order people, probably they themselves will not be able to tell for at least a year.

At this time, it appears that to offset the unlooked-for conditions, the mail order people must do one of two things; reduce the price of their wares or set up branch establishments at various central points. In either case, it means a marked reduction of their earnings. The discomfiture of the mail order houses, however, will cause few tears to be shed. Rather does it indicate that the parcel post has opened to local tradesmen unlooked-for opportunities.

There is no good reason why the wide-awake dealer in automobile accessories cannot immediately and very considerably enlarge his scope and acquire control of a large part of the trade within his zone which previously was beyond him. To do so will require a display of real enterprise and some small expenditure for printed matter and postage stamps. Dealers in other lines already have grasped the opportunity and the automobile accessory tradesman who does not do likewise will have himself to blame if the parcel post cuts into his profits or otherwise causes discomfiture.

PUTTING ENGINEERING PRACTICE TO SCORN.

"Revolutionizing" motors have been so very numerous of late years that most engineers are likely to give scant notice to any newcomer, particularly one that is devoid of such things as piston rings, so dear to the heart of all engineers, and so generally considered to be absolutely indispensable. Still, the Tismer engine, which was illustrated and described in Motor World last week, has no piston rings, and yet it works and for the elimination of the rings the inventor would seem to have a very good reason.

It is his opinion that the rings serve mostly to scrape the cylinder clear of the lubricant, which, of course, must be constantly renewed to avoid metal-to-metal contact, and to eliminate the "waste" represented by the constant replenishment he provides a perfectly plain piston, which fits so loosely in the cylinder that the film of oil is comparatively thick, the theory being that the thick film prevents rapid dissipation of heat and at the same time prevents loss of compression as effectively as would piston rings.

It is even more difficult to comprehend why this engine runs on heavy oil sucked into the cylinder in a solid body, when it is not easy to burn even lighter oils with the aid of complex spraying and injecting devices. Yet this is what the engine does; at least, it takes its fuel through a plain pipe and a hole in the head, and if there is any spraying action it is unintentional.

It may be that more extensive tests will develop flaws in Tismer's reasoning and defects in his engine. The fact remains, however, that Tismer has disputed the necessity—even the advantages—of things that hitherto have been deemed indispensable, and his motor seems to bear him out in every way. Even if the engine does not come up to the naturally high expectations of the inventor it should furnish considerable food for thought; while if it fulfils its promise it will upset theories that have been considered impregnable since the first gasolene motor made its initial revolution.

BROOKLYN GARAGEMEN UNITE TO COMBAT EVILS OF TRADE

Batt Heads New Organization, Which Intends to Deal With the Gasolene Question—Other Purposes To Be Served.

The incorporation last week of the Brooklyn (N. Y.) Garage Owners' Board of Trade has served to bring into greater prominence another phase of the "gasolene situation" with which garagemen across the river from Manhattan have been wrestling for more than a year, or since the price of fuel first started on its eventful upward career. The particular phase lies in the retail sale of gasolene by small dealers whose "overhead" expense is low at a price which prohibits what one prominent garageman and dealer in the new organization apostrophized as a "living profit," and it is one of the principal objects of the organization to "stamp out this evil"—to prevent cut-throat methods in the sale of fuel and to maintain an arbitrary standard retail price which shall insure a reasonable margin of profit. Just how the problem will be attacked is not divulged, though it is freely hinted that the necessary steps will be directed against those who supply the fuel to the garages and not directly against the gasolene dealers themselves.

Of course, the organization has other objects as well, though the regulation of the price of fuel is one of its principal ones, and if it does not do all it intends to do it will not be for lack of strength. Already a majority of the more prominent garagemen in Brooklyn have "signed up" and more are clamoring for admission. Charles F. Batt, a veteran of the trade and head of the Grant Square Garage Co., of 1378 Bedford avenue, where headquarters of the Board of Trade have been established, is president and associated with him are Anthony J. Sweeney, of Sweeney & Nail; E. J. Dennie, of the Clinton Garage Co.; A. W. Blanchard, the Brooklyn Fiat dealer, all of whom are vice-presidents; J. F. McCormick, of Bishop, McCormick & Bishop, who is treasurer; and Arthur J. Farrel, of the Farrel Auto Co., who is secretary. The directorate is composed of these men and C. M. Bishop, Norman A. Bradt, Emil Bauer, H. F. Cornelius, George V. Johnson, W. H. Kowenhoven, J. W. Mears, H. Pastre, F. M. Powell, Oliver Spitzga, Frank Sands, W. S. Wood, Robert P. Lumely, J. Van de Veer, J. C. Kirkham, H. L. Carpenter, and D. M. Hasbrouck. Practically all of these men are members also of the Brooklyn Automobile Dealers' Association, which, of course, is a separate and distinct organization; it is the intention that they shall not conflict in any way.

Briefly, it is the purpose of the newly formed Board of Trade to foster what is judged to be helpful and to combat what is judged to be harmful legislation aimed at the regulation of public garages; to obtain and circulate among its members reliable and accurate information concerning investments and the management and operation of garages, and "to secure uniformity and certainty in the customs and usages of trade and commerce in governing the sale and storage of automobiles."

Seacoast Takes Over Two Garages.

The so-called National Automobile Owners' Association of Asbury Park, N. J., which was formed last summer, has been absorbed by the Seacoast Garage & Supply Co. of that city, which was incorporated three months ago with an authorized capital of $25,000. The absorption was largely in the nature of a change of name, as the officers of the association also were taken over by the Seacoast enterprise. They are: John Hulshart, president; Arnold N. Hulshart, vice-president; William F. Pattison, secretary and assistant manager; Dave W. Edwards, treasurer and general manager. The Seacoast company will control the Grove Garage in Asbury Park and the Woolley Garage, which is in Bradley Beach, N. J.

Winton Opens Three More Branches.

Having decided to increase considerably the number of its branch houses, the Winton Motor Carriage Co. is proceeding with the work. Among those recently established are branches in St. Paul, Portland and Walla Walla. The manager of the St. Paul branch is Le Roy Eschner, who previously was connected with the Winton branch at Chicago, while the men in charge of the Portland and Walla Walla branches are, respectively, H. R. Roberts and E. H. Gates.

Building for Studebaker in Omaha.

For the occupancy of the Studebaker Corporation, contracts have been let for the erection at Twenty-fifth avenue and Farnam street, in Omaha, of a four-story building, 75 x 140 feet; it will have a front of red brick with cream or white trimmings. As soon as completed, the Studebaker branch in Omaha will remove from its present address, 2026 Farnam street.

Woodward Succumbs to Pneumonia Attack.

Roy Woodward, who represented the Kelly-Springfield Motor Truck Co. in the South, died of pneumonia in Indianapolis on Thursday last. He was 29 years of age and a native of Bloomington, Ind.

February 8-15, St. John, N. B.—First annual show of the New Brunswick Automobile Association in the Drill Hall.

February 8-15, Youngstown, Ohio—Annual show of the Youngstown Automobile Show Co. in the Auditorium and Annex.

February 8-15, Hartford, Conn.—Sixth annual show of the Hartford Automobile Dealers' Association in the State Armory.

February 10-15, Minneapolis, Minn.—Minneapoils Automobile Show Co.'s show in the National Guard Armory.

February 10-15, Chicago, Ill.—National Association of Automobile Manufacturers' 12th annual show in the Coliseum and 1st Regiment Armory. Commercial vehicles only.

February 12-15, Geneva, N. Y.—Annual show in the State Armory, under the auspices of the Ottawa Valley Motor Car Association.

February 15-22. Albany, N. Y.—Annual show of the Albany Automobile Dealers' Association in the State Armory.

February 15-22, Newark, N. J.—New Jersey Exhibition Co.'s Sixth annual exhibit in the First Regiment Armory.

February 16-23, Richmond, Va.—Richmond Automobile Dealers' Shows Co.'s exhibit in the Horse Show building.

February 17-27, Kansas City, Mo.—Kansas City Automobile Dealers' Association's show in Convention Hall. First week pleasure cars; second week commercial vehicles.

February 17-22, Jackson, Mich.—Jackson Automobile Dealers' Association's annual show.

February 18-22, Baltimore, Md.—Baltimore Automobile Dealers' Association's annual show in the Fifth Regiment Armory.

February 19-22, Kalamazoo, Mich.—Kalamazoo Automobile Dealers' Association's annual show.

February 19-22, Davenport, Ia.—Annual show of the Tri-City Automobile Dealers' Association in the Coliseum.

February 20-22, Canandaigua, N. Y.—Motor Car show in Hawley's Garage, under the management of A. Blumenstein.

February 22-March 1, Brooklyn, N. Y.—Brooklyn Motor Dealers' Association's annual show in the 23rd Regiment Armory.

March 8-15, Boston, Mass.—Boston Automobile Dealers' Association's annual show in Mechanics' Hall. Pleasure cars only.

BENEFITS OF PARCEL POST ACCRUE TO LOCAL DEALER

Mail Order Houses Now Bothered by Perplexing Problems—How Zone System Gives Retailer Room to Compete.

Despite the general belief that mail order houses jumped for joy when the parcel post was inaugurated, it appears that their joy, if any, was ill-timed, or that their jumps were comparatively short ones. For, after a month of actual practiec, the parcel post has caused many of the mail order people to wrinkle their brows and to resort to an extensive use of their pencils to discover just "where they are at." Similar beliefs that local retailers would be seriously affected by the competition of mail order houses has proved not wholly justified, as the more enterprising dealers, at least, have discovered that the parcel post has opened to them opportunities which previously did not exist.

Comparison of New and Old Systems.

The section of the new regulations which causes this not widely understood condition is the "zone system." While the opposing argument was that the Parcel Post would permit the mail order house to compete with the local retailer by sending cut rate goods into the retailer's territory, the mail order house is, in fact, not so well off as heretofore. Whereas fourth class matter before the adoption of the Parcel Post permitted mailable material to be sent any distance for a flat charge, under the new system the charge increases with the distance. Therefore, a mail order house in Chicago, for instance, can compete with the Chicago retailer, but as the distance between the mail order house and the customer increases and the customer falls within higher-rate zones the cost of delivery becomes heavy and the local retailer in these latter zones is able to mail goods to his customers at less cost than can the distant mail order man. The "zone system" narrows the mail order field to a restricted territory and the retailer, whose natural trade area is perhaps of 100 miles radius, is able to use the Parcel Post at less cost than the mail order house, provided the retailer is any appreciable distance from the city where the big competitor is located.

Practical Effects of the Zone Plan.

Thus, according to the law, a local dealer located, say, in Kansas or Nebraska, approximately 500 miles from Chicago and, therefore, within the fourth zone, can mail a five-pound parcel to any address within his zone—50 miles—for 17 cents, whereas, to reach the same customer, a package of the same weight would cost the Chicago mail order house 32 cents in postage. An 11-pound package, which is the parcel post limit, would cost the Kansas or Nebraska dealer 35 cents within his zone, while the Chicago mail order house would be required to pay 68 cents.

Dealers and Their "Natural" Customers.

But even these figures do not make wholly plain the advantages possessed by the local retailer, for the "local rate"—which means the rate applying to any postal district, as, for instance, a rural delivery route, the limit of which is 25 miles—is five cents per pound for the first pound and one cent for each additional pound. This means that the local dealer can send to what should be his natural customers a five-pound package for nine cents, or an 11-pound package for 15 cents, while the cost to the Chicago mail order people would be, respectively, 32 cents and 68 cents. The differences are sufficiently great to permit the wide-awake dealer to make things more interesting for mail order competition than previously was the case.

Under the old order of things, when the fourth class rate of one cent per ounce applied, regardless of distance, both the local dealer and the mail order house could mail merchandise only in parcels not exceeding four pounds, on which the rate was one cent per ounce, or 64 cents for a four-pound package. Exceeding four pounds, the merchandise became ineligible as mail matter and necessarily was shipped by freight or express.

The Plaint of a Mail Order Man.

A former mail order man, who, following the inauguration of the new post, has entered the retail trade, states that the innovation has worked a hardship to the mail order business. "To believe," he says, "that the Parcel Post as provided for under the present law is going to increase the advantages which such houses possess over the local dealer is to betray either an utter ignorance of the facts or an utter inability to reason logically. For now, instead of being on an exactly equal basis, so far as the mails are concerned, with the local retailer, the mail order house must pay postage based on the distance between its office and its customer, while the dealer is allowed to mail goods to his customer at a postage rate based on his proximity. Since the passage of the Parcel Post act there has been a marked absence of anything approaching joy in the mail order circle. A diminution of the cost of carriage on light goods only operates in the retailer's favor by permitting him to use rural free deliveries and reach his country customers far more easily than he has ever been able to do."

Solutions Needed for New Problems.

He also states that, should the mail order house attempt to meet the new conditions by establishing branches for the purpose of taking advantage of the zone rates, the overhead and other costs would at once prove a tremendous handicap to the companies, and he adds that he confidently expects to see the retailer become a worthy rival of the mail order man. Summarizing, he states:

"This new system puts every manufacturer, every jobber, every retailer, into direct competition with the mail order house and gives a tremendous advantage to the retailer and to the jobber by reason of the proportionate rate. It brings up an entirely new set of problems and difficulties in the mail order business, it must inevitably lead to the essential changes which will increase costs and diminish profits, it gives the mail order house not one single benefit to offset these disadvantages and it gives the retailer not one single disadvantage to offset the benefits."

Aetna's Insurance Plans Unfolding.

The Aetna Accident & Liability Co., of Hartford, Conn., which recently purchased the charter of the Manufacturers' Fire & Marine Insurance Co., has applied to the Connecticut legislature for permission to change the name of its acquirement to the Automobile Insurance Co. of Hartford and to increase its capital stock from $200,000 to $2,000,000.

The Aetna company only recently instituted a radical departure from previous insurance practice in formulating and offering for sale a single policy covering all forms of automobile risks, liability, property damage, collision, theft and loss of use, and its action in seeking to create the Automobile Insurance Co. of Hartford is taken to mean that the latter will be the medium through which the new policy will be exploited.

Parcel Post Not for Catalogs.

Reversing a previous ruling, the postmaster general has decreed that general catalogs cannot be shipped with merchandise at parcel post rates; they must pay third-class postage. Literature referring to a particular article may be included with it at parcel post rates, but if the printed matter deals with anything else it must be entered as third class matter. In other words, spark plugs, for instance, shipped by parcel post may be accompanied by circulars describing them, but if such printed matter refers to other articles it must pay the higher rate.

BEING SQUARE WITH BUYERS

Attempts at Dickering Are Resented by the Man Who Knows Values—Methods Which Won and Methods Which Lost Important Sale.

In a city the name of which need not be mentioned, a man had planned to buy a car. He wanted a good one. He had certain definite ideas as to what constituted a good car, so he confined his investigations to three or four that he felt quite certain came within the range of his requirements. Investigation among friends and acquaintances, and a more or less thorough knowledge of values, gradually narrowed his interest to two cars; so he invited representatives from both agencies to call on him.

The first salesman came and submitted his complete proposition; told him exactly what he would furnish in the way of equipment; said he could have any body style he chose, any special leather for upholstery, any finish or trim, and went into the smallest details in an effort to get a masterful grasp of what the prospective purchaser wanted; then he named a price for the complete job and another price for the chassis only, with lighting and starting equipment.

Unfair Charge for Regular Equipment.

Not long afterward the second salesman arrived. And please remember that the buyer was not prejudiced in favor of either car. The scales, as far as he was concerned, were even—either car would suit.

Photographs were produced, the customer's idea of a body discussed at length and, after mechanical details were gone into to the perfect satisfaction of the customer, prices were submitted.

"Does this price include the electric starting and lighting system? Does it include a Klaxon horn?"

"No; those are extras, and will cost you $350," answered the salesman.

"No, they won't; I'll not pay a cent extra for them. Do you mean to say that you can look me in the eye and honestly say that your car is worth $350 more than the ———? Come, tell me frankly how and wherein your car is worth the extra money."

"Well, Mr. Buyer, I'll tell you what I'll do. I will include those extras at the price named."

"No, you won't!" warmly responded Mr. Buyer, "it's too late now. Nothing doing! I am going to buy a ———."

Pared Prices Shatter Buyer's Faith.

And it was too late. The buyer would not listen to argument. His faith in the salesman and his car was shattered by the attempt to get the extra money and the quick backdown when he forced the issue.

The first man had studied his customer and laid all his cards on the table during his first visit. The second man came prepared to dicker. He did not know the kind of man he was going to meet. He lost an important sale through unpreparedness.

Car buyers are becoming keen on values. They cannot be fooled, and unless the salesman is absolutely sure that his prices are justified and knows why and wherein they represent dollar-for-dollar value, he is bound to be up against it.

WHY SHOW WINDOWS SHOULD BE CHANGED FREQUENTLY.

What can you do to give your show windows a fresh interest? It's the constant change of display that interests and holds the public, and it is proper, therefore, that you should ask yourself during how much of the year has your window looked exactly as it looks to-day.

If you are an accessory dealer, remember that masses—not mixtures—of goods make the strongest appeal to the eye. Call to your aid all the adjuncts of color and light. Use signs, but not too liberally. But change and change often. Your display is for the people who are passing—and most of these pass several times a day. People get into habits.

Challenge the attention of your regular customers by your display, also. Don't let them "get used" to your windows. Wake them up! Show them something new—something different each time they come in. Change! Change! That is the secret of successful window displays.

QUICKWITTEDNESS IN SALESMEN.

History records more than once how a quick answer has saved a situation. Happy is the salesman who is gifted with the "quick come-back," which is another word for quickwittedness.

Entering the lobby of the Claypool at Indianapolis, a parts salesman ran plump into one of his best customers, the purchasing agent for a big Indianapolis factory.

"You're just the man I want to see," said the purchasing agent. "I have a bone to pick with you. I understand you make Ford a price very much lower than what we are paying. We are not going to pay a cent more than Ford."

Quick as a flash the salesman handed over his order book to the purchasing agent.

"You don't have to," he responded. "Here, take this order book and write out your own order at the same prices—only it must be for the same size part and for the same quantity."

The purchasing agent did not even ask how many Ford bought. He handed back the order book without comment. He is still buying parts from this salesman.

Good salesmanship means more than merely getting the order. It means establishing an appreciation of value in the mind of the customer so solidly that the order comes, whether you call for it or not.

AWAKE N DISING WORLD

UNTOUCHED SALES HARVESTS

Many Men Who Are Abundantly Able to Own a Car Never Have Been Approached—Salesman Who Canvassed Office Building.

Who wants to buy a car? Many dealers and salesmen would give some real money to be put in possession of reliable information on that point, and yet it ought not to be very hard to obtain it. The trouble with many saleswen is that they confine their energies to the small circle of their acquaintances, the leads that occasionally come from the factories; the people who "dropped in the store once to look over the line," the prospects they saw or heard the Crescent salesman had taken out, and the more or less up-to-date list of prospects that has been in the making since the business started.

Salesman Made To Dig Up Prospects.

One organiation whose name is synonymous with success uses all the old methods as far as they go and adds one that has proved mighty effective. When a new salesman is hired he is told to go out and dig up prospects. For example, in the city of Chicago one was given two weeks in which to call on every person in a certain large office building. Naturally it seemed "just like a book agent" to this salesman at first; but after three days he rather liked it. He had made many new friends and secured several valuable tips which, inside of sixty days resulted in the sale of seven cars.

Much reading of what constitutes a good salesman won't make one. It merely points out some of the ways. It suggests; and, if the man is ambitious, he will take from his reading what he needs and use it.

A few doors away from where this is being written lives a man who owns real estate valued at approximately $15,000. He is an officer in a large manufacturing company and has a yearly income in excess of $5,000. He is very busy—so busy that he has never really got down to brass tacks on the car question. He said yesterday that he had never been approached by an automobile salesman, nor has he ever received a circular letter, a catalogue or any other literature from any automobile factory or dealer. Two doors from him is a merchant who owns a handsome home, has a half interest in a large downtown business; in a word, a man who has ample means to buy and maintain a good machine. He likewise never has been approached. Three blocks away is a garage where several salesmen hang out and wonder why business is so dull.

Like the "Acres of Diamonds" Story.

It is like Russell Conwell's story, "Acres of Diamonds," in which a farmer grows so discouraged with conditions on his farm that he sells out. He goes west, where there is more money to be made, and at the end of three years returns to find that the farm which he despised contained rich coal deposits which had made his successor a rich man.

There are many dealers who are neglecting or overlooking similar precious opportunities. A well dressed, polite young man would canvas the average neighborhood in a week and get information that an experienced salesman could turn into cash.

Can there be any better way to get first hand information? Why not try prospecting among the "Acres of Diamonds" that lie at your door?

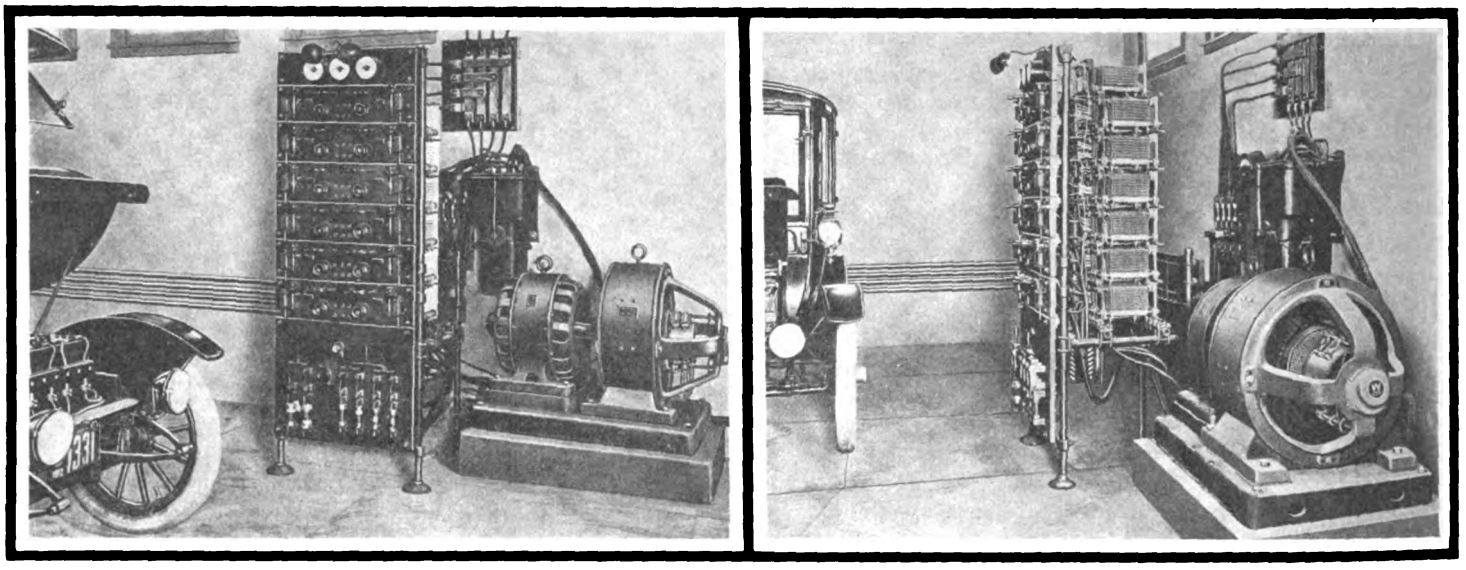
CHECKS FOR GARAGE TRANSIENTS.

Hyslop Bros. of Toronto, whose up-to-date methods previously have been remarked by Motor World, give transients checks for their cars when they are left over night. Thus, when a tourist calls for his car in the morning, he simply passes the check over to the attendant; he does not have to look for the "man with the curly hair who was there last night," but won't be back till after dinner and then give the history of his case to someone else, as is the case in so many garages. If supplies have been ordered, everything has been attended to beforehand and a slip to present to the cashier is awaiting the tourist, unless he intends to stay for three or four days.

Methods Businesslike Throughout.

Incidentally, when you drive up to the King Edward Hotel and ask the head porter, "Where can I find a good garage?" he does not mince words but takes out a little book of blanks which are directed to Hyslop Bros. and signs it and sends you on your way. This is a real business-like method, and any idea that you may have that the porter is going to get a big, fat premium for sending you to the garage is dispelled when you enter Hyslop Bros.'s splendid building and witness an example of their excellent service.

KEEP MAILING LIST UP-TO-DATE.



Mailing lists should be kept up-to-date. It is both expensive and foolish to have a behind-the-times mailing list. Your mailing list is your list of prospective customers. Addresses should be absolutely correct, surnames correctly spelled and initials correct. Nobody likes to get mail with the name half wrong. Even if it is only a circular, it seems like carelessness or lack of interest on the part of the sender. Every change should be noted at once. Every employe in the office should be impresesd with the fact that you regard that list as wonderfully important. Then everyone will be keen to note and record changes of any kind. Look to your mailing list and keep it right.

APPLIES BOOKCASE IDEA TO CHARGING APPARATUS

Westinghouse Evolves an Ingenious and Practical Expansible System —One Set of Meters for All Batteries.

Apparently it is a far cry from a modern sectional bookcase to a charging equipment for electric vehicle batteries; but the likeness is striking in the case of a system that just has been placed on the market by the Westinghouse Electric & Mfg. Co., of East Pittsburgh, Pa., and which is well shown in the accompanying illustrations.

FRONT AND SIDE VIEWS OF WESTINGHOUSE "SECTIONAL" CHARGING PANEL AND GENERATING SET

A conspicuous advantage of this charging board is that a start can be made by installing equipment for charging as small a number of batteries as may be desired, and increases can be made from time to time, as conditions may demand, just as a sectional bookcase can be built up. That is to say, there is a top section of the charging board containing meters, lamps, switches and connections for charging two vehicles simultaneously. Additional sections, when required, are placed under the first, just as additional bookcase sections are placed under the cap-section. Additional sections, however, include only rheostats, switches and connections, the meters in the top section serving for all additions, being switched from one to another as occasion demands. The bottom section is similar to the top one in that it must be used even if there is only one charging pair, but is sufficient to handle the work entailed by the building up of the board to any reasonable height.

The outfit shown in the accompanying illustrations is sufficient to handle the charging of twelve batteries simultaneously, there being six sections and the top and bottom panels. If a board is built up as high as is desired, or as high as is possible, another may be built beside it and raised to the same height by using blank sections, to be replaced by active sections when they are needed. The two machines illustrated constitute a motor-generator set —that is to say, there is a motor driven by outside current and operating a generator which delivers current of the desired voltage; this is, of course, necessary only when the outside current supply is alternating, only direct current being available for battery charging. If the outside current supply is suitable, it may be connected direct to the charging board. If there is no outside supply of current, the electric motor can be replaced by any prime mover—gas, gasolene or steam engine.

And Now Here's the "Dogfish" Body.

What with "streamline" bodies, "submarine" bodies, "terraplane" bodies and too many others to mention, foreign builders must be just a little bit hard put to it to find expressive names for their creations, though little of the difficulty is apparent in the efforts of one French designer who has adopted the somewhat unenlightening designation "dogfish" body as best fitting his newest style. It is carefully explained, however, that the design has not been evolved to "make one more funny looking car; it would be one too many!" Instead, it is stated that the design is a logical development of the demand for the complete housing of everything possible. The body itself is of the orthodox pattern, except that the sides are carried clear out to the running boards, which thus are enclosed; the vertical space above the running boards is utilized to house the tool and battery boxes, trunks, etc., that go to make up part of the equipment. Two spare wheels can be accommodated in a bulbous back and the top when folded disappears completely in a pocket intended for the purpose. Washing the car, it is pointed out, is a comparatively simple matter, which would seem to be one of the principal advantages of the construction.

Price of "Gas" Low in West.

While on January 1st last the price of gasolene in the East was advanced one cent per gallon, and rumors are rife that it shortly may go from 17 to 19 cents, the price has been reduced 2½ cents per gallon on the Pacific Coast, where it is expected it soon will drop to 15 cents per gallon, retail. In that part of the country, it is stated that the area of what is termed "false valuation" is about past, as it has become known that the big oil companies for months have had an over-supply, due to the quality of oil which has been struck in the California fields, and also to competition of the Shell interests, who are importing gasolene from Sumatra. Previously, it was stated that the California oil was too heavy to produce gasolene, but discoveries in the Lost Hills, Belridge and Ventura districts have so changed the situation that the old excuses no longer rightfully can be brought to bear.

Removing Valve Cap with a Nut.

A valve cap of the type in which the wrench fits into a depression often may be removed, in the absence of a special wrench, by putting a nut, of the proper size and shape, into the depression, leaving enough projecting to afford a hold for an ordinary wrench. The nut need not be an exact fit, though it should be large enough so that there will be no danger of its turning and cutting away the faces in the valve cap.

REILLY FAMILY OFFENDED BY A CREDIT MAN

Which Causes Reilly to Deliver Himself of Opinions on Credit Systems That Drive Away Trade—The Sales Manager Also Cites an Unpleasant Experience and Contrasts It With Department Store Methods.

"Trying out a different make of tires?" asked the Sales Manager, as a motor de-

"IT IS BETTER THAN SOME PEOPLE'S CASH," RESPONDED REILLY

livery wagon stopped in front of the Reilly salesrooms and the driver rolled a set within doors, the mark upon the tires and the name upon the delivery wagon showing only too plainly that the shoes were not of the same brand as those which had carried Reilly's cars for a number of years.

"Not 'trying out' but 'going to use' sums up the situation," asserted Reilly with emphasis.

"What's the matter with the other brand? Didn't they give satisfaction?" queried the Sales Manager.

"Nothing whatever the matter with the tires; the matter's with me, I guess," replied the dealer.

Reilly Confesses to a Grievance.

"Well," added the Sales Manager, "what's the matter with you, over and above the half hundred things that always ail you? I suppose you're sore about something."

"You're right; I am sore," admitted Reilly.

"I know it," exulted the Sales Manager. "I'm getting so I can read you like a book. Now that you've partially confessed, come out with the rest of it. What's it all about?"

"Oh, I got sore because Mrs. Reilly got sore," blurted out the impulsive little man; "she didn't get just the right treatment from the tire house where we used to trade, so we quit them."

"What did they do?"

"Nothing much," said Reilly, "except that they almost insulted her the other day when she wanted to buy a tire. We had been driving our car on shoes which were getting pretty bad and, while she was out one day, one of the shoes blew out, so rather than run up here on the rim she drove to this tire company's branch, which was near where the blow-out occurred, and told them she wanted a new shoe.

When an Ironclad Rule Offended.

"The peculiar part of it is that I had bought a great many shoes there, but had always paid cash. I don't know why I did it, for I generally do more or less credit business as a matter of principle. Well, Mrs. Reilly and our chauffeur went in after the shoe, and the clerk who shoved it across the counter to the driver said, 'Thirty-four fifty.' Mrs. Reilly looked in her purse but didn't happen to have that amount of money with her, so she presented her card and showed the clerk one of mine and asked if the matter couldn't be taken up with me.

"The clerk said that the house rule was not to do a retail credit business. She said this might well come under the wholesale end, and practically insisted that it be charged to me as a dealer. The clerk meandered over to the bookkeeper and, of course, an investigation disclosed the fact that the company had never given me any credit. Then there was a conference with some sort of a credit man somewhere about the building, and the upshot of it was that they refused to let her have the tire. They explained that if President Taft or Napoleon Bonaparte or anyone else came along he couldn't be trusted for a tire, simply because it was an inflexible house rule."

"What did she do?" asked the Sales Manager.

Tactless Credit Work Loses Trade.

"What did she do?" exclaimed Reilly. "What could she do? She got red in the face and flounced out of that store in a hurry and drove up here on the flat tire and got one from my stock. And, believe me, her treatment made me as mad as she was—maybe madder. I called up the tire branch and asked them when my credit had grown so bad that it wasn't good for one tire. The salesman or manager or whoever I talked with tried to be as affable as he knew how; he explained that Mrs. Reilly was not known to them and that they never sold tires at retail on anything but a cash basis.

"I asked him if he didn't know I had

"MY CREDIT MUST BE AWFUL GOOD," SUGGESTED THE SALES MANAGER

bought several hundred dollars' worth of tires there since I had been in business and had paid cash with every order. He said he knew I had bought tires there. I asked then if he didn't think I was good for one tire on credit. He said he didn't know, that I never had been given credit by the branch, and that he couldn't very well charge that shoe. I asked him how long it would have taken him on the telephone to have found out whether Mrs. Reilly was Mrs. Reilly and whether I was good or not, and he hemmed and hawed and was still hemming and hawing when I hung up the receiver. For all I know, he's hemming and hawing yet.

Trying to Repair Needless Damage.

"One of their salesmen came in to see me several days afterward and tried to square the matter, but I wasn't in a mood that day to be squared; I told the salesman just how I felt and told him also that he was wasting time talking to me and that if his time was at all valuable he could utilize it elsewhere to better advantage."

"Some credit system in that branch, isn't it?" commented the factory man.

"That branch doesn't know what 'credit system' means," declared Reilly. "They use the term down there, but it's just like a parrot saying smart things; they are only using a term they have heard someone else use, but as to what it actually means in its full and valued sense they are in total ignorance. And the branch by no means has a monopoly on that class of ignorance.

Digitized by Google

"So few business men or business houses realize the value of a proper credit system or a proper credit man; too many credit men, or alleged credit men, develop an attitude of superiority and arrogance toward the public and conduct themselves as if extending credit were a favor to a customer and one for which the latter should be so thankful that he ought to get down on his knees and express his gratitude, and above all, that if he is refused credit he should consider himself as having deserved the refusal. You know, Jim, that a man whose credit is good can't help feeling offended when his credit is questioned."

Questioned Sales Manager's Credit.

"You're quite right there, Reilly," replied the Sales Manager. "I, myself, hold a sort of grudge against a carburetter branch up in our town to this day. I've tried to shake it, but I don't believe I ever will be able to as long as the present branch manager stays on the job."

"What did he do to you?"

"I wanted a new nozzle for the carburetter of my own car one day," explained the factory man, "and I sent the car down to the branch with one of the factory chauffeurs and told him to get the nozzle, find out how much it was, and tell the branch I would send the money down as soon as I knew how much to send. The chauffeur came back and told me the manager said he didn't know me and had never heard of me. He said he explained to the branch manager who I was and that the money would come right along, and, in fact, would have been sent down had I known the price of the nozzle—but there was nothing doing.

"I did just as you did; I telephoned to the branch and expressed a few opinions and didn't get much satisfaction. I asked the manager if he didn't think I was good for a nozzle that didn't cost more than a dollar or so. He still insisted that he did not know me and did not know whether I really had sent the chauffeur. I asked him if he couldn't have called me up and found out whether I was good. Then he said he wasn't allowed to do a credit business. I asked him if he couldn't have carried the amount on a slip of paper for a few hours, and he said, 'Not according to our rules.'"

Fallacy of the Inflexible Rule.

"There is no rule that is inflexible," asserted the dealer. "Cash business is all right, but exceptions must always be made. The biggest cash concerns in the country will carry an account for a day or two if they see the wisdom of it. Oftentimes a man whose credit is beyond question, as in your case, needs something badly and can't pay at once very conveniently, and in that case any sensible man will carry the charge on memorandum because it is practically a cash transaction and means the saving of a sale and the fostering of good will.

Making Full Use of the Telephone.

"Where is a cash house to draw the line? That's a matter of judgment, and, of course, it's a difficult one at times, but it ought not to trouble a thinking man. Every business man knows whom he can trust, and if he doesn't know, it won't take long to find out. The handiness of telephones makes excuses for not finding out unreasonable. If a man comes into a store nad wants credit and he is not known he is perfectly willing to wait until the credit man can call up whatever references the customer gives. And if the customer is fortified with letters and cards there is seldom a chance of going wrong."

"But supposing a credit man should be buncoed?" suggested the Sales Manager.

"He has to take a chance, that's all," answered Reilly. "There isn't a merchant or business man of any kind who isn't always taking chances. A clever crook could get possession of letters and cards and give a reference which would be found good over the 'phone and get away with a small amount of goods, but the chance is so small that the wise credit man is willing to risk making a mistake if he is fairly sure he is right.

"Also, tact is a quality which many credit men are sadly in need of. That carburetter man who turned you down could just as well have explained to the chauffeur that he didn't do a credit business, instead of telling the chauffeur he questioned your credit. He probably was one of these exalted financiers who never got into the domain of common sense because he couldn't get through the door, it is so small.

Advantage of Not Paying Cash.

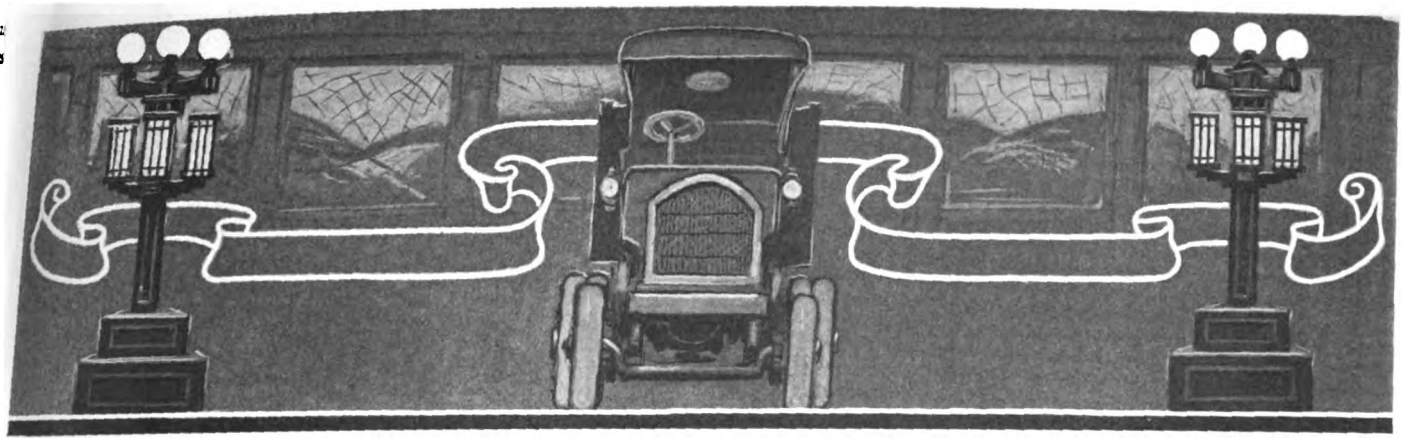
"But the solution of the whole problem with me has resolved itself into a determination not to pay cash for anything where there is any possibility that I will ever need credit. You can pay cash all your life and buy thousands of dollars worth of goods, and maybe when you happen to want credit for a few days you are turned down, for the simple reason that you never have had credit. I buy practically everything on credit now, but I discount my bills, and that tells the story. My wife used to have a holy horror of bills and didn't want to run accounts at the stores, but I insisted upon it. Until we started accounts we didn't have any credit, although our credit really was as good then as it is now. In fact, I never thoroughly realized what it meant until I heard a pretty shrewd business man remark that a customer who always pays spot cash is never fully appreciated—that a firm never knows a customer nor realizes the volume or value of his patronage unless it appears in black and white on the firm's books and is totaled at the end of the year. He said he himself never paid cash for his purchases, for that reason and for no other."

"My credit must be awful good, if the letters I get from department stores are any criterion," remarked the Sales Manager. "I get a grist of them inviting me to open accounts or telling me that an account has been opened for me without my asking for it."

Department Stores as a Pattern.

"They surely are a criterion," stated Reilly, "and also are an evidence of wide-awake credit methods in the modern department stores. The stores have looked you up thoroughly and they know you're good. They also have discovered that you have no account with them. They also know that you are quite likely to trade where you have an account, and the answer is simple—they are trying to get your name on their books. Your credit to them is better than some people's cash.

"Those credit men, too, have gotten over that old-time idea that credit is something to be fought shy of. The efficient, up-to-date merchant discriminates; he shakes off the bad credits and works like a nailer to get the good ones. He also reverses the situation and makes you think he is the one who is favored if you open an account. And tact! These darned department store credit men are so tactful that you feel like falling over yourself to pay your bills."



The telephone rang, and after the Sales Manager had listened to a one-sided conversation Reilly explained that it was the branch from which the tires had just come asking if everything was all right.

"I told him to send a bill and I'd send a check," added Reilly, "but he didn't seem worried about it. He said he guessed I was good, and you can bet your hat that while he said he 'guessed' his guess is based upon an investigation. That chap knows his business."

When Hunting is Doubtful Sport.

Opinions differ as to what constitutes sport; according to various viewpoints it may be anything from hunting tigers on foot to racing snails on a shingle. There are not many, however, who will class the latest amusement of a Western car owner as sport. His plan is to sit on a saddle placed on the hood of a car, armed with a gun, and be driven along the road on a dark night with the headlights burning full force. Rabbits, blinded by the glare, stand still in the road until the "sportsman" gets near enough to pot them.

THE TRUCKS IN THE "STAINED GLASS" SETTING

Surprises That Were Expected and Some That Were Not—Chicago-Built Machines Not Shown in New York Form Strong Contingent—Standard Construction Embodied in Most of the Trucks Displayed.

Whether that dear Coliseum really is much like a Cathedral or not—or ever could be made to look much like anything except its steel-boned self—is entirely immaterial. The fact remains that this here, now, S. Miles, what gets up these automobile shows, y'understand, has worked out something that a name can be tacked onto, and however loosely the appellation may fit, it is a whole lot better than describing it as something indescribable and letting it go at that. Now, last time there was an automobile show in Chicago—but what's the use.

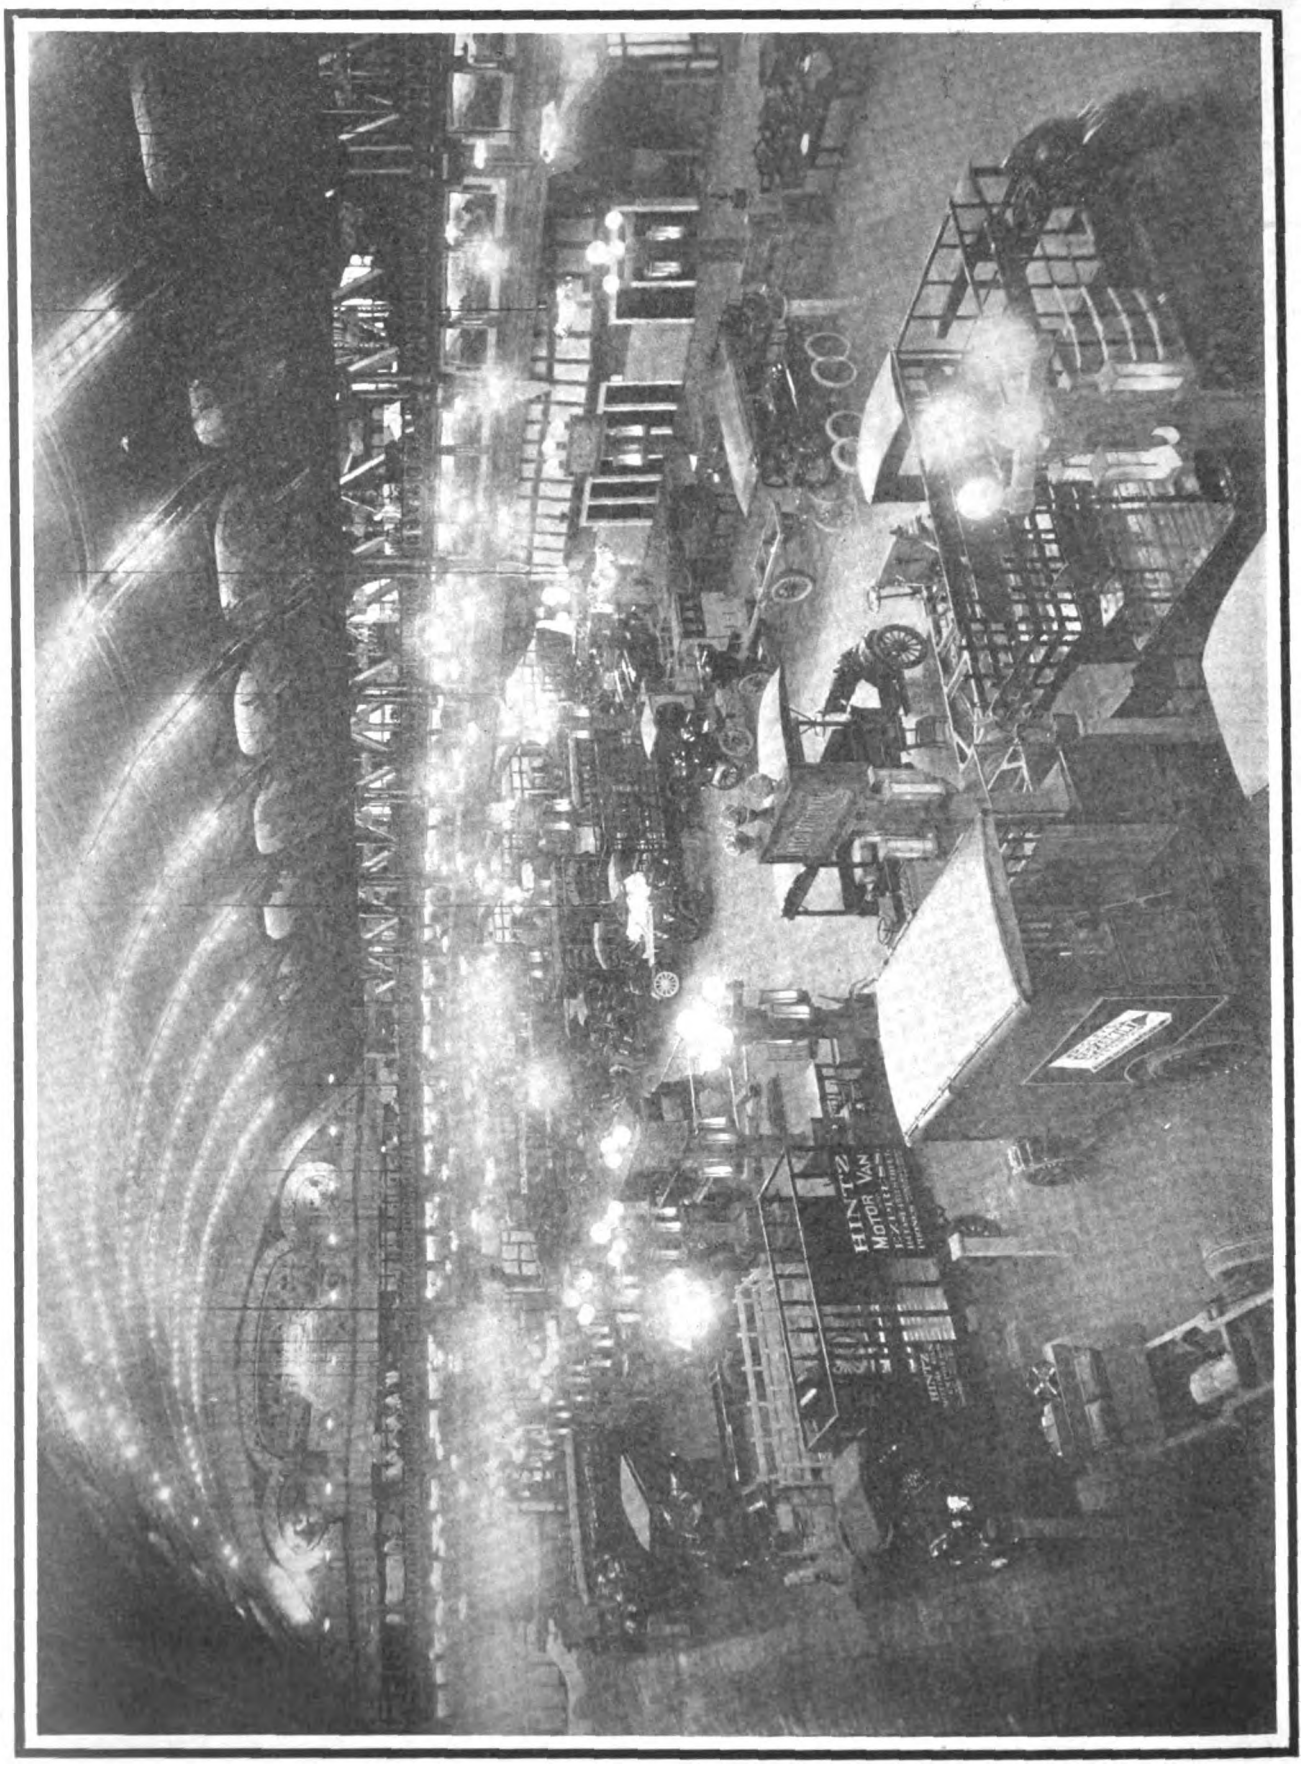
Same Setting Remains for Trucks.

It's enough to say that the host of trucks basks under the same "stained glass effects" as did the pleasure cars; the same nude and, therefore—if for no other reason—highly artistic figures gaze down on the machines; the same centaur wonders—or ought to—what the dickens he is doing there and fails to discern anything familiar to his classic eye except the name on the Mercury and Vulcan trucks; and over all there is the same dim, religious light. That is to say, that's what it looks like. According to the expert testimony of the photographers, the light is emphatically not religious, however dim it may be.

The Chicago truck show has confirmed the growing suspicion that it isn't really necessary to swing wide the portals—that's one that hasn't been overworked—upon an incomplete exhibition. All the machines were in place, and all looked as if they had had plenty of time to get there. Thankfully, the first-night crowd observed that there was plenty of elbow-room, even as there was at the truck show in New York. In the accessories departments there was more than elbow-room, for there were many exhibitors of the many things that go to make and equip a complete car who decamped, leaving behind them emptiness. In other words, the accessories exhibits were thinned out nearly half. Of course, this is rather to be expected, for there are hosts of things that the pleasure car people must have, or ought to have, or think they ought to have, that the truck people can very well get along without.

The business of prognostication is one of the most disconcerting that exists, in some ways. For instance, according to all the preliminary dope, there ought to have been just an even score of cars shown at Chicago that were not shown in New York. Come to look over the show itself and, behold! there are three too many, despite the fact that two of the original score failed to stand up when their names were called—the Reliance and the Ware. But five others—namely, Harvey, Hercules, Moon, Moore and Sampson—put in a more or less unexpected appearance and a good deal more than evened the score, so to speak. The Sampson, of course, is an old and sturdy friend, and its solidity and strength are, as they always have been, in keeping with its name.

New Truck With Two-Cycle Motor.

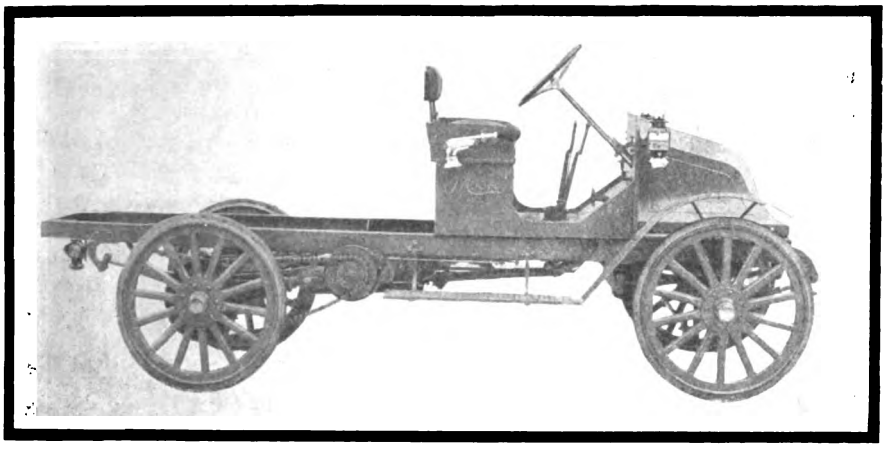


The Moore is a new machine of 1,600 pounds carrying capacity manufactured by the Palmer-Moore Co., of Syracuse, N. Y., and its chief feature of interest is its motor. This is the Palmer-Moore two-cycle, described in Motor World when it first appeared nearly a year ago, in which it is sought to combine the slow-running qualities of a motor with small ports with the speed and power of a large-ported motor. There are shutters in the intake and exhaust ports which are under the control of the driver; the motor is throttled by partly closing the shutters and speeded up by opening them, the speed regulation thus being removed from the carburetter altogether. The motor has three air-cooled cylinders of 4 inches bore and 4 inches stroke and is rated at 20 horsepower. Apart from the motor, the truck is built along familiar lines, having a two-speed planetary gearset and side chain drive to the rear wheels. The wheelbase is 102 inches and the wheels, which are 36 inches in diameter, are fitted with solid tires.

Moon and Harvey Enter the Field.

The name Moon is well enough known in connection with pleasure cars, but this is the first time the Moon people have exhibited a truck; there's a new Moon just rising, so to speak. The machine is anything but radical; it follows accepted lines, having a four-cylinder L-head motor driving through a three-speed selectively controlled gearset to the live rear axle. The rated carrying capacity is a ton and a half. A standard body of the express type, with canopy top, is mounted.

Another debutante—if the name doesn't fit, don't use it—is the Harvey, built by the Harvey Motor Truck Works and hailing from Harvey, Ill. Like the Moon, the Harvey truck is made in a single size, of a ton and a half capacity, and the same description applies, in a general way, as far as the rear end of the gearcase—that is, there is a



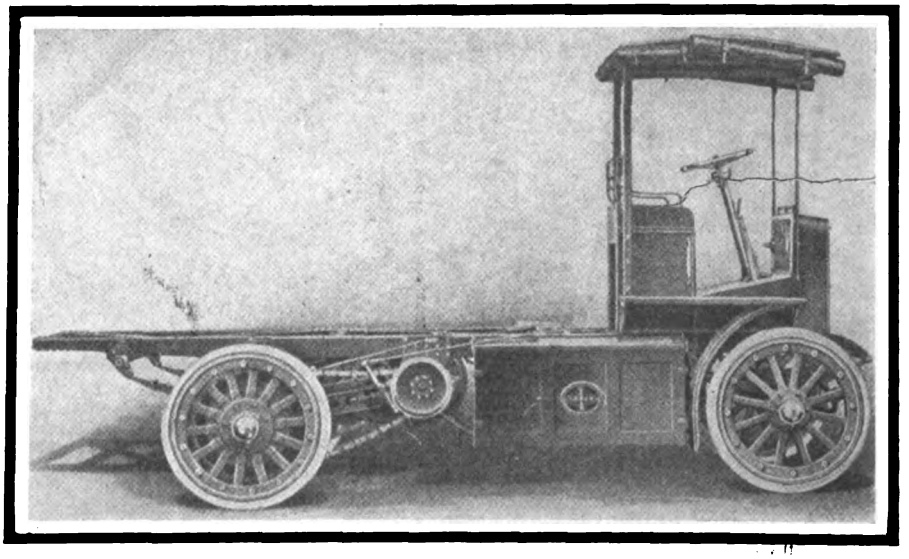
Digitized by Google

GENERAL VIEW OF THAT PORTION OF CHICAGO'S TRUCK SHOW WHICH IS HOUSED IN THE COLISEUM

Digitized by Google

four-cylinder L-head motor and three-speed selectively controlled gearset; but in the Harvey final drive is by side chains. Only a chassis is exhibited. While not a few manufacturers of heavy trucks have adopted cast steel wheels, their advantages for lighter machines have not been so readily discerned; the Harvey people, however, have cast their vote boldly for the die-

PALMER-MOORE CHASSIS WHICH EMPLOYS 3-CYLINDER 2-CYCLE MOTOR



cast steel wheels they fit to their trucks, and claim for them all the advantages possessed by wood wheels and, in addition, strength in those points in which the wood wheel is comparatively weak.

Eight "Built In Chicago" Vehicles.

Chicago-built trucks loom up strongly among the "Chicago exclusively" exhibits—or, rather, the exhibits shown in Chicago but not in New York. No less than eight cars claim Chicago as their native soil and seem none the worse for it—Clark, Diamond T, Harder, Little Giant, Mogul, Old Reliable, Walker, and Mercury. So far as size is concerned, the Mogul is the most conspicuous of the group; there are shown two great six-tonners which differ only in the matter of wheelbase. The constructional details show nothing unusual; standard features are employed throughout. The motor, of the T-head type, and the three-speed selective gearset are substantial and well adapted to their work, but without departure from current practice. Final drive is by side chains. The longer chassis is fitted with a special lumber body, a feature of which is the crank-operated roller system, by which one man can unload the whole cargo. The tires, however, are even more unusual than the body, in their own way. They consist of rubber cushions, which, as usual, absorb jar and vibration, and a series of steel blocks, forming a tread which resists wear by reason of its hardness and has many sharp edges which, should there be a tendency to skid, grip the road and hold the truck in line.

Walker trucks, which are electrics with internal gear drive enclosed in the rear wheels, while the motor is encased in the hollow rear axle, are distinctive because of their peculiarities as well as their faculty of standing up and doing their work; like most machines of unusual construction, they are no strangers to showgoers. Suffice it to say that they have not been altered, except in minor details.

While worm drive is not the novelty it was a short time ago, it still is new enough to call special attention to any machine in which it is employed, and for this reason, if for no other, the Diamond T is conspicuous; not that this is its only claim to distinction, for it is not; it is, however, the one that stands out most from the multitude. The worm has been applied to a machine having a carrying capacity of 1½ tons, which is exhibited, and also to a 3-ton model, which is not at the show. The 1½-ton worm driven car has a block-cast motor with fixed ignition point and enclosed valve mechanism. The three-speed gearset is a unit with the motor and is selectively controlled by a center lever; the steering wheel, however, is on the right side. A five-ton truck also is shown, having its motor and gearset in separate units and final drive by side chains.

SIDE VIEW OF THE URBAN ELECTRIC TRUCK CHASSIS

Examples of "Driver Proof" Construction.

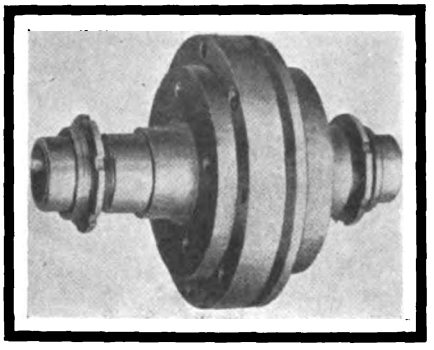
The mechanical shortcomings of the men who usually are selected to drive delivery wagons have been given their full meed of consideration in the working out of the Clark delivery cars. For instance, the block-cast motors have ignition by automatically advanced Eisemann magneto, and the gearsets are of the individual clutch type; the gears always are in mesh, and there is no chance for the driver to strip them bare of teeth. Final drive is by shaft in all cases. Motor position varies in different models, being under the seat in some and under the usual forward hood in others; the two cylinder horizontal motor that was employed in previous models has been discontinued.

The Chicago Pneumatic Tool Co. has added two members to its family of Little Giants. One is brand new, having a four-cylinder motor and three-speed selective gearset, in which it differs from others of the tribe, which have horizontal motors of the two-cylinder opposed type. One of the two-cylinder models has a planetary gearset and another a sliding gear similar to that on the four-cylinder car. The control is of the interlocking type, so that the clutch must be disengaged before the gears can be shifted—another case where the mechanical shortcomings of otherwise perfectly good delivery wagon drivers have been considered to some purpose.

"One of those little fellows with the high wheels" just about places the Mercury—one of those busy, useful, simple, all-round wagons that find such favor for light delivery work. But a single model is built—a

Digitized by Google

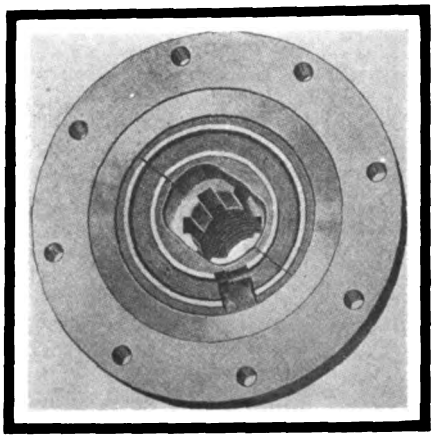
light delivery with horizontal opposed cylinder motor, air-cooled, placed crosswise under the body. With this power plant, a planetary transmission and side chain drive, combined with light weight, the machine is well able to take care of itself under conditions that make things mighty hard for some of the heaviest trucks.



Once again—standard construction; this time it is the Harder truck, which is shown in two models—3-ton and 5-ton—both with four-cylinder T-head motors, three-speed selective gearsets and final drive by good, stout side chains. The under-the-seat position has been adopted for the power plant, owing to the fact that the chassis length can be kept down without encroaching upon the space required for loading purposes. Whether through hard luck or Harder luck, a fine piece of fire department apparatus that was intended for the show was delayed in the shops and so could not be exhibited; but while the exhibit was deprived of a spectacular feature, the machines that were there appeared to be fully able to stand on their own merits.

Drives Through All Four Wheels.

All ideas of standard construction are thrown to the winds in the case of the Four-Wheel Drive truck, which is shown for the first time—that is to say, there is nothing standard in the general design of the machine, and few of the component parts are of familiar type. The machine is just what its name indicates; both axles are driven through shafts and bevel gears. The motor, of the T-head type, drives in the usual way to a gearset, in which the gears always are in mesh, the different speeds being engaged by means of individual friction clutches. From the final shaft of the gearset the drive is through a "silent" chain, enclosed in a tight casing, to a differential on a longitudinal shaft the opposite ends of which carry the bevel pinions driving to the live front and rear axles. Specially constructed universal points on the live shafts of the front axle permit steering and driving simultaneously, the rear wheels not being employed in steering.



These trucks are built in two capacities—1,500 pounds and 3 tons—the constructional features being alike in both, though the heavier car has a differential lock on the master differential—the one on the longitudinal shaft—which gives a rigid drive to both axles. The service brakes are a pair of bands and drums on the master differential, there being one on each side, accurately equalized, while a pair of drums and bands on the rear wheels constitute the emergency brake equipment. A feature that is in keeping with the four-wheel drive idea is that the weight distribution is very even, there being only 10 per cent. more weight on the rear wheels than is carried on the front.

A bold departure from commonly accepted practice, in a constructional detail, is found in the Wayne gearless differential in the rear axle of the Ideal truck. In the casing usually occupied by the gears of the conventional differential is a pair of friction clutches actuated by cams. The effect

IDEAL GEARLESS DIFFERENTIAL

of the driving power is to throw the cams slightly and expand and engage the friction clutches; if, however, one wheel moves faster than the other, as does the outer wheel on a curve, the clutch of the faster moving wheel shaft will become disengaged, allowing the wheel to run free while the slower moving wheel takes the drive. As

IDEAL DIFFERENTIAL MECHANISM

long as both move together the driving power is equally distributed.

Advantages of Gearless Differential.

Several interesting advantages accrue from this arrangement. It is not possible to spin one wheel while the other stands, for if both wheels cannot drive, the slowest moving wheel must take the drive; thus, a wheel with a deflated tire will revolve a little faster than its mate with a full tire, and can take no driving strain; the driving action on a slippery road is the same as if there was a differential lock and an ordinary differential; a car can be driven with a live axle shaft removed; and so on.

But the Ideal cars have other things besides Wayne differentials. There are two models, of 1 ton and 2 tons capacity, respectively, with four-cylinder, L-head motors, three-speed selective gearsets and final drive by side chains, the differentials being of course on the jackshafts.

A very close approximation to a straight-line drive is obtained in the case of the Poyer company's Menominee trucks by the use of a peculiar drive from the gearset to the propeller shaft. Instead of driving direct from the tailshaft of the gearset to the propeller shaft, there is a pinion on the tailshaft which drives a gear located directly under it, and the shaft that carries the gear drives the propeller shaft. The net result is that the propeller shaft starts from a position several inches lower than the tailshaft, and yet the motor, which is built as a unit with the gearset, can be carried plenty high enough to give accessibility.

Preaching and Practicing Long Stroke.

The doctrine of long stroke for commercial work is one that is believed, preached and practiced by the manufacturers of the Natco truck, for they equip their machine with a motor having a bore of 3½ inches and a stroke of 5 inches, rating at 27 horsepower. Up-to-date practice is embodied in the engine, which has block-cast cylinders, enclosed valve mechanism and the intake pipe arranged to pass through the opening that is left between the second and third cylinders below the water jackets; this arrangement has the advantage of warming the gas and facilitating vaporization. The motor is cooled by gravity-circulated water.

A practice that is growing in favor is adopted in the Natco; that is, the motor is placed under the footboards with the cylinders projecting upward into a low hood which divides the floor into two parts. The radiator is in the place usually occupied by the dashboard. Transmission of power is through a leather-faced cone clutch, three-speed selective gearset and side chains to the rear wheels. But one model is built, the carrying capacity being one ton.

One of the surprises of the show is the variety of machines exhibited by the Avery people, whose farm tractor is a well-known machine in agricultural districts. No less than four new models are shown, and while two of them, the 3-ton and 5-ton trucks, were made public in January, a 1-ton machine built along European lines and a two-tonner with motor under the seat and floor are just out of the box. Both machines have four-cylinder block-cast motors, three-speed selectively controlled gearsets and side chain final drive, and are equipped with left steer and center control; in fact, apart from motor position and such matters as size and weight, the machines are practically alike.

Digitized by Google

The 3-ton and 5-ton models have motors under the seats; the three-tonner has the same individual-cylinder motor as the tractor, while the five-tonner has a new motor with pair-cast cylinders and exhaust valves in the cylinder heads and intakes in side pockets. The 2-ton farm tractor has been discontinued, and the 3-ton tractor, which is retained, has 40- and 42-inch wheels with wood plug tires.

Motors That Are Accessible.

A type of truck that is gaining in popularity because of its obvious advantages in the way of accessibility and simplicity is that in which the engine is placed under a sloping hood with the radiator behind it—originally a French design. To this class belongs the Adams, which is represented by a 1-ton and a 2-ton machine, a 3,000-pound model being absent. The motors in all the Adams models have four cylinders and drive through selectively controlled gearsets; left steer and center control are standard.

The Adams block-cast motor is a particularly interesting piece of engineering, owing to the fact that the oil pump, water pump and magneto all are driven from a worm-driven transverse shaft at the front of the crankcase. The open-front design permits easy access to this group. The motor is of the moderately long-stroke type, the bore being 3⅞ inches and the stroke 5 inches.

Also left-steered and center-controlled, the United States trucks add individuality by the use of gearsets of individual clutch type, these being characteristic features of both the two-ton and the three-ton models shown. The motors have L-heads and enclosed valve systems and are carried in front, under hoods; final drive is by countershaft and side chains.

Friction Drive and Electricity.

Proof positive that the friction drive principle will not down—in fact, its adherents say that its specialty is going up—is furnished by the little 1,000-pound Commerce wagon and a slightly heavier model designed to carry 1,250 pounds. The two models are much alike, having four-cylinder motors, no clutches, of course, and final drive through side chains. The heavier machine has a somewhat more powerful motor than the lighter.

Though built according to standard ideas in almost every other respect, one of the Old Reliable trucks has a touch of individuality in its braking system. On the 4-ton model the countershaft brake is the Kline, in which the brake is actuated through an eccentric instead of the more usual toggles. The theory is that the pull of the brake is not felt by the operator, who finds it just as easy to hold the brake "on" as to apply it in the first place. Two Old Reliables are shown—a 2-ton and a 4-ton.

Menominee trucks are exhibited in three models having carrying capacities of 1,500 pounds, 1 ton and 1½ tons, respectively. Motors are under a forward hood. The steering wheels are placed on the right side and the gear-shifting and emergency brake levers are in the center of the footboard.

There are two "exclusive" electrics in addition to the Walker balance drive machine—the Buffalo electric and the Urban. These two machines are excellent examples of two different power transmission systems. The Buffalo employs a heavy-duty slow-speed motor which drives direct to the live rear axle through propeller shaft, which is innocent of universal joints, and bevel gears; the shaft is practically horizontal when the truck is under load, and in this condition the weight of the motor is all taken by the hangers. In the case of the Urban—the product of the Kentucky Wagon Co., of Louisville, Ky.—the motor shaft carries a sprocket over which runs a "silent" chain driving a countershaft which, in turn, drives to the rear wheels through sprockets and roller chains.

URBAN ELECTRIC CONTROL ELEMENTS

Controller and emergency brake levers on the Urban electric are similar to the levers of a gasolene car and are centrally located, as in many gas machines; in fact, the battery is about the only thing that betrays the electric propelling power when the car is viewed from a little distance.

The Buffalo electrics are built to carry 1,500 pounds. The Urban line includes machines carrying 1,000 pounds, 1 ton, 1½ tons and 2 tons, only the largest and smallest being exhibited.

As for the rest of the trucks shown at Chicago, they all were shown in New York and have been fully covered in Motor World and, while they have lost nothing in being tranpsorted from New York to Chicago, they have acquired no new features that cannot be accounted for by the flicker of the "cathedral lights."

The full list of truck exhibitors is as follows, the asterisk (*) denoting exhibitors who were not at New York.

Adams Bros., Findlay, Ohio—Adams. Gasolene, 1 and 1½ tons; prices, $2,100 and $2,300.*

American Locomotive Co., New York—Alco. Gasolene, 2 to 6½ tons; prices, $2,950 to $5,200.

Autocar Co., Ardmore, Pa.—Autocar. Gasolene, 3,000 pounds; price, $2,150.

Avery Co., Peoria, Ill.—Avery. Gasolene, 2, 3 and 5 tons; prices, $2,700 to $4,500.*

Baker Motor Vehicle Co., Cleveland, Ohio—Baker. Electric, 500 pounds to 4 tons; prices, $1,800 to $3,500.

Bessemer Motor Truck Co., Grove City, Pa.—Bessemer. Gasolene, 1,000 to 3,000 pounds; prices, $1,200 to $2,700.

Blair Mfg. Co., Newark, N. J.—Blair. Gasolene, 1½ to 3½ tons; prices, $3,000 to $3,750.

Bowling Green Motor Car Co., Bowling Green, Ohio—Modern. Gasolene, 1,000 to 2,000 pounds; prices, $1,200 to $1,600.

Brown Commercial Car Co., Peru, Ind.—Brown. Gasolene, 500 pounds; price, $1,650.

Buick Motor Co., Flint, Mich.—Buick gasolene, 1,000 pounds capacity; price range, $975 to $1,100.

Buffalo Electric Vehicle Co., Buffalo, N. Y.—Buffalo Electric.*

Chase Motor Truck Co., Syracuse, N. Y.—Chase. Gasolene, 500 pounds to 2 tons; prices, $500 to $2,200.

Clark Delivery Car Co., Chicago, Ill.—Clark. Gasolene, 1 ton; price, $2,000.*

Chicago Pneumatic Tool Co., Chicago, Ill.—Little Giant. Gasolene, 1 ton; price, $1,100.*

Commerce Motor Car Co., Detroit, Mich.—Commerce. Gasolene, 1,000 pounds; price, $700.*

Dart Mfg. Co., Waterloo, Ia.—Dart. Gasolene, 750 to 3,000 pounds; prices, $750 to $1,790.

Diamond T Motor Car Co., Chicago, Ill.—Diamond T. Gasolene, 1½, 3 and 5 tons; prices, from $2,250 to $3,500.*

Dayton Auto Truck Co., Dayton, Ohio—Dayton. Gasolene, 2, 3 and 5 tons; prices, $2,600 to $4,500.*

Driggs-Seabury Ordnance Corp., Sharon, Pa.—Vulcan. Gasolene, 4½ to 7 tons capacity; price range, $3,600 to $5,600.

Durant Dort Carriage Co., Flint, Mich.—Flint. Gasolene, 1,000 and 1,600 pounds; price of 1,000 pound, $875.

Federal Motor Truck Co., Detroit, Mich.—Federal. Gasolene, 1 ton; price, $1,800.

Digitized by Google

Four Wheel Drive Auto Co., Clintonville, Wis.—Four Wheel Drive. Gasolene.*

Garford Co., Elyria, Ohio—Garford. Gasolene, 1½ to 5 tons.

General Motors Truck Co., Pontiac, Mich.—G M C. Electric and gasolene, electric 1,000 pounds to 6 tons and gasolene 1¼ to 5 tons.

General Vehicle Co., Long Island City, N. Y.—General Vehicle. Electric, 750 pounds to 5 tons.

Gramm Motor Truck Co., Lima, Ohio—Gramm. Gasolene. Willys, gasolene; capacity, 1,500 pounds; price, $1,250.

Gramm-Bernstein Co., Lima, Ohio—B. A. Gramm. Gasolene, 2 to 3½ tons; prices, $2,750 to $3,600.

Harder Auto Truck Co., Chicago, Ill.—Harder. Gasolene.*

Harwood-Barley Mfg. Co., Marion, Ind.—Indiana. Gasolene, 1½ tons; price, $2,000.*

Harvey Motor Truck Works, Harvey, Ill.—Harvey. Gasolene, 1½ tons capacity.

Hewitt Motor Co., New York—Hewitt. Gasolene, 1 to 10 tons; prices, $1,800 to $5,500.

Hupp Motor Car Co., Detroit, Mich.—Hupmobile. Gasolene, 800 pounds; price, $950.

Ideal Automobile Co., Ft. Wayne, Ind.—Ideal. Gasolene, ¾, 1, 1½ and 2 tons; prices from $1,500 to $2,250 .

International Harvester Co., Chicago, Ill.—I. H. C. Gasolene, 1,000 pounds.

Jeffery Co., Thos. B., Kenosha, Wis.—Rambler. Gasolene.*

Kelly Motor Truck Co., Springfield, Ohio—Kelly-Springfield. Gasolene, 1 to 3 tons; prices, $2,000 and up.

Kentucky Wagon Mfg. Co., Louisville, Ky.—Urban. Electric, 1,000 pounds; price, $1,800.*

Kissel Motor Car Co., Hartford, Wis.—Kissel. Gasolene, 1,500 pounds to 5 tons; prices, $1,500 to $4,350.

Knox Automobile Co., Springfield, Mass.—Knox. Gasolene, 2 to 6 tons; prices, $2,750 to $5,000.

Koehler S. G. Co., H. J., New York—Koehler. Gasolene, 1,600 pounds; price, $750.

Krebs Commercial Car Co., Clyde, Ohio—Krebs. Gasolene, 1,500 pounds; price, $1,375.

Lauth-Juergens Motor Car Co., Fremont, Ohio—Lauth-Juergens. Gasolene, 1 to 3 tons; prices, $1,950 to $3,300.

Lippard-Stewart Motor Car Co., Buffalo, N. Y.—Lippard-Stewart. Gasolene, 1,500 pounds; price, $1,650.

Locomobile Co. of America, Bridgeport, Conn.—Locomobile. Gasolene, 5 tons; price, $4,800.

Lansden Co., Newark, N. J.—Lansden. Electric, 750 pounds to 5 tons.

Mack Bros. Motor Car Co., Allentown, Pa.—Mack. Gasolene, 1 to 7 tons; prices, $2,100 and up.

Mais Motor Truck Co., Indianapolis, Ind.—Mais. Gasolene, 1½ to 3 tons; prices, $2,750 to $3,400.

Maxwell Motor Co., Tarrytown, N. Y.—Sampson. Gasolene.

Mogul Motor Truck Co., Chicago, Ill.—Mogul. Gasolene, 2, 4 and 6 tons; prices, $2,800 to $4,700.*

Moon Motor Car Co., St. Louis, Mo.—Moon. Gasolene.

Mercury Mfg. Co., Chicago, Ill.—Mercury. Gasolene, 1,000 pounds; price, $750.*

National Motor Truck Co., Bay City, Mich.—Natco. Gasolene, 1 ton.*

Old Reliable Motor Truck Co., Chicago, Ill.—Old Reliable. Gasolene, 2, 4 and 5 tons; prices from $2,750 to $4,500.*

Packard Motor Car Co., Detroit, Mich.—Packard. Gasolene, 2 to 5 tons; prices, $2,800 to $4,500.

Palmer-Moore Co., Syracuse, N. Y.—Moore. Gasolene; 1,600 pounds capacity; price, $1,300.

Peerless Motor Car Co., Cleveland, Ohio—Peerless. Gasolene, 3 to 5 tons; prices, $3,700 to $4,500.

Poyer & Co., D. F., Menominee, Mich.—Menominee. Gasolene.*

Pierce-Arrow Motor Car Co., Buffalo, N. Y.—Pierce-Arrow. Gasolene, 5 tons; price, $4,500.

Pope Mfg. Co., Hartford, Conn.—Pope-Hartford. Gasolene, 3 to 5 tons; prices, $3,350 to $4,475.

Reliance Motor Truck Co., Pontiac, Mich.—Reliance. Gasolene.*

Reo Motor Car Co., Lansing, Mich.—Reo. Gasolene, 1,500 pounds to 2 tons; prices, $760 to $1,800.

Sanford Motor Truck Co., Syracuse, N. Y.—Sanford. Gasolene, 1 ton; price, $1,600.

Saurer Motor Co., New York—Saurer. Gasolene, 4½ to 6 tons.

Schacht Motor Car Co., Cincinnati, Ohio—Schacht. Gasolene, 1,500 pounds to 4 tons; prices, $1,600 to $3,300.

Selden Motor Vehicle Co., Rochester, N. Y.—Selden. Gasolene, 1 ton; price, $2,000.

Service Motor Car Co., Wabash, Ind.—Service. Gasolene, 1,500 pounds to 1½ tons; prices, $1,350 to $1,675.

Smith Co., A. O., Milwaukee, Wis.—Smith-Milwaukee. Gasolene, 3½ to 6 tons.

Speedwell Motor Car Co., Dayton, Ohio—Speedwell. Gasolene, 2 to 6 tons; prices, $3,750 to $4,400.

Standard Motor Truck Co., Detroit, Mich.—Standard. Gasolene, 3 tons; price, $2,750.

Sternberg Mfg. Co., Milwaukee, Wis.—Sternberg. Gasolene, 2 to 5 tons; prices, $2,800 to $4,500.

Stewart Motor Corp., Buffalo, N. Y.—Stewart. Gasolene, 1,500 pounds; price, $1,650.

Studebaker Corp., Detroit, Mich.—Studebaker. Electric and gasolene; electric, 500 pounds to 5 tons; gasolene, 800 pounds to 5 tons.

United States Motor Truck Co., Cincinnati, Ohio—United States. Gasolene, 2 and 3 tons; prices, $2,800 and $3,500.*

Universal Motor Truck Co., Detroit, Mich.—Universal. Gasolene, 1 to 3 tons; prices, $2,750 to $3,400.

Velie Motor Vehicle Co., Moline, Ill.—Velie. Gasolene, 1,500 pounds to 3 tons; prices, $1,600 to $3,350.

Walker Vehicle Co., Chicago, Ill.—Walker. Electric, ½ to 3½ tons.*

Ware Motor Vehicle Co., St. Paul, Minn.—Ware.*

Waverley Co., Indianapolis, Ind.—Waverley. Electric, 600 pounds to 5 tons; prices, $1,800 to $4,000.

White Co., Cleveland, Ohio—White. Gasolene, 1,500 pounds to 5 tons; prices, $2,100 to $4,500.

Weston-Mott Co., Flint, Mich.—Axles and parts.

Westinghouse Electric & Mfg. Co., Pittsburg, Pa.—Motors, starting and lighting outfits, vulcanizers, horns, etc.

Wheeler & Schebler, Indianapolis, Ind.—Schebler carburetters.

Whitney Mfg. Co., Hartford, Conn.—Whitney chains.

Willard Storage Battery Co., Cleveland, Ohio—LBA storage batteries.

Williams Co., J. H., Brooklyn, N. Y.—Drop forgings and wrenches.

Wolverine Lubricants Co., New York City—Wolverine lubricants.

Krit Branch Takes Over Four States.

The Krit Motor Car Co., of Detroit, has opened a branch in Kansas City, which will be in charge of G. H. Cairns, who previously was connected with the Krit factory in Detroit. The branch, which will handle the States of Kansas, Missouri, Oklahoma and Colorado, will be located on the premises of the Bond Motor Co., at 1615 Grand avenue, which previously handled the territory and which will continue to represent the Krit car in Kansas City itself.

Fisk Locates a Branch in Iowa.

The Fisk Rubber Co. has located a factory branch and service station in Des Moines, Ia., at 711 Locust street. It is in charge of P. J. Kennedy, who obtained the necessary experience in the Fisk factory at Chicopee Falls, Mass.

U. S. Tire Locates Two Branches.

The United States Tire Co. has established branches in Salt Lake City, Utah, and Grand Rapids, Mich. The former is in charge of Sidney Theobold and the latter under the direction of C. L. Sowers.

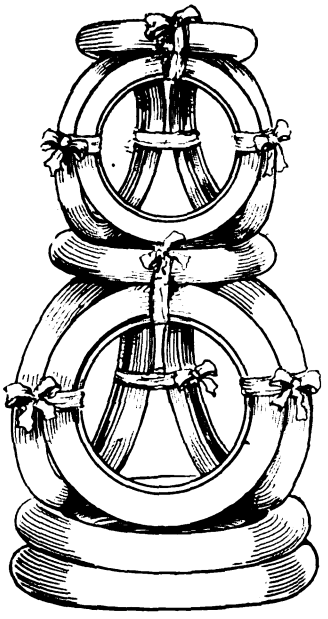
FIXTURES AS AN AID TO EFFECTIVE DISPLAY

How "Keeping" Merchandise May Be Turned Into Selling It With the Aid of Simple Devices—Some of the Fixtures Employed by Tire Makers—Fallacy of the Dusty Shelf Principle.

"Goods well displayed are half sold" is a selling maxim, or axiom, that has done duty for more than a day. Probably the beads and the $24 that bought Manhattan Island were well displayed—in fact, almost from the day of the famous ark to the day of the automobile, which is quite a long stretch, merchandising of practically every kind has required some sort of a display of the wares to be disposed of.

Adequate Display Is Essential.

Modern merchandising, which is quite a little different from ancient merchandising—"sight unseen" or otherwise—not only requires display, it demands display. And of all merchandising, the selling of automobiles and automobile accessories probably

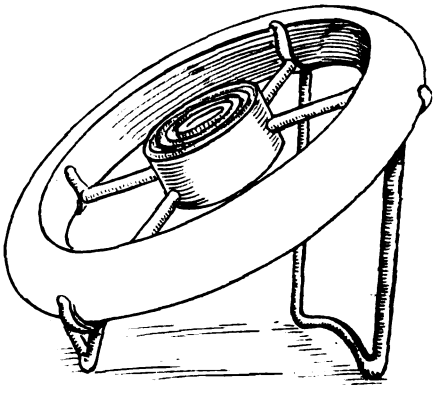


FIRESTONE COUNTER FIXTURE

demands proper display as much as, if not more than, any other. All of which already is known. But to carry along the original idea, goods well displayed require fixtures for displaying them, which, apparently, is not so well known, at least to a large majority of dealers.

Slowly, however, the idea is being borne in upon the retailer that it is not possible to display goods on shelves or counters or in boxes (closed boxes be it added) or in drawers, and that the goods themselves are in the majority of cases their own best advertisement. Show cases are a little better, though it is not always easy to dispose wares in a showcase so that they will appear to the best advantage; besides, there are cases without number where the possibility of closer examination by a prospective purchaser would have resulted in a sale. Which, of course, emphasizes once more the necessity for display fixtures.

Really wise accessory dealers appreciate the necessity, and a few of them employ fixtures that leave little to be desired, as far



TIRE DISPLAY WITHOUT FIXTURES

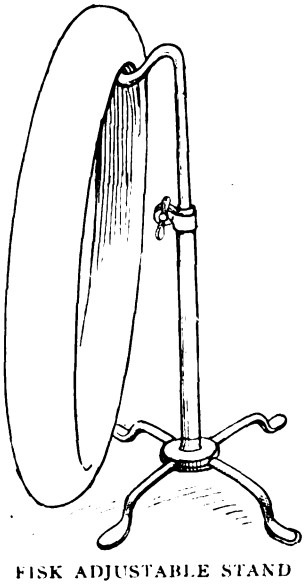
as their effectiveness in displaying wares is concerned. Also, the small hardware dealer in a small town, who just has taken on automobile accessories as a "side line" appreciates it, as do the majority of department stores, and unless the exclusive accessory dealers and the automobile dealers who sell accessories, awaken to the real needs of merchandizing, the hardware men and the department stores are likely to get a much bigger slice of the profit that goes with the selling of accessories, and much of it will come through the use of effective display fixtures.

Initiative of the Tire Makers.

That there are many methods of displaying accessories in a "fetching" manner was evidenced at the recent automobile shows, though of all the manufacturers represented no group appears to have "gone into" the matter as deeply as have the tire makers and as a result few goods were displayed to better advantage. Manifestly, tires are not the easiest thing in the world to display in an attractive manner. They are heavy and unwieldly and they all look more or less alike, except as regards their treads, which may symbolize anything the maker may choose, from buttons to basket weaves or from chains to channels. Still, few of the tire makers whose wares were displayed experienced particular difficulty in making effective exhibits, and what is even more to the point, almost any of the fixtures employed are as easily applicable to the retail dealer's store as it is to an automobile show.

The easiest day the dealer can take advantage of advertising and promote sales is by gratifying the public's curiosity and exhibiting the wares in such a way that they can be plainly seen. Again, there appears the necessity for proper fixtures, no matter what the particular wares may be—whether they are tires or trunks or carpet tacks. In-

THERMOID TIRE AND TUBE STAND



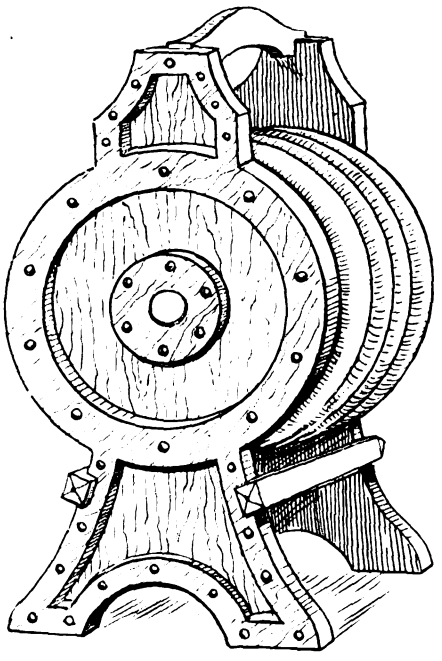
cidentally, it is a psychological fact that the average individual will buy what he sees if he sees it in the right light, and it is the purpose of the store fixture to hold goods up to his view where he cannot very well miss them.

Ingenuity Only Is Necessary.

But to get back to tires, though it is not exactly easy to display them in an effective manner, it may be easier than is supposed. Greenery in the showroom always helps; it gives a restful background. And quite naturally, where the salesroom is devoted to the sale of tires exclusively, rubber plants are the most fitting decoration of the kind that can be chosen. Growing plants of any kind, however, lend a "happy" touch to the interior of almost any showroom.

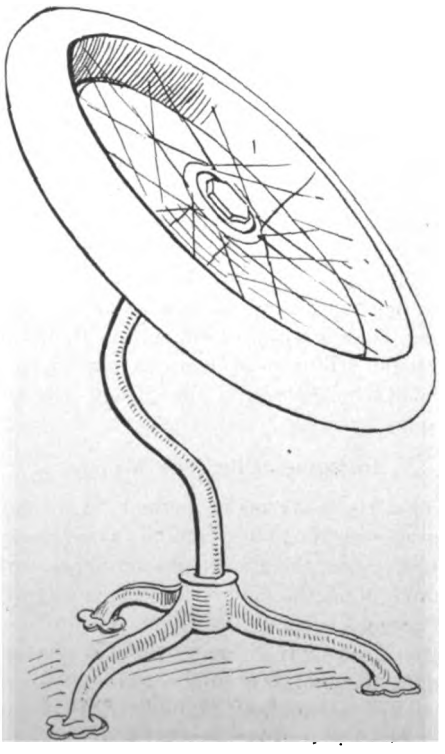
Digitized by Google

Where tires are shown in a dealer's store along with the heterogeneous mixture that goes to make up the stock, they, as well as anything else, may well be displayed and displayed well with the aid of a little ingenuity and possibly a few "properties," and occasionally even without them. They can be arranged so as to show themselves and at the same time form an effective decoration, and nothing more complicated is needed for a display of the kind than a few lengths of silk ribbon. For instance, at the New York show, the Goodrich company had a more than ordinarily effective display of the kind. There were two pyramids of tires, one on the other, and the



FISK ADJUSTABLE STAND

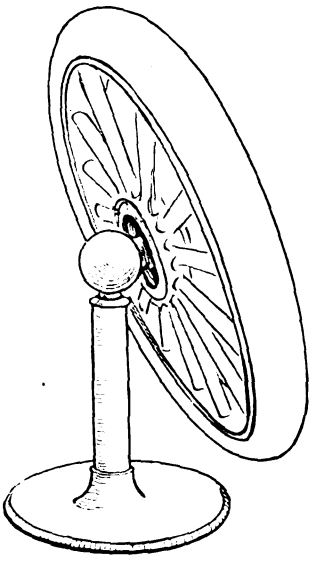
only visible and actual means of support were the tires themselves and a few lengths of ribbon. The ribbon was tied in bow knots where the tires came together, and in addition to giving stability to the uprearing, added a touch of beauty that helped draw attention. Needless to point out, it would be a very simple matter to arrange a display of the kind in almost any store or window. Show window displays, by the way, can be made just as effective with the aid of special fixtures, as can any other kind, whether the fixtures be just plain ribbons, as they were in the Goodrich display, or whether they be more pretentious devices. A pyramid of the kind presented by the Goodrich company shows to advantage either in the show window or on the salesroom floor. It is not merely decorative, but unusual, and therefore tends to compel notice.



Floor Stands Stable and Effective.

The method of displaying Diamond tires was scarcely less effective, and was calculated to withstand as much handling as the tires would stand without causing salesmen to have any of the symptoms of heart fail-

ORNATE U. S. TIRE RACK



ure regarding the stability of the whole under unusually hard prodding by more or less interested spectators. In its simplest aspect, it was merely a couple of circular platforms, one over the other with the tires arranged triangularly upon them, the effect obtained being much the same as that obtained by the Goodrich display. Obviously a display stand of the kind would form an ideal device for a dealer's store, where, placed directly in the center, it could not fail to attract attention, it would be decorative to a degree, it would be stable, and it would be a simple matter to vary the ex-

EFFECTIVE WIRE WHEEL DISPLAY

hibit, and an easy one, by changing the brand or the type of tires displayed.

In not a few cases, much of the appeal of the display lies in the shape and appearance and finish of the fixture almost as much as it does in the wares displayed. In fact, the theory behind the use of display fixtures indicates that the appearance of the fixtures themselves should be second only in importance to the efficacy of the devices as "silent salesmen." An example in point is the display stand employed by the United States tire company, an ornate structure lone in quartered oak and highly finished. It was by far the most pretentious of the display fixtures, but withal it was not obtrusive. In construction, it is not unlike those types of desk bookcases designed to hold a number of volumes upright before the occupant of

LEE ADJUSTABLE WHEEL HOLDER

the swivel chair; like such bookcases, its contents are disposed between the two end sections in such a way that any one may be removed for inspection without the necessity for disturbing the others.

The use of either of these three methods of display naturally presupposes the use of the floor as a resting place, and each has as its object the elevation of the tires to a position where they may be more easily inspected or handled. Which fact serves to bring to notice that tires may be displayed even on a counter and that fixtures for the purpose are available.

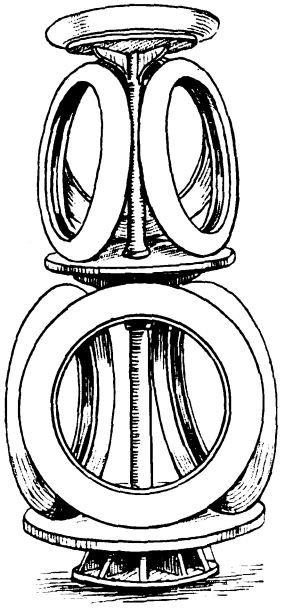
Simplest Form of Tire Holder.

Of all the devices of the kind, probably the simplest is nothing more than a hollowed block of wood finished as the dictates of the maker may fancy—for the device is easily made by any one who is handy with tools. The hollowed portion may be scooped out with a gouge to fit the diameter of the tire for which the block is intended and the tire will hold itself in place with

Digitized by Google

a partially inflated tube in the casing. Obviously, symptoms of instability can be eliminated by fastening the block to the counter with a single screw hidden by the tire itself. The device is not new, of course, and already has been put in use by a number of progressive tire dealers. The block forms a compact support that is cheap and may be used with equal facility on the counter, the floor or in the show window. Which is true, also, of very nearly all the other counter display fixtures that have been evolved.

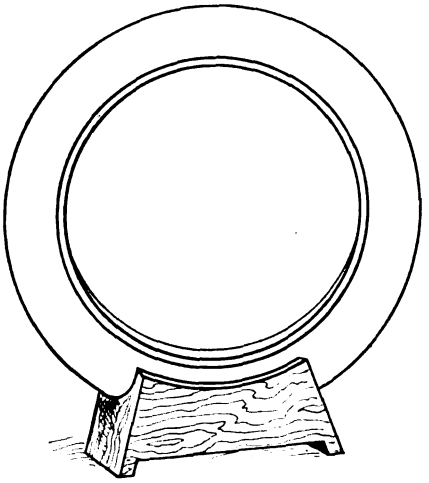
Simple Wood Block Counter Fixture.



Firestone tires, for instance, were displayed on a triangular stand than which few were simpler, though it served its purpose admirably. Complicated devices defeat their own object in a measure by detracting from the goods that are displayed upon them, and for effectiveness simplicity is essential. But instead of increasing the difficulty of devising devices of the kind, the necessity for simplicity really makes their construction that much simpler; a polished board with a nail in it upon which to hang a tire will form a more effective display than will a complicated device with a whole lot of nickel-plated and spidery arms stretching to every point of the compass. Of course, the board should be tastefully finished and the nail should be an ornamental spike.

Elaborating somewhat upon the method devised to display Firestone tires, the Fisk company employs a small, substantial stand carrying an adjustable rod with nothing more complicated than a hook at its extremity upon which to hang a tire. Being adjustable, the stand is suitable for the display of almost any size tire from a miniature aeroplane shoe to the largest size tire constructed for the heaviest cars. It is quite simple, and it is equally simple to alter the display frequently.

Killing Two Birds With One Stone.



Somewhat different and a little more pretentious is the fixture devised by the Thermoid company; it serves a dual purpose. The fixture has a "hub" which is really a tube receptacle, and from the hub four arms radiate to an outer rim which supports the tire; a third leg holds the fixture firmly. Thus, the single device serves to display both the tube and the tire, though despite this fact it scarcely can be termed complicated. Like all the other devices, it is suitable alike for use on the counter or in the show window and is equally effective in either place.

Carrying the display a little further by showing the tire as it actually appears on a wheel is a comparatively common expedient that has the additional advantage of showing also the rim and its method of attachment. Naturally, the construction of a stand of the kind involves greater complication, for it necessitates the use of an axle stub. Lee tires were shown on a stand of the kind, the axle stub being mounted in a

DIAMOND FLOOR TIRE STAND

ball and socket joint at the top of the standard, thus permitting the angle of the wheel and tire to be changed to fit requirements. In a show window, for instance, the wheel and tire can be arranged at only a slight angle to the standard, thus permitting the display of smaller wares beneath the wheel. The display stand at the Standard Welding Co.'s exhibit differed from the other only

SIMPLEST FORM OF TIRE SUPPORT

in that the base consisted of three feet triangularly arranged and that it mounted a wire wheel and tire. A slight bend in the standard permitted the display of the wheel at the proper angle and made the whole less liable to topple over.

All of these devices are simple; even a poor mechanic could make almost any of them at slight expense and in a very short time. And if, as the old saying goes, "what is sauce for the goose is sauce for the gander," and what is good for one is good for the other, it would seem that those dealers who have been progressive enough to see the value of display fixturs and to go to the length of using them are in a fair way to leaving their less progressive brothers—exponents of the dusty shelf principle—far behind.

Oriental Air at Hartford Show.

Hartford is in the throes of its sixth annual automobile show. The exhibition opened on Saturday evening last, February 8th, under the auspices of the Hartford Automobile Dealers' Association and the First Infantry, C. N. G., and, as has been the case with previous shows, is staged in the drill hall of the State Armory. The show will be in progress for one week—until Saturday evening next, February 15th.

The decorative artist traveled far to obtain his setting. India supplies it, and the drill hall "dressed up" looks for all the world like a little patch of that Far Eastern country. One entire side of the hall is covered with a single canvas depicting the Temple Taj-Mahal, and each of the other three sides are covered with paintings of smaller dimensions, all of which blend to complete the picture. And neither are the flora and fauna missing, for vines and flowers are there, which if not truly Indian are at least foreign to Connecticut, while Bengal tiger heads supported on spears serve to bear the shield-shaped signs which announce the various products. Artificial stars and blue sky cover the ceiling.

In the matter of exhibits, 43 different makes of vehicles, both pleasure and commercial, are shown by 30 dealers; with the accessory dealers the list of exhibitors reaches the even hundred.

The cars on display are: Baker electric, Buick, Cadillac, Cartercar, Case, Chalmers, Chevrolet, Columbia, Cutting, Detroit electric, Fiat, Flanders electric, Ford, Henderson, Hudson, KisselKar, Lippard-Stewart, Locomobile, Lozier, Maxwell, Mitchell, National, Oakland, Overland, Packard, Paige-Detroit, Peerless, Pierce-Arrow, Pope, Premier, Rambler, Regal, Reo, Standard electric, Stearns, Stevens-Duryea, Stewart, Studebaker, Stutz, Waverley electric, White, Winton, Woods electric.

Carbide to Start Balky Engine.

A wrinkle that is not difficult to apply and which, on occasion, will help to start a balky motor is to put a little carbide into water directly under the carburetter air intake and crank the motor while the acetylene gas is rising. Ordinarily, a lump as big as a hazel nut will give off enough gas to do the trick.

ELECTRIC ROAD LOCOMOTIVE TO HAUL FREIGHT

Ponderous Double-ended Machine That Drives Through All Four Wheels and is Steered Like a Steamboat—Curious Combination of Motor Construction and Standard Railroad Equipment, Including Air Brakes.

For thirty years the Pennsylvania Railroad has been hauling freight cars through some of the streets of Jersey City, N. J., by brute force—that is to say, they have used horses. Cars arriving at the Exchange Place terminal consigned to the American Sugar Refining Co., Colgate & Co., and other big concerns located along Hudson, Essex and Washington streets have been hauled out of the yards and through thick street traffic by eight heavy draught animals. Going up Essex street there is a very heavy grade, as railroad grades go, which begins on the very sharp curve from Hudson street. In bad weather, and when loads are exceptionally heavy the cars are dragged up the grade by means of block and tackle. The horses are inconvenient and expensive, the process of delivering cars slow and unsatisfactory in bad weather, and altogether the arrangement is one which has been fervently condemned, especially in late years, because of the increasing difficulties due to heavy cars and street traffic which steadily is becoming greater.

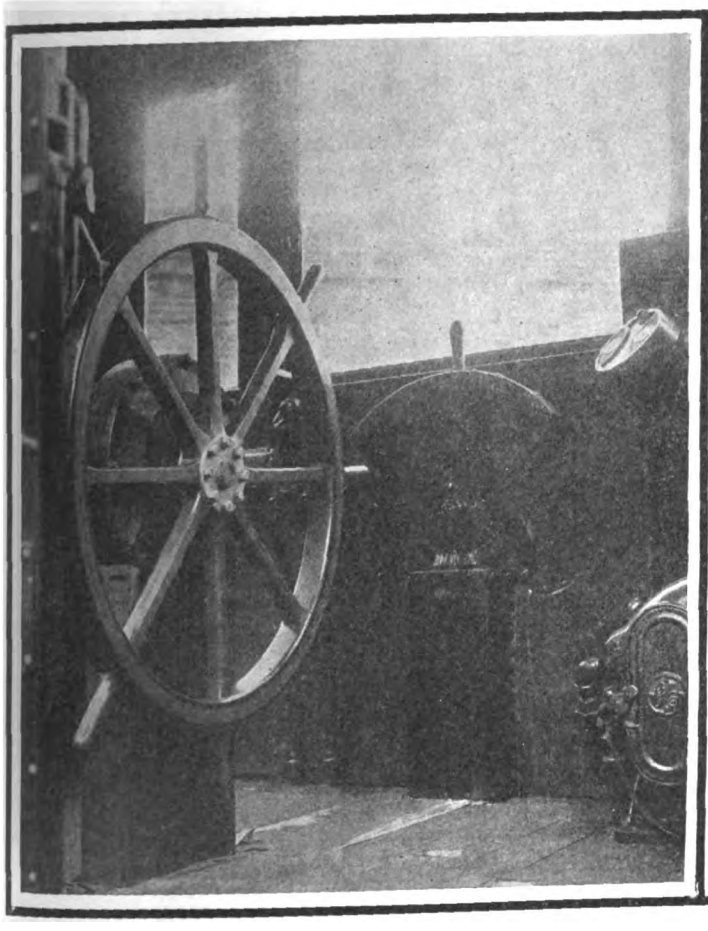
The sharp curve makes it impossible to use a locomotive, even if the intermittent character of the work warranted the detailing of an engine for the purpose, and the railroad company has watched with much interest the increasing efficiency and power of motor trucks. About a year and a half ago a number of tests were made with the heaviest machines available, with a view to replacing horses with motor trucks. None of the cars was found equal to the work, all being too light. The tests served as an inspiration, however, and Tracy V. Buckwalter, chief electrical engineer at the Altoona shops of the P. R. R., addressed himself to the task and brought out the tractor shown in the accompanying illustrations.

PENNSYLVANIA RAILROAD'S MAMMOTH ELECTRIC TRACTOR COMPARED WITH BAGGAGE COACH, SHOWING ITS SIZE

"Tug o' War" Test Indulged in.

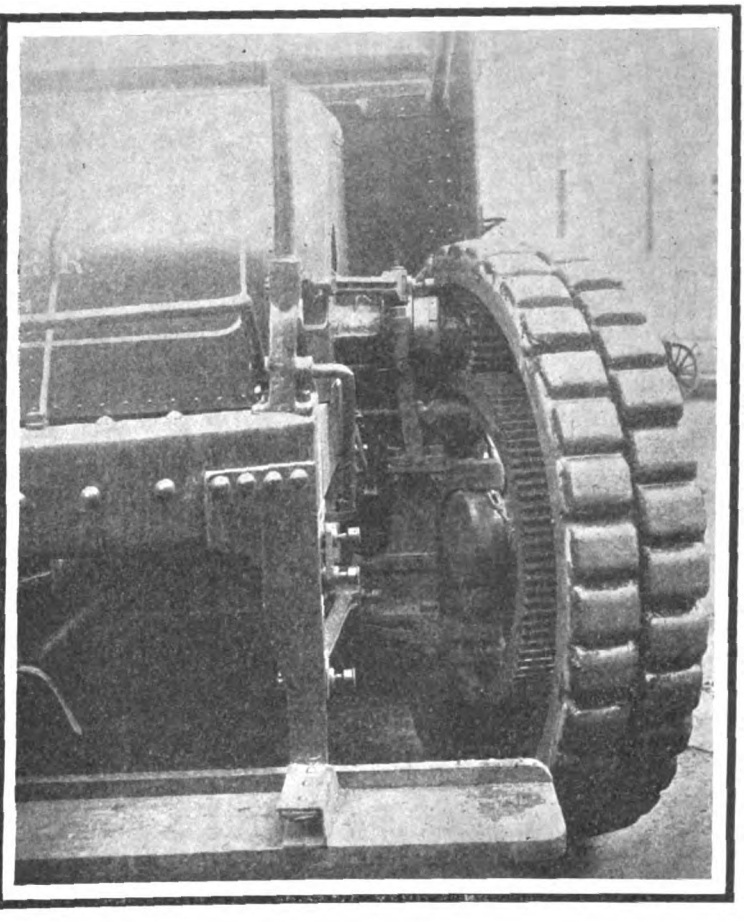
While the machine has not as yet been put into active service, having been at the terminal only a couple of weeks, serving as a "training ship" for the two men who will operate it, tests made at Altoona indicate that it is fully equal to the work for which it was built. The most spectacular trial was a sort of shoving match with a locomotive. Two loaded gondola cars were placed together with the tractor coupled to one end and a standard switching engine at the other. At a signal, steam was turned on in the locomotive and electricity in the tractor, and after a short period of silent straining the locomotive and the two cars were slowly pushed back by the tractor. Of course, the tractor was working under more favorable conditions, in a way, than the locomotive, for the torque of a pair of electric motors at low speed is tremendous, while the steam engine was limited by its boiler pressure. However, heavy pulling at slow speed is what the tractor is designed for, so the test was considered very satisfactory. The speed is eight miles an hour.

Digitized by Google



The Buckwalter tractor is a battery-driven machine, having two electric motors, of a nominal rating of 10 horsepower each, but with an overload capacity of something like 250 per cent., placed under two hoods, one at either end of the car, and driving all four wheels through double reduction gearing, having a total reduction of 40 to 1. All four wheels are steered also, and one of the most striking peculiarities of the tractor is that instead of the conventional automobile type of steering wheel there is a regulation tug-boat spoked wheel in the middle of the cab. The enormous weight of the machine—28,850 pounds—made imperative the employment of a steering gear of great leverage, and the marine type of wheel is found to answer the purpose satisfactorily. The length of the tractor is not excessive, being 22 feet over all; the tread, however, is wide, there being 6 feet clear inside the wheels, so that they can run easily outside the rails, even on curves. The wheel rims are a foot wide, making the tread, as ordinarily measured, seven feet. The wheelbase is 12 feet and the wheels, which are 60 inches in diameter, are fitted with rubber block tires bolted on in sets of three blocks with steel bases. The tires are dual and have a total width of 10 inches.

In keeping with its role as a locomotive, the tractor is fitted up with a complete air-brake equipment, including a pump driven by an individual electric motor, with the usual hose connections to carry air to the cars to which it may be coupled. The drawheads are of the standard P. R. R. type, automatic, with safety outside uncoupling levers.



Duplicate Control Elements Provided.

Instead of the usual springs they are cushioned by pneumatic cylinders capable of resisting a pressure of 10,000 pounds before "bottoming" the pistons. Being a double-ender down to the last detail, the controlling and braking apparatus is duplicated in the cab, so that whichever way the driver faces, he has the levers at his right hand. Each control lever works in a slot in a sector; the forward half of the swing controls the three forward speeds and the rear half three exactly similar speeds in the opposite direction; the slot is not continuous, however, but is divided into two sections by a bridge which stops the lever in a vertical position, and in order to reverse it is necessary to pull the handle out of its socket and insert it in a similar socket which comes just at the opposite side of the bridge when the lever is in neutral position. This makes unintentional reversing impossible. In making a sudden stop it is unnecessary to turn off the current; as soon as the air brake is applied, which is done in the usual locomotive way, the controller lever flies back to neutral. In backing up for a short distance the driver shifts his handle to the reverse side of the sector, but in making a return trip or for running any distance he shifts it to the opposite side of the cab, moves over to the other side of his steering wheel, and at once that which was backward becomes forward, and still the driver has all his controls in exactly the same relative positions as before. In addition to the air braking system there is an auxiliary hand brake, operated by a small brass hand wheel, which may be used in case of the failure of the air. In view of the reliability of the standard air-brakes, however, this contingency is regarded as a remote one. The braking action is extremely prompt and effective, and it is an easy matter to stop the tractor within a distance very considerably less than its own length when moving at maximum speed. It is stated that in an emergency a stop can be made within three feet, if there is good holding ground for the wheels.

Not the least interesting feature of the machine is the system by which all four wheels are utilized as drivers as well as steerers. The mechanism is divided into two separate sets, one for the two driving wheels at each end, which are exactly dupli-

"PILOT HOUSE" AND CONTROL MECHANISM

INGENIOUS DRIVING AND STEERING AXLE

Digitized by Google

cates and work independently, though drawing current from the same battery. The motors are of General Electric manufacture, series wound, 85 volts, and each drives through heavy spur gearing to a countershaft carrying a differential. The countershaft is extended laterally, the ends projecting from massive bearings and carrying spur pinions which mesh with large spur gears bolted to the wheels; the large gears are of such diameter that there is just room for the pinions between them and the wheel rims. The shafts are so located that a line drawn through the pivot center of the steering knuckle passes through the center of the pinion. Provision for the movement due to steering is made by mounting the pinion on a spherical joint on the shaft end, the joint being so constructed that while the pinion cannot turn on the shaft, it can swing to any angle within the limitations of the joint, and as the axis upon which it swings coincides with the steering pivot axis, there is no difficulty in transmitting power even when the wheels are deflected. The action of the joint will be better understood, perhaps, if it is considered as a universal joint with gear-teeth cut in its periphery. The wheels are of cast steel. The inner peripheries of the large gears are used as braking surfaces, the bands expanding against them in the usual way.

Huge Storage Battery Equipment.

Current is supplied to the motors by an Edison battery of 80 cells. The cells are the largest manufactured by the Edison company and have a capacity of 450 ampere hours, which is sufficient to give the tractor a range of about 40 miles on a single charge under ordinary working conditions—considerably more than is likely to be required, so that there is a margin for occasional long periods of continued hard work. The battery is carried under the cab, where it is readily reached through steel doors on the sides.

The tractor is carried on semi-elliptic springs, and the combination of big wheels, rubber tires, well-calculated springs and great weight results in surprisingly easy riding over rough ground. There is very little noise heard when riding in the cab, and when standing at a little distance the machine scarcely can be heard. An electric gong and an air whistle provide ample means for signaling, however. While the curious combination of mechanisms is apt to leave one somewhat confused as to whether the machine is an automobile or a locomotive, the question is settled by the fact that each end is decorated with an orthodox New Jersey automobile license tag, which presents an incongruous appearance just above the coupling and air-brake connections.

MINNEAPOLIS SHOW SET IN LIFELIKE RUSTIC SCENERY

Painting of Minnehaha Falls, With Natural Tree Trunks, Placed Beneath Illuminated Canopy—In National Circuit.

Although all of the exhibits were not on view—for the Minneapolis exhibit is this year a national circuit exhibit for the first time and not a few of the cars to be displayed were in transit from Chicago—the opening of the fifth annual show of the Minneapolis Automobile Trade Association in the Minneapolis State Armory on Saturday evening last, February 8th, was nevertheless auspicious. Monday morning last, the two train loads of cars from the Windy City arrived and the bare places of the opening night were quickly filled, completing the exhibition, which will remain open until Saturday evening next, 15th inst.

Of motor cars and motor car appurtenances there is little missing, for the 45 dealers who are exhibiting have on display the productions of some 60 different factories, while accessories are displayed by a half-hundred other dealers.

And if the ranks and the files of the exhibitors are complete, then the same term must apply to the decorations. The lofty ceiling has been converted—by virtue of the use of not an inconsiderable amount of blue bunting—into a blue sky in which myriad lights glitter, outlining the ceiling girders. The entire back wall of the armory is covered by a mammoth mural painting of Minnehaha falls and a degree of naturalness is lent to the setting by virtue of a cunningly contrived foreground of natural trunks and branches of trees. Large landscape paintings figure in the decorative scheme of the other three walls, and trailing southern smilax hides from view the railing which bounds the balcony. Eight life-size statues of the "Spirit of the Automobile," a young woman bearing a motor car wheel illuminated with purple lights, are placed at vantage points on the main floor and a mammoth seal of Minnesota, also illuminated, faces the main entrance.

The cars on view are: American, Stutz, Premier, Paterson, R-C-H, Hudson, Speedwell, Cutting, Jackson, Stanley, Packard, Imperial, Luverne, Richmond, McIntyre, Marathon, Mercer, McFarlan, Franklin, Knox, Cartercar, Chevrolet, Little, Henderson, Pathfinder, Hupmobile, Mitchell, Paige-Detroit, Apperson, Stoddard-Dayton, Cadillac, Lozier, Stearns-Knight, Buick, Nyberg, Regal, Stevens-Duryea, Fiat, Inter-State, Moon, Flanders, Auburn, Pierce-Arrow, White, Penn, Overland, National, Garford, Firestone-Columbus, Colby, Case, Velie, Ford, Locomobile, Lambert, Buckeye, Moline, Krit, Cole, Kisselkar, Oakland, Oldsmobile, Studebaker, Maxwell, Winton, Abbott-Detroit, Herreshoff, Peerless, Westcott, Chalmers, King, Detroiter, Empire, Havers, Marion, Rambler, Metz, Staver, Reo, Marmon.

Two Buildings for Youngstown Show.

Having acquired such proportions that the Auditorium no longer is able adequately to house it, the annual Youngstown (Ohio) automobile show—the third under the management of the Youngstown Automobile Dealers' Association—which was inaugurated on Saturday evening last, February 8th, was partially housed in an annex specially built for the purpose and which is connected with the larger building that houses the greater portion of the show. While decorations in the shape of bunting strips and streamers serve to hide bare walls and ceilings and render both new and old buildings eye-pleasing, the effort of the management has been directed more toward the exploitation of vehicles than to "garnishing" the buildings, and to this end aisles have been made wide and display spaces large, so that each of 35 different makes of motor vehicles, cars and trucks, is shown to best advantage. The vehicle displays are made by 20 dealers, while three others exhibit accessories.

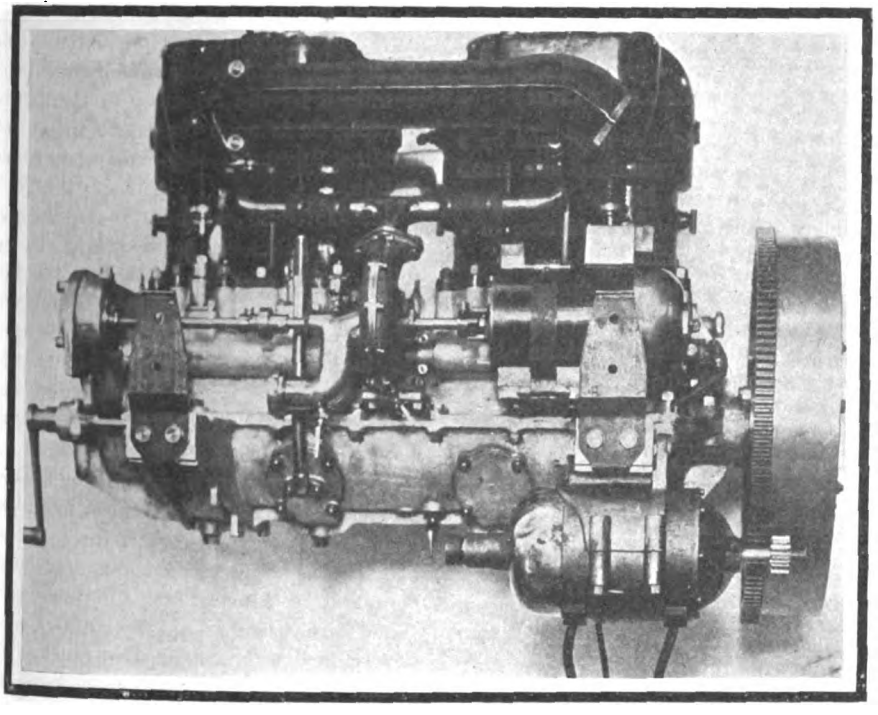
The cars on view are: Regal, Moon, Buick, Little, Cole, Packard, Hudson, Rauch & Lang, Oldsmobile, Oakland, Reo, Standard electric, American, Overland, Auburn, Service truck, Michigan, McFarlan, Kline, Peerless, Studebaker, Baker electric, Federal truck, Warren, Moon, Avery truck, Cartercar, Cadillac, Winton, Chalmers, Paige-Detroit, Ford, White truck, Koehler commercial, Mercer.

Cooper Comes Close to Dirt Record.

Earl Cooper, driving a Stutz car on the one-mile track at Fresno, Cal., on Monday last, February 10th, covered 200 miles in 3:28:5.2, which is dangerously close to the dirt track record of 3:28.04 for the distance, made by Louis Strang at Columbus, Ohio, in July, 1909. Cooper's time was made in a time trial run under A. A. A. sanction and under the auspices of the Cooper brothers, who are the California distributers for Stutz cars.

Perceptible Improvement in English Humor

British humor may not be so sad, after all. As witness: One Englishman describes a bumpy road as shocking, and further rises to remark that a new 'bus that has been put in use in London is so covered by patents that presumably there will be no room for advertisements.



Digitized by Google

CARING FOR ELECTRIC STARTING EQUIPMENT

The Burden That the Owners' Ignorance Places on the Dealer and How Study Will Make It Lighter for Both—Peculiarities of Series Motors Made Plain—Rushmore System as an Example of Simplicity.

(This is the eighteenth of a series of articles designed to make clear the electric lighting and engine starting systems in use and to render easier their care and repair by the dealer and owner alike.)

The formal adoption of any electric lighting and engine starting system by the manufacturer of a car naturally presupposes a degree of simplicity in the system that will preclude the necessity for any more "fussing" on the part of the dealer or the owner than is necessary. Assuming even that the owner really likes to "fuss" with it, which means that he likes to take care of it, to clean it and to make such minor adjustments as from time to time become necessary, he is likely to be more than perturbed if the "fussing" is a necessity and is not merely an excuse for working off some of his own surplus energy.

RUSHMORE MOTOR AND GENERATOR, SHOWING METHOD OF MOUNTING

Why Simplicity is Necessary.

There are two reasons, therefore, for obtaining the greatest possible degree of simplicity. The first of them is to reduce to the minimum the amount of care and adjustment that actually is necessary and to make the care and adjustment easy of accomplishment by the "man in the street." And the second of them is to reduce the amount of possible damage that can be done by unknowing fingers in prying into apparatus which, under the circumstances, would be better let severely alone.

"Fussing" that Burdens the Dealer.

Not that it is hard for any one endowed with enough intelligence to operate an automobile to learn how to take care of an electric lighting and engine starting system; it is simple, though the statement has been reiterated so often that it is getting like to the story of the boy who cried "Wolf!"—no one takes any notice of it or it is taken for granted, which amounts to the same thing in the end, so far as the actual acquisition of knowledge by the owner is concerned. Also, in the end, the dealer almost invariably bears the burden.

How does the owner's anxious, though none the less harmful, "fussing" place the burden on the dealer? Suppose, for instance, that John Smith purchases a car from a local dealer and that it is equipped with a fearfully and wonderfully constructed lighting and starting system that would defy a Philadelphia lawyer to unravel—which it is not, of course, for there are no such systems. But just suppose that it is. Forty miles from nowhere in particular, Smith discovers with a pang that his lights are growing dim; he stops his car and his motor to remedy the defect in his clumsy way, if he can, and an even worse calamity appears in the refusal of the electric starter to extort a sympathetic chortle from the engine, when, dispairing of disposing of the gloom shed, figuratively, by his lamps, he endeavors to be on his way. So he gets out his hibernating crank and cranks up and drives home and to the dealer from whom he purchased the car; maybe he puts candles in his head lamps in lieu of the deceased electric bulbs, which expedient is not altogether unknown.

Failings of Household Electricians.

That is to say, he drives first to the dealer, if he is wise. If he is not wise, he drives first to some itinerant electrician whose fund of knowledge consists in knowing how to hang electric bells and door openers and wire burglar alarms. If the so-called electrician admits his inability to cope with the intricacies of the system all is well and good; there still remains an even chance for its recovery under proper hands. Generally, however, tainted money looks just as good to him as does any other kind and he proceeds to "chuck a bluff" to the detriment of the system and the depletion of the owner's pocketbook. Of course, he does no good, and if he does no harm more is the credit to him; he may be an electrician, after all.

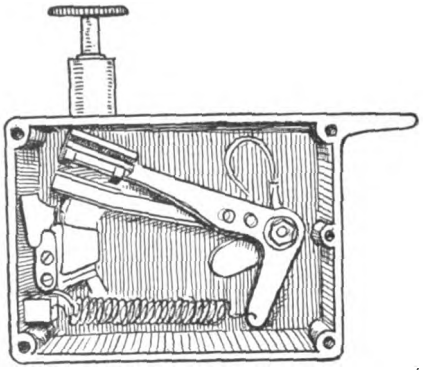
Doubling the Repairman's Work.

Generally, however, the fraternity of household electricians is worse than useless in such predicaments and the automobile owner would do well to shun its members, for, as a rule, it is beyond their ken just why the makers of such apparatus persist in sticking to construction which to their minds is so palpably wrong. They proceed to "fix" it; and no one who has had any experience with them can reasonably doubt that they are great little fixers—of a kind. The dealer is the logical person to whom the motorist should turn, and right here becomes apparent the burden the dealer must bear.

In nine cases out of ten, all the Smiths

Digitized by Google

that ever attempt to remedy lighter and starter troubles without knowing just how to go about it, make matters a great deal worse; they almost invariably do the wrong thing at the wrong time. Which means, of course, that in addition to straightening out the difficulty that causes the cessation of activities of the apparatus in the first place, the dealer has also to clean up the mess that has been left by the owner by reason of his ignorance. He has virtually a double portion of work to do.



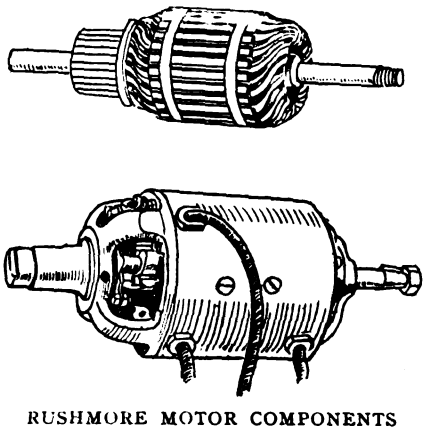
Real Complexity Non-Existant.

In this respect, it is only fair to add that the average dealer is fully able to cope with the difficulties, provided only that no serious breakdown has occurred—that the wiring is not burned out in either the generator or the motor, for instance. It has been borne in on dealers within the past few months that they must be able to do so if they are to maintain their reputation for that everything which is embraced by the word "service." Logically, the dealer wants a simple electric lighting and starting system, for with one he knows that the amount of damage the owner inadvertently can do will not be as great as can be done with a highly complicated one. And it goes without saying that the owner wants a simple system, for he wants the assurance that he can take care of it if necessary. Needless to add, for it already has been pointed out many times in the seventeen preceding articles which have appeared in Motor World, none of the existing systems is too complicated for the average person easily to "learn by heart," though he cannot expect to learn by sitting idly by with folded hands in silent contemplation. Nor will mere printed instructions alone suffice; he must "dig in" and learn by experience.

Elimination of Rods and Wires.

Simplicity in the concrete concerns the method of attaching and connecting the apparatus quite as much as it concerns its "internal economy"—the parts that seldom are seen or touched or thought of. Which means, briefly, that, in so far as is possible with proper operation and due regard for strength, rods and wires and brackets and other parts must be eliminated. The truly simple system would be one in which the motor and generator are integral with the gasolene motor, everything is automatic in the fullest sense of the word and attention of any kind never is necessary. But the millenium has not been reached, and until it is there is little likelihood of such a system being perfected, for they all embrace machinery of some kind and machinery always requires attention.

Still, notable attempts at a full solution of the problem have been made, and among them, the Rushmore electric starting system, manufactured by the Rushmore Dynamo Works of Plainfield, N. J., probably comes nearer to the real answer, apparent in the elimination of as many parts as possible, than does any other. The generating portion of the system already has been described in Motor World under date of November 7th. Therefore, suffice it to say that the generator is a small, compact ma-



RUSHMORE STARTER SWITCH

chine in which the output is governed by a series coil of iron wire contained in a small "bucking" coil inserted in the field automatically by the increasing resistance of a housing a-top the dynamo casing.

Unusual Disconnecting Method.

The starter is distinctive by reason of the fact that, though it drives the gasolene motor through the intermediary of gearing cut in the flywheel, thus necessitating that a pinion on the motor shaft be enmeshed when the engine is to be started and thrown out of mesh when the motor has started,

RUSHMORE MOTOR COMPONENTS

it is devoid of the usual rods, etc.; its appearance is unusual, as may be judged by the accompanying illustration, which shows both the generator and the motor attached to a heavy Simplex motor. In fact, its construction and its characteristic are so unusual as to make it of more than ordinary interest, particularly inasmuch as it has only just been placed upon the market.

In its simplest aspect, the motor is plain series wound and is completely enclosed so as to make it dirt and moisture proof. The armature is drum-wound, is heavy and is mounted in ball bearings. The peculiar part of the design lies in the construction of the armature and commutator and the method of mounting, both of which features best can made plain by digressing slightly to delve into theory a little.

Characteristics of Series Motors.

It is a well-known fact that the field magnets of any dynamo or motor exert a powerful solenoid action to draw the armature into line with the pole pieces. In fact, this effect is so pronounced that any ordinary motor or dynamo thus will give a silent pull fully as great as can be obtained with the same weight of copper and steel in any other form of simple solenoid or magnet construction. Similarly, it is quite as well known that when the load is removed from a series wound motor it tends to run away with itself and will do so unless restrained by the cessation of the exciting current. It is upon these two simple laws that the Rushmore starter depends for operation.

The shaft and commutator are elongated about 1¼ inches, so that by means of a long coiled spring contained in the hollow front end of the shaft the armature normally is forced out of line with the field poles about 1¼ inches, and thus the one-inch pinion mounted on the end of the armature shaft normally is forced out of mesh with the gearing on the flywheel.

The starting switch, which is quite as important and quite as ingenious as any other part of the mechanism, has three contacts, the arrangement being shown by the accompanying illustration. On the first of them the armature is partly short-circuited. On the first movement of the switch, the circuit is closed to the battery through a resistance step which limits the current flow to 150 amperes at 6 volts. This current all passes through the series motor fields, but, owing to the short circuit across the armature, about half the current is shunted around the brushes. The other half gives the armature a slow but very powerful torque, which is hardly noticeable to the eye but which is practical assurance that the gears will enmesh properly. On the last switch contact, the armature shunt is removed, the series resistance is cut out and with the pinion then in full mesh with the gearing on the flywheel the motor is thrown in full series upon the battery.

As long as the motor is driving the engine, the load current through the series field magnetizes the field so that the armature is held in the working position with the gears enmeshed. At the instant of the first explosion, however, which takes the

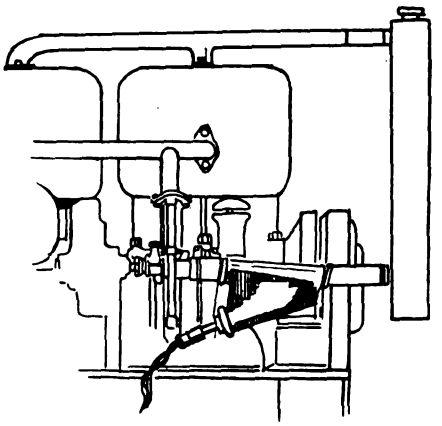
Digitized by Google

load off the electric motor, it proceeds to run away with the gears still enmeshed. But as quick as a flash, the removal of the load results in the battery current drawn dropping almost to zero, which so reduces the magnetic pull upon the armature that the coiled spring at the end of the shaft forces the gears out of mesh and the armature continues to spin silently at its normal speed of 2,400 revolutions a minute as long as the foot button is depressed. It is doubtful if a simpler starting system could be developed, for there is absolutely nothing to get out of order and, barring the little care that any electric motor requires, it never need be touched from one season's end to the next.

Care of the Motor Made Plain.

As regards the care of the system as a whole, omitting the care of the generator, which already has been outlined, the starting switch should be cleaned occasionally, for it is bound to collect a certain amount of road dust. And even though the dust may not effect the operation of the device, it may contain abrasive particles which in time will cause undue wear. Therefore, it is well periodically, say once a month, to brush out any accumulations of dust. Sliding contact is provided in the switch, thus making the contacts self-cleaning, though if the mechanism is so placed that oil can work in and onto the contacts trouble is likely to ensue. Oil can be removed with a cloth dampened with gasolene. The cover of the case is held in place by means of four screws, one at either corner, and in assembling, care must be taken to see that the lock washers beneath the screws are replaced or the screws will work out under vibration, thus exposing the mechanism.

As the motor is in use only at long intervals and then only for a few moments at a time, wear will be negligible and there is little that will require attention. The brushes should be examined from time to time to make certain that they are the proper length and that they make proper pressure on the commutator, for there are few things which will work greater havoc if permitted to obtain than weakened brush springs or brushes that are so short that they do not properly touch the commutator. Sparking and burning are the result, and the only remedy then is thoroughly to sandpaper the commutator.



Cleaning the Commutator Surface.

Of course, where the commutator appears unusually dirty, it should be cleaned, a cloth wrapped around the finger and dipped in gasolene being one very good way of tackling the job. If the cleaning reveals deep scratches or cuts on the commutator, these should be removed with fine sandpaper—No. 00—applied while the armature is rotating and after the brushes have been removed.

Where the motor has been run for a long time without any attention whatsoever, it most likely will do more good than harm thoroughly to overhaul it by removing the brushes, and then the opposite end plate, when the armature may be withdrawn, leaving the field open and free for the removal of accumulations of dust, etc. To clean away the dust, a soft brush should be used, care being taken not to disturb the windings. In reassembling, great care must be taken to see that the wires are properly attached, if, for any reason they have been removed. Probably there will be no necessity for removing them, in which case the cleaning operation will be very simple.

To Heat Motors in Cold Garages.

That those who store their cars in unheated garages may not be subjected to the

DECO WARMER, APPLIED

annoyance, to say nothing of the possible expense, of frozen cooling systems, the Dayton Equipment Co., of Dayton, O., has perfected an ingenious type of electric heater for which manifold advantages are claimed. It is styled the Deco-Warmer and is designed to be permanently attached in the cooling system of the motor after the manner shown by the accompanying sketch. In its simplest aspect, it is merely a small electric heater made integral with a short length of piping and attached in such a way that the cooling water passes through the pipe and in doing so comes in contact with the heated surfaces. Energy to generate the necessary heat is obtained from any ordinary electric light circuit, either alternating or direct current being suitable.

After the device has been attached, it is merely necessary to screw the plug, which is a part of it, into an electric light circuit; as there are no moving or wearing parts in the device, it is calculated to operate efficiently practically for a life-time. The heater is applicable to any motor, whether thermo-siphon or pump cooled, its effect being to cause a thermo-siphonic circulation in either, thus maintaining all the cooling water warm and facilitating easy starting. Needless to add, it is absolutely fireproof.

"Kerb" Light the Latest in London.

Step lights and extension "trouble hunting" lights are fairly common, and now comes the curb light, or, as it is styled by the British taxicab company that has adopted it, the "kerb" light. It is nothing more or less than an ordinary electric lamp fixed low on the forward axle, but the theory behind the innovation is a little more complicated. Lamps placed in the ordinary position, it is explained, cause an annoying glare in the "blankety" fogs with which London is afflicted, whereas the placing of one lamp—the one ordinarily nearest the driver—on the front axle obviates this trouble and at the same time illuminates the "kerb" to facilitate "landing." The other lamp is placed in the usual position beside the driver, and there has been found nothing in the motor vehicle laws to conflict with the unusual arrangement.

Grain Alcohol for Cooling Solutions.

Although wood alcohol as a medium for lowering the freezing point of water is extremely effective, for which reason it frequently is used in connection with the cooling water of a motor car, its use is not to be recommended, since in the presence of heat and air it forms formic acid, which readily attacks the brass and copper which enter into the construction of the radiator. Pure grain alcohol (ethyl alcohol) is equally as effective as the wood alcohol and is very much less liable to have a corrosive effect.

Springs that Cause Valve Breakage.

A not infrequent cause of excessive valve breakage arises from the use of valve springs which are too heavy. Where a slow speed motor is caused to operate at a speed above normal, stiffer valve springs sometimes are substituted to quicken the return of the valve to its seat and the constant "thud, thud" strains the valve stem to a point where breakage is the natural result. The remedy is the replacement of the heavy springs by lighter ones.

Knock Not Due to the Engine.

A deep toned, heavy knock which sounds for all the world like a connecting rod or a main bearing knock—for it can be perfectly regular and be more in evidence when pulling with high gear in mesh—sometimes is caused by the front engine supporting bearing where three-point suspension is employed. Before dissassembling the motor to look for the knock, it is well to tighten this bearing, making use of a bushing, if necessary.

1,023,383. Clock for Automobiles and the Like. Henry W. Matalene, New York, N. Y. Filed Dec. 9, 1910. Serial No. 596,431. (Means for actuating the winding mechanism by rotating the dial.) 6 claims.

1,023,393. Fender for Automobiles. Waldo F. Perez, Tampa, Fla. Filed May 15, 1911. Serial No. 627,233. (Basket shaped catcher designed to attach to side frame members.) 2 claims.

1,023,414. Armor for Vehicle Tires. Jeremy B. Coonrod, Rock Rapids, Iowa. Filed Feb. 25, 1911. Serial No. 610,892. (Armor built of solid rubber with metal supports.) 3 claims.

1,023,454. Pneumatic Tire for Vehicle Wheels. Elery Emmerson Black, Detroit, Mich. Filed Mar. 4, 1911. Serial No. 612,243. (Non-resilient base portion to which a resilient tread portion is attached by means of a flange connection.) 2 claims.

1,023,470. Carburetter. Raymond S. Hill and Oliver P. Underwood, Indianola, Iowa; said Underwood assignor to Herman C. Mills, Des Moines, Iowa. Filed Feb. 28, 1910. Serial No. 546,507. (Spray nozzle opening controlled by the air pressure in the mixing chamber.) 4 claims.

1,023,471. Automobile Number Plate. Peter M. Hoffman, Chicago, Ill. Filed July 24, 1911. Serial No. 640,143. (Means for attaching plate to the radiator.) 1 claim.

1,023,487. Differential Gearing. Otto Zachow, Clintonville, Wis., assignor to Four Wheel Drive Auto Company, Clintonville, Wis., a Corporation of Wisconsin. Filed May 8, 1911. Serial No. 625,674. (Means for providing a differential lock.) 4 claims.

1,023,493. Spark Plug. Franz Bartl, New York, N. Y. Filed Nov. 19, 1909. Serial No. 528,875. (Both electrodes covered with insulating and refractory material.) 5 claims.

1,023,516. Pneumatic Wheel. William W. Guest, Alameda, Cal. Filed June 8, 1911. Serial No. 632,014. (Tread formed of many rubber plugs mounted on pistons which operate in dash pots.) 4 claims.

1,023,546. Internal Combustion Engine. Madison F. Bates, Lansing, Mich. Filed June 27, 1910. Serial No. 569,010. (Piston formed in two sections bolted together; the upper section contains the piston rings.) 1 claim.

1,023,552. Dual Ignition System. Richard H. Cunningham, New York, N. Y. Filed Jan. 29, 1910. Serial No. 540,781. (Multiple circuit breaker.) 1 claim.

1,023,553. Change-Speed Gearing. Paul Daimler, Cannstatt, Germany, assignor to Daimler Motoren-Gesellschaft, Stuttgart, Germany. Filed June 13, 1911. Serial No. 632,882. (Clash gear transmission.) 4 claims.

1,023,554. Tire. Milton E. Davis, Canastota, N. Y. Filed June 9, 1910. Serial No. 565,994. (Tire moulded so that a linked netting will fit snugly over the tread.) 8 claims.

1,023,565. Air Pressure Creating Device for Gasolene Supply to Engines, etc. William P. Herbert, Philadelphia, Pa. Filed Mar. 24, 1911. Serial No. 614,594. (Pump incorporated with the valve operating mechanism.) 2 claims.

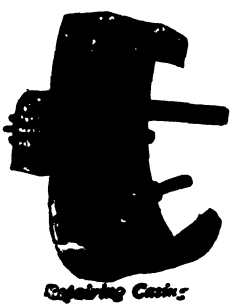
1,023,580. Anti-Skid Device. Douglas J. Martin, New York, N. Y. Filed Jan. 20, 1911. Serial No. 603,634. (Endless chains attached to each other by means of clamps and means for taking up the slack.) 4 claims.

1,023,598. Vehicle Wheel. Louis K. Stephens, Dallas, Tex. Filed Feb. 20, 1911. Serial No. 609,644. (Spring hub.) 2 claims.

1,023,644. Exhaust Muffler. Joseph Hall, Manchester, England. Filed Nov. 22, 1910. Serial No. 593,743. (Arrangements of baffle plates.) 1 claim.

1,023,666. Cover for Pneumatic Tires. Lucien Liais, Paris, France. Filed Sept. 21, 1910. Serial No. 583,052. (Means of stiffening tire casing.) 3 claims.

1,023,682. Emergency Brake. William Ray Reno, Louisville, Ky. Filed Feb. 16, 1911. Serial No. 608,930. (Runners designed to be dropped before the rear wheels and upon which the wheels run, the runners being chained in position.) 2 claims.



1,023,804. Driving and Steering Mechanism for Power-Operated Vehicles. Iram W. Bould, Pittsburgh, Pa. Filed May 15, 1911. Serial No. 627,135. (Drive shafts can be connected or disconnected from wheels by dog clutches.) 3 claims.

1,023,810. Automobile Steering Guide. Claude Bugg, Clinton, Ky. Filed Sept. 6, 1910. Serial No. 580,476. (Pointer on steering column which indicates the relative angle of the steering wheel.) 3 claims.

1,023,811. Variable-Speed Transmission Mechanism. Leon J. Campbell, Chicago, Ill., assignor to James T. Healy, trustee, Chicago, Ill. Filed June 17, 1911. Serial No. 633,699. (Tilting keys replace orthodox dog clutches on lay shaft.) 10 claims.

1,023,848. Combined Tank Bracket and Step for Motor Vehicles. Russell Huff, Detroit, Mich., assignor, by mesne assignments, to Packard Motor Car Company, Detroit, Mich., a Corporation of Michigan. Filed Oct. 30, 1908. Serial No. 460,301. (Straps attaching to the car frame support both gas tank and steps.) 5 claims.

1,023,859. Vehicle Spring. William S. Lee, Detroit, Mich., assignor, by mesne assignments, to Briggs-Detroiter Company, Detroit, Mich., a Corporation of Michigan. Filed Nov. 24, 1911. Serial No. 662,242. (Platform spring suspension.) 3 claims.

Exploding Casing

TIRE CUTS run casings. They admit moisture to the carcass, cause the fabric to rot and weaken, grow larger—end in blowouts. You can repair **CASINGS** and **INNER TUBES** anywhere in 15 minutes, better than a Repair Shop can do—and for *one cent.*

Universal Auto-Vulcanizer
Patented

A practical vulcanizing outfit complete, with enough repair gum to make 40 patches. It weighs 3 pounds and can be carried in the tool box. **Simplest and most satisfactory device for eliminating tire troubles that has ever been devised**

Absolutely automatic. Place the patch—attach the Vulcanizer—put in the gasoline light it. No further attention required. In 15 minutes the job is done.

It *can't burn, scorch* or *injure* tube or casing. It *can't* get out of order. It *can't* fail to do its work. So simple, anyone can operate it. The Universal Auto-Vulcanizer saves its cost a *hundred times* over in trouble and expense.

Price Complete, **$4.00** Ready for Instant Use
Guaranteed Satisfactory or Money Refunded

Luxury and Utility
combined in the
National

A woman can step directly from her home into her luxurious National closed car.

She finds it clean, warm and comfortable.

She touches one button to start the motor.

A touch on another button turns on the lights.

The entire mechanism of the car is under her immediate control; she need make no exertion or effort: her gown and coat and hands are not brought into contact with anything that may soil them.

In every way the National should appeal to a woman as being many times superior to an electric.

For her comfort and delight we fit the closed cars with a foot mat, umbrella holder, baggage compartment, speaking tubes, vanity box, mirror, flower vases, etc.

Five Models, Improved Series V, $2750 to $3400

Following are a few of the salient features of National cars:

Long Stroke (4 7-8x6) flexible and noiseless Motor with enclosed valves.

Left-Side Drive.

Center Control.

Gray & Davis Electric Starter, easily operated by simply touching a button with foot.

Gray & Davis Dynamo Electric Lighting System.

Bosch dual double Magneto.

12-inch Turkish Upholstery.

Electric Horn.

Adequate Baggage-carrying Compartment concealed in body but easily accessible.

Tire pump, integral part of the motor. Inflates a tire in three minutes.

128-inch Wheelbase.

Adjustable, ventilating and rain vision Windshield.

Multiple jet Carburetor.

Hoffecker steady-hand Speedometer.

Tire Carrier in rear.

Full-floating Rear Axle.

Easy-riding qualities unexcelled.

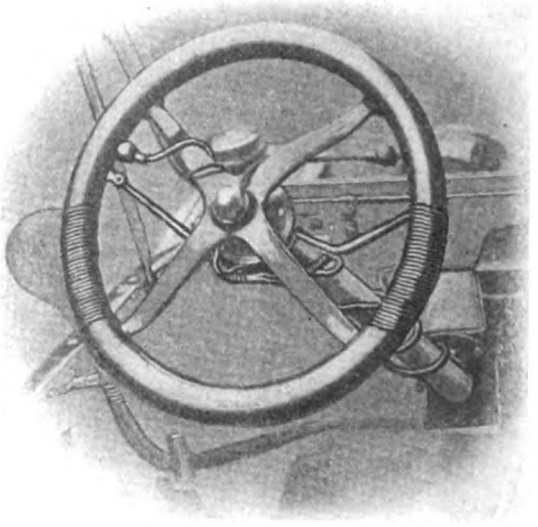
More and more dealers are grasping the sales possibilities of the Warm Hand Wheel, because of its appeal to comfort in winter driving. If you have still held back, then write to us---NOW.



Circuit Open

Every car that operates in the winter needs a Warm Hand Wheel as part of its necessary equipment. Every car owner who sees (or rather feels) it demonstrated, will quickly catch the idea and want the wheel.

It isn't an experiment we are offering you, but a tried and proven success, giving uniform comfort to the hands in all winter weather conditions.

The Warm Hand Wheel is heated by current from the lighting system or from batteries—or from the built in magneto on the fly wheel of the Ford. In all instances current consumption is small and cost of upkeep negligible.

The retail price is $15.00 and we will make a most attractive commission arrangement with you if you will simply write and say,

The Motorcycle Field

is growing by leaps and bounds and motorcyclists are good spenders for

ACCESSORIES

This promising field is splendidly covered by the

Bicycling World and Motorcycle Review

The Oldest Cycling Jonrnal in the Country

Attention is called to the fact that many manufacturers of automobile accessories can greatly widen their field by cultivating the motorcycling industry and to those who are not already familiar with the enormous volume of business now being done in motorcycles the facts will be a revelation.

The Bicycling World and Motorcycle Review is ready to tell you how you can reach this field at a minimum expense, and its service department will plan a campaign for you; prepare advertising copy and insure its circulation in every state.

If you make anything for motorcyclists

AN INTERESTING PROPOSITION

Generous Profits for Live Dealers

DEALERS—ANSWER THESE QUESTIONS:

Which Truck will give the most satisfaction to my customer?

The truck which is built to perform the service expected of it, and which possesses exclusive points of economy and superiority.

The A&R Motor truck represents accumulated results of eight years careful study and scientific development with the most severe road tests. Through these tests, it has been demonstrated that the A&R truck is more than capable of meeting every possible condition.

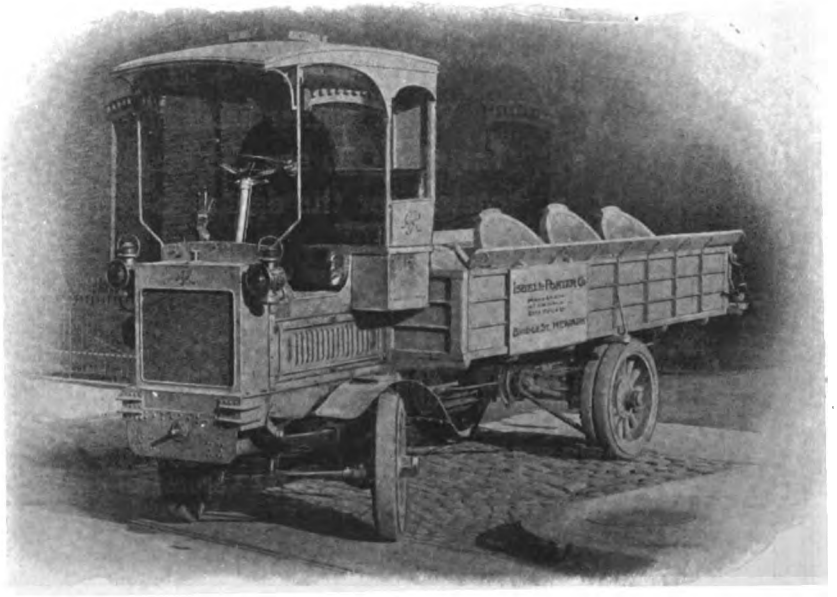
A&R CONSTRUCTION

"Study the lines": —They represent power and efficiency — far in excess of their rated load capacities, combined with minimum weight and great strength. Many features of the A&R truck are exclusive—collectively they represent the highest type of motor vehicle construction.

CAPACITY

Heavy service—three, four and five tons.

The demand for high grade motor trucks, already exists and will be further stimulated by our advertising assistance, and co-operation with the dealer. Write now telegraph us now for more complete information.



Which Company will give me the best co-operation, not only in the sale, but in rendering service to my customer?

The Company which is firmly and substantially established; thereby assuring permanence, situated to render service to owner and dealer, and willing to co-operate with him in compelling attention and consideration for the truck through publicity.

The Abendroth & Root Manufacturing Company, is an engineering corporation, whose products have been recognized standards throughout the engineering world for over forty-five years, thereby insuring sterling quality and dependable service for every A&R truck.

A&R SERVICE

A thoroughly equipped factory at Newburgh, N.Y., in close proximity to New York City, has a factory service department, where the most efficient co-operation is available to every dealer and purchaser of an A&R truck.

Livingston

Greatest Cooling Efficiency

Can't be Hurt by Freezing

IF you or your customers are troubled with boiling radiators or overheated motors, the chances are you need our assistance.

Livingston Radiators are so highly efficient in the performance of their cooling functions that their substitution nearly always means the elimination of heating troubles and considerable increase in engine power and car economies.
